General Lerch's report revealed that there were twenty or thirty thousand American officers and enlisted personnel handling some 350,000 POW's. In late 1942 and early 1943, when manpower was desperately needed, the prisoners were put to work on nontactical duties at Army posts, on the roads, in the laundries, and so on. From June 1943 through January 1944 German reverses in Africa increased the flow of prisoners to America. The Army therefore allowed enterprisers who had been unable to find free labor to contract for POW labor, provided that the War Manpower Commission representative certified both the contractor's need for labor, and the prevailing wage for the work done. This wage was paid to the United States Treasury; the prisoners who worked received only the agreed amount of eighty cents a day in canteen coupons. In 1944, the General reported, private contractors paid the Government twenty-two million dollars, exclusive of transportation, housing, and subsistence, for a total 10,181,273 man-days of labor, more than half of it agricultural. The Army saved an estimated eighty million dollars by using prisoners for its own work, making a total of one hundred million dollars profit for that year. Despite the opportunities for escape afforded by work on farms, the escape rate was only one hundredth of one per cent higher than that from the heavily guarded Federal prisons (it was .45 per cent). As for the charges of Nazis dominating and terrorizing their anti-Nazi fellow prisoners, Lerch pointed out that the "uncooperative" prisoners were always kept in separate compounds or camps and stated that any prisoner who asked for protection would receive it, and that for the year ending April 1945 there had been no murders or suicides that could be attributed to Nazi methods.

Another aspect of the POW problem came to light in September 1945; the *Christian Science Monitor* reported that some months earlier General Dwight D. Eisenhower '42 had cabled a request for five thousand anti-Nazi German prisoners to be trained as supervisory and operational police for the American zone of occupation. General Lerch's office sent out ten "screening teams" to the POW camps in the United States. They came back with a list of fifteen thousand prisoners whose records were "thoroughly anti-Nazi," including some who had spent years in concentration camps, and some of Hitler's '42 personal enemies. The selected Germans agreed to give up the privileges of whatever rank they had held in the German Army, and were started through a special series of courses for the purpose at Fort Getty, Rhode Island. The aim was to prepare two thousand non-Nazis for use in the civil administration, in addition to the five thousand for police work, in the American zone. Another development, which was classified "top secret" up to September 1945, was put into operation in December 1944: a program of "general re-education in all camps by radio, newspaper, and entertainment." "We armed ourselves with the truth," said Assistant Provost Marshal General B. M. Bryan, Jr. "We did not compete with Goebbels '41."

About four months after V-J Day, Lerch was to leave his Washington headquarters for assignment to a troubled area. In December he was ordered to southern Korea as military governor of the American-occupied part of that country, where General John R. Hodge '45 was in command of the American forces. (Bryan succeeded him as Provost Marshal General.)

The General responsible for the entire program was described as a quiet, spectacled soldier of scholarly manner. "The lawyer in General Lerch shows more than the soldier in the way he runs his shop. Every document that comes out of his office is drafted as meticulously as a legal brief. But his business is conducted with a rare informality and absence of red tape. Among his various memberships he values most an honorary one in the International Association of Chiefs of Police." A Methodist and a Mason, Lerch is a member of the Army and Navy Club in Washington. The Lerches' daughter, Janet, is married, and young Archer Lynn in 1945 is at West Point.

LILLIE, BEATRICE May 29, 1898- Actress

Address: h. Drayton Manor, Staffordshire, England

"Mistress of sophisticated slapstick," comedienne with the "Chaplinesque quality of wistful

BEATRICE LILLIE

frustration"—the British actress, Beatrice Lillie, has been an international star since the early 'twenties. Throughout these years, as surveys of printed comment indicate, she has remained, in the estimation of most drama critics, "one of the world's funniest gals." "With one dart of her eyes," wrote George Jean Nathan['45] in 1940, "she can spare a skit writer a dozen lines . . . [with] one little vocal squeak she can save the management royalties."

Beatrice Lillie was born Beatrice Lillie, on May 29, 1898. Her Irish-born father, John Lillie, and her Spanish-English mother, the former Lucie Shaw, had settled in Toronto, Canada, shortly before the birth of Beatrice Gladys, and there she and her older sister Muriel grew up. Mrs. Lillie, known in Toronto as a concert singer, envisioned a future for Muriel as a concert pianist, and for Beatrice as a soprano. The girls began their musical education early, and by the time the younger child was nine or ten a course in gestures was added to her lessons—rich gestures to accompany her singing, that would denote "sorrow and joy, birds flying, a bunch of grapes, farewell to summer, the ideas being subtly conveyed," explains Miss Lillie, "by delicate motions with the fingertips and outstretched arms."

The three Lillies frequently put their combined talents to the test, being addicted to entertaining their friends with "soireés." On Sundays Mrs. Lillie directed the choir in her church, Muriel played the organ, and Beatrice, until she became too liberal with her gestures, was a chorister. They appeared in local theaters, too, and once gave a tour of mining towns, accompanied by a small troupe. When the youngest member of the trio reached the age of fourteen she was sent to St. Agnes' College in Bellevue, near her home; but after a year of studying she concluded she preferred the stage. In 1914 she followed her mother and Muriel to England, and with great determination set about to establish herself as a serious singer of ballads, on the order of "I Hear You Calling Me" and "The Sunshine of Your Smile."

Time, and the whims of feature writers, have tended to confuse the details of Beatrice Lillie's final emergence as a comedienne, although the lady herself has described her London beginnings. After nearly a year of fruitless auditions she had the chance one day late in 1914 to be received by André Charlot, the thirty-two-year-old Frenchman who had introduced into England the so-called "intimate" revue, a small show that emphasized a clever cast rather than extravagant costuming and setting. Rather dispairing of her chance to impress this famous man, the young Canadian girl made up her mind to relax and at least enjoy herself. She tried out a few songs calculated to be amusing, for at home in Toronto she had found that, in a way she did not yet quite understand, she could convulse listeners, even church congregations when she was a chorister, by unconsciously interjecting a simple facial comment or gesture into a song or story. So, for the French producer that day in London, she sang such things as the ditty "The Next Horse I Ride On I'm Going To Be Tied On" and an Italian song with a few grapes and banana gesticulations. The net result of this venture, she says, was a three-year contract with Charlot for about fifteen pounds a week.

Beatrice Lillie started her career that October with a six weeks' tour of the provinces in the revue *Not Likely*, a production which eventually played in London, at the Alhambra, of which Charlot was then director. She sang, she says, "I Want a Toy Soldier Man," was embarrassed by her chorus costume, and failed to impress the reviewers. The producer next put the sixteen-year-old into his London production of *5064 Gerrard*, which opened at the Piccadilly in March 1915, almost simultaneously with the opening of the German Zepplin raids on England. She sang a number then new to Londoners, Irving Berlin's['42] song about wanting to go back to Michigan. It was with this song, theater chroniclers report, that Beatrice Lillie first "sparked" with audiences, although the young singer did not realize it that opening night until after she had gone back to her dressing room. For the next few war years she was "in everybody's act," in the Charlot revues *Now's the Time* (1915), *Samples* (in which she succeeded Mabel Russell in March 1916), and *Some* (1916).

Charlot had never given Beatrice Lillie any encouragement when she tried to be serious, and gradually she learned she was not very effective in straight roles, but was, in her own words, "a natural-born fool." On the last night of *Some* she gave expression to her inclination for deviltry, with the result that her antics in the chorus line caused her to be fined by an unsympathetic stage manager. Charlot, however, was pleased with the exhibition, and a part was written for Miss Lillie in his revue, *Cheep*, which opened in April 1917. After that Bea Lillie's clowning was a regular feature in Charlot productions: in *Tabs* (1918), *Oh, Joy* (a 1918 revue—revived in 1919—with music by Jerome Kern['42], originally called *Oh, Boy*), and *Bran-Pie* (a bright little 1919 revue in which, it was noted by *The London Times*, Beatrice Lillie was "as good as ever").

In October 1919 pictures of a slim languorous-looking girl appeared in newspapers over the announcement that "the popular Ontario singer," Miss Beatrice Lillie, had become engaged to the twenty-one-year-old Honorable Robert Peel, descendant of Robert Peel, Prime Minister to Queen Victoria and "creator" of London's famous police force, the "Bobbies" or "Peelers." The couple were married in January 1920, and the following December the actress gave birth to a son, named for his father.

The young bride's retirement from the stage was short-lived, however, for in April 1921 she reappeared in a non-Charlot production, the farce *Up in Mabel's Room*. This was followed by more Charlot: *Now and Then* (1921), *Pot Luck* (1921), and *A to Z* (1922). Then in October 1922 Beatrice starred in the *Nine O'Clock Revue*, of which her sister Muriel was the composer. Said to be the comedienne's best show up to that time, it ran about a year. At the end of the run in the winter of 1923, Charlot, in partnership with the American producer Arch Selwyn, decided to bring to New York what Noel Coward '41 has described as "a conglomeration of all the best numbers and sketches from the Charlot revues of the preceding few years." It was headed by three of Charlot's best-known stars, Miss Lillie, Jack Buchanan, and Gertrude Lawrence '40, who had got her start only a few years before by replacing Miss Lillie in a show when the star had been ill. (Also in this New York show was a comic named Eric Blore.)

Billed simply as *Charlot's Revue of 1924*, the show opened January 10, 1924, at the Times Square Theatre. There had been some skepticism as to how American audiences would react to British humor, but if there was any lack of appreciation after the show opened, it was not apparent in box office sales, and the performances of the leads skyrocketed them to international stardom. Dressed as Britannia, Queen of the Waves, Miss Lillie sang a song called "March with Me," a rowdy satire on Britain's sacred symbol of naval strength, in a manner that is still fondly recalled in play reviewers' columns today. Critics like Alexander Woollcott '41, Heywood Broun, and Percy Hammond wrote handsomely of the British comedienne. "She is slim, beautiful, and enormously funny, all at once," declared Broun the morning after; "I can think of no clown more comical than Beatrice Lillie," echoed Woollcott.

When the production closed several months later Miss Lillie returned to London to appear in the 1925 edition of the Charlot revues. After that, for the next fourteen years, she regularly moved back and forth between London and New York, a sort of transatlantic commuter. Theater histories and *Who's Who*'s list twelve productions for those years, as well as several seasons of cabaret work and appearances at London's Palladium. At the end of the 1926 run Miss Lillie remained in the States for the musical comedy *Oh, Please* (1926), in which Helen Broderick and Charles Winninger also played. (While only moderately successful in New York, the play had a prosperous run in Chicago.)

A revealing analysis of Miss Lillie's special comic talent was written by Stark Young while she was appearing in this play, generally considered to have been an indifferent musical. The play, wrote the critic "is a typical musical comedy. . . .But Miss Lillie takes it far otherwise; she gathers up all musical comedy and guys it to exhaustion. She is wayward with its romance, comic with its sentiment. The trouble, then, with her in such a position begins with her not being on its plane. . . .Miss Lillie does not take the piece as it takes itself." There are those who "burlesque its [musical comedy's] sacred transitions from joy to wistful sweetness . . . from frail two-minute suspense to complete bliss with ensemble effects from the company." But those musical comedy "debunkers" who went as followers of Miss Lillie were confused as to what she really "did think of affairs." But, Young continued, although there was no opportunity for her to display her skill, "she was as astonishing as ever. Her absurdity, her wit, her variety were not diminished, the imps and inspirations of her art were the same. She evidently belongs in a revue; but wherever she is, her comic gift is one of the best in the world; our delight in her is endless." As if in response, Miss Lillie herself said several years later: "I'd be lost in a typical musical comedy. In the first place the audience would expect me to burlesque my part. I know my own limitations and realize that I am best in a sketch in which I can invent my own business and do whatever comes into my head."

Shortly before this, in February 1925, Miss Lillie's father-in-law died, her husband succeeding him as the fifth baronet. The actress thus became Lady Peel, a circumstance which was to provide many anecdotes for Lillie followers. About a year later she adopted the sleek coiffure which has become her trade mark.

Miss Lillie appeared in New York in January 1928 for the Rodgers '40 and Hart '40 musical farce *She's My Baby*, with Jack Whiting, Clifton Webb '43, and Irene Dunne '45. After a period at the Palladium in London, the comedienne returned to America and, with Noel Coward, played for several months in Coward's *This Year of Grace*. While in this their first show together the two friends performed for appreciative audiences, inside the theater and out. Whenever "Beattie" and Coward put in an appearance together, at fashionable night clubs, charity balls, select ladies' clubs, it was a signal for a flood of requests to sing one of the duets from the show, "Lilac Time," an *opéra bouffe* burlesque. "We sang it everywhere," Coward writes, except "at small convivial theatrical parties, to which we were invited on the strict understanding that in no circumstances would we sing 'Lilac Time.'"

The transatlantic commuting began again at the close of this play, in which, reviewers said as usual, Bea Lillie had "never been so brilliant." Back in London she appeared in *Charlot's Masquerade* (1930); in New York and Chicago the next year she appeared with Ernest Truex '41 in *The Third Little Show*, introducing "Mad Dogs and Englishmen." In 1932 she was Sweetie, the nurse, in the Theatre Guild production of Bernard Shaw's '44 good-natured poke at the human race, *Too Good To Be True*; and at the end of the year she appeared with the bespectacled Bobby Clark in the urbane *Walk a Little Faster*, as, among other things, a madcap coed of 1906. She went back to London for Charlot's *Please* in 1933; appeared at the Palladium the following year; then turned up in New York and in Chicago in 1935 for *At Home Abroad*, with Ethel Waters '41 and

LILLIE, BEATRICE—*Continued*

Reginald Gardiner and his sound-effect imitations of wallpaper and of trains. She herself, in one skit, was a Mrs. Blogden Blagg buying two dozen double damask dinner napkins, and a lady on a moon singing the somewhat naughty "Paree." At the end of 1936 she was starred in the long-run *The Show Is On* with Gardiner and Bert Lahr.

During the spring of 1938 Miss Lillie played in *Happy Returns* in London; then in January 1939 she appeared in the States with Richard Haydn in her second Coward show, *Set to Music*. She opened the show by riding on the stage astride a white horse, but many critics found the rest of the production dull and unspectacular. Bea Lillie, however, in the words of Brooks Atkinson '42, was "more iridescently witty than ever." The star returned to London just before the outbreak of the Second World War, and until December 1944 did not cross the Atlantic again. During the five-year interval she entertained Allied troops in England, Europe, and the Middle East. She was awarded the Africa Star and was decorated by General Charles de Gaulle '40. In April 1942 her only child, Sir Robert Peel (the sixth baronet since his father's death in 1934), was killed in action with the Royal Navy near Ceylon.

After arranging details with Billy Rose '40, Miss Lillie, in December 1944, returned once more to the United States, to appear in the producer's *Seven Lively Arts*—and to receive on opening night a five-minute ovation from the audience. In addition to Miss Lillie, the play had been given all the trappings and build-up calculated to draw the public: the lushest first night since the start of the war—a twenty-four-dollar top for tickets, with champagne during the intermission—a reported production outlay of over a million dollars, including the money for refurbishing the old Ziegfeld Theatre, and a cast headed by Bert Lahr, Benny Goodman '42, Alicia Markova '43, Anton Dolin, and Doc Rockwell. The critics remarked that the general emphasis of the production seemed to have been on lavish mounting, rather than on the book, but they also found the show occasionally very witty and sometimes inspired. When otherwise, they wrote, it was pulled up by its bootstraps with each entrance of Miss Lillie, "not only the most expert comedienne on the stage, but by far the funniest." Miss Lillie was given the Donaldson Award (sponsored by *The Billboard*) for the best feminine lead in a musical show for her performance in *The Seven Lively Arts*.

Shortly after the opening of *Seven Lively Arts*, an English-made film of Miss Lillie's, *On Approval*, was released in New York—a reminder to American audiences that the comedienne also has made motion pictures. Her first one, *Exit Smiling*, was made in 1926, and in 1938 she played in an American movie, *Dr. Rhythm*, with Bing Crosby '41. Also, although she feels inadequate without an audience before her, she has made, over the years, numerous guest appearances on the radio, and in 1935 she was on a sustaining program for Borden's Milk Company. While the Second World War continues Miss Lillie has no hobby other than that of entertaining servicemen after her performances.

In the years since Beatrice Lillie made her debut in London a great deal has been written about her and many attempts made to analyze her special talent. Yet, despite the abundance of words produced, a very small percentage of them has been used to criticize her adversely: "too fey" is perhaps the strongest comment. "Her range is limited," St. John Ervine pointed out in the 'twenties, "but," he added, "within that range she is superb." "She is at her worst," the *Literary Digest* explained, "when the producer of the moment goes stumbling in for art."

"To write that Miss Lillie is funny only because she has a superlative comedian's technique is, of course, foolish," wrote Morton Eustis for the *Theatre Arts Monthly* in 1939. "The light of real comic genius sparkles from beneath her dark eyelashes, radiates from each of the unexpected angles of her countenance, and illumines every motion and gesture she makes. But she would never be the Mistress of the Absurd if her technique were less sure. . . .Miss Lillie never delivers the comic thrust of a speech without reacting to it by some movement, however imperceptible. . . .Let her toss her hand absurdly forward and her back will respond (when the laugh has subsided) by a sudden stiffening which throws her posterior into relief, gaining another laugh, which she will top by a slight, but surely a refined, wiggle. The 'line' of her performance [physical or vocal] . . . always has contrast." In connection with this, a comment by Harrison Dowd in 1931 is interesting: "Breeding is always apparent in her. . . .Her refinement is positively sensational, considering she is primarily a grotesque. Perhaps it is the combination of these opposites that creates the sensation. . . .It is like entering a drawing room and beholding a duchess performing like a crazy downstairs maid."

Although Miss Lillie is but five feet three inches tall, she seems taller, for she is slender and lithe, once commented the artist and writer, S. J. Woolf. "One lock of her dark hair, which is short-cropped in back, sweeps across her forehead. . . .From it a nose none too small juts out suddenly, giving an inquisitive look to her face. She has large blue eyes, a full mouth with sparkling teeth, and a clear British complexion."

When asked the inevitable question of how she goes about getting laughs, Miss Lillie will reply, "By being myself—and relying upon my audience to coach me." "I see life painted in terms of humor," she said once; "unless things are funny they are apt not to exist for me at all."

LITTLE, LOU(IS) Dec. 6, 1893- Football coach

Address: b. John Jay Hall, Columbia University, Morningside Hts., New York City; h. Barnstable, Mass.

"Teaching is a great art; and the best college teaching is usually found in the department of athletics," Professor William Lyon Phelps '43 wrote in an introduction to a book by Lou Little, Columbia University's veteran football coach. Hard-working Coach Little, who is said to be "the best-dressed, the best-informed, and one of the best-paid men in his business," kept his reputation as a teacher and strategist during a series of lean football years for Columbia. Now, in 1945, his Lions are again found among the leading teams in the United States.

The son of Michael and Theresa (de Dominick) Little, Louis Little was born in Boston on December 6, 1893, and brought up in Leominister, an industrial town of northern Massachusetts. He attended the Leominster High School and, in 1911-12, the Worcester Academy, and played on their football teams. According to *Look* Magazine, Lou was an iceman at sixteen and a brakeman at seventeen, and wanted to work in a bank. Entering the University of Pennsylvania in 1915, when he was twenty-one, the hawk-nosed six-footer played the 1916 season of varsity football as a tackle. His team was chosen to oppose the University of Oregon at the Tournament of Roses game in January 1917, but it traveled to California only to be thoroughly beaten. "Bob Folwell, Penn's head coach, was one of the sternest football disciplinarians I ever knew," Little recalls, "a fact for which I was frequently thankful during my Army career."

After the United States declaration of war in April 1917, Lou Little left school to enter an officers' training camp at Fort Oglethorpe, Georgia. On leave after being commissioned a first lieutenant, the New Englander was persuaded by Eddie Mahan, manager of the star-studded League Island Navy Yard football team, to join them for a game against the tough Boston Navy Yard squad. After three days of practice Lieutenant Little went onto the field as a tackle—and was brought off it unconscious. Later, as an officer of the Fifty-fourth Infantry, Little fought in France, taking part in the Meuse and Argonne offensives, and was promoted to captain. After the Armistice, General Pershing ordered the divisional teams to compete for the AEF football championship. Little and other stars of the past and future, without distinction of rank, joined in what he calls "the toughest football ever played anywhere"—in which a losing team stood in more danger of punishment from the buddies who had backed them with their entire pay, than from their opponents. The influence of that season was reflected in the rough intercollegiate football playing of 1919, which found Little again playing on the Pennsylvania varsity. It is not true, as often stated, that Lou Little was chosen for the All-America "dream team" of the best players in the country, but he was definitely among the football heroes.

Bernard W. Goldman

LOU LITTLE

Graduated in 1920, Little planned to enter the university's dental school, but changed his mind when he discovered that all dental instruments were made for right-handed users, not "southpaws" like himself. "In those days," the coach recalls, "the general plan of action of well-known football players upon graduation was: When in doubt, sell bonds." So Little tried, without much success, to sell bonds in Philadelphia. Then he turned to something he knew better—football, playing and coaching with the Buffalo professional team. The tackle saved his money, and was soon owner, as well as player and coach, of the Philadelphia Yellow Jackets, which Quentin Reynolds '41 describes as probably the best team in the country at that time. "It isn't easy to coach a professional team," Reynolds adds. "To begin with, each player on the team has been taught a different style of football and it requires a lot of oiling to make a smooth-running machine out of several excellent but poorly fitting parts. Lou did it, however, and his Yellow Jacket teams were noted for the devastating power of their attack." According to the *Literary Digest*, Little played the last ten games of the 1921 season with a broken wrist, having insisted on remaining in the line-up.

Concurrently, the energetic Little was coaching several school teams—among them LaSalle Academy, Philadelphia, in 1920-21, Villanova College in 1921-22, and Abington (Pennsylvania) High School in 1922-23. He had as many as four teams under his wing at one time, and two of them he never saw play. This continued until 1924, when Little was called to Georgetown University, the Jesuit institution in Washington, D. C., as head football coach.

(Continued next page)

LITTLE, LOU—*Continued*

The Georgetown squad was very light, and obviously unsuited to the high-powered charging tactics the coach had been using with the Yellow Jackets. He therefore worked out what Reynolds calls "a flashy, bewildering, now-you-see-it-now-you-don't type of attack, employing a double wing back formation upon which he built spinners and double reverse plays and a lot of other devices designed to fool rather than to overpower. His backs weren't big or strong enough to provide effective interference for each other, so he brought linemen out to help." He developed the lateral pass (which had been confined mainly to use behind the line of scrimmage) as a down-field operation after a run or a completed forward pass. Little used it as an offensive maneuver to pull the defending players up and out of position, before trying for an extension of the gain. Another of his techniques has been dubbed "the muddle huddle," to hide the formation they were going to use. In general, it has been said, Little "thinks primarily in terms of offense and demands alert, precise play."

After a year at Georgetown, Lou Little was also appointed director of athletics. His 1928 team, incidentally, was one of the lightest he ever worked with—but, with the help of some smart quarterbacking, he maneuvered it to beat New York University 7-2, when that powerful team had an All-America running back, Ken Strong, "running wild behind the magnificent blocking of Ed Hill." In five years Little's teams suffered only eight defeats; and in February 1930 the New Englander accepted appointment as the head of the Columbia University coaching staff, at a reported salary of about seventeen thousand dollars a year. Columbia was known as a "coaches' graveyard" because of the lack of football material and interest, which even the great coach Percy Haughton had failed to overcome. During Coach Little's first season in New York there were only sixteen players on his blue-jerseyed squad, as compared with the usual forty or more. That fall they lost their first important game to Dartmouth, 52-0, and dropped three others; but for the next four years they won all except one game each season. In this first five years Little's boys won a total of thirty-four games and tied two. In 1932 Little's colleagues elected him chairman of the Football Coaches Rules Committee; and he has remained the chairman, and a tireless campaigner for changes which he believes would improve the game, especially those adopted by the professional football leagues.

While preparing his squad to meet Dartmouth in 1931, Little entered the scrimmage to demonstrate how to shake off two opposing tackles at once. After fifteen minutes he became tired, forgot his own advice to keep the head and shoulders up, and found himself demonstrating the consequences—a vertebral fracture which kept him in a plaster cast for two weeks, and in a leather and steel brace the rest of the season. From his hospital bed Little plotted strategy and directed the team through his five assistant coaches and then left the bed just long enough to watch Columbia win, 19-6.

At the close of the 1933 season, when Stanford University invited Columbia to oppose them in the Rose Bowl on New Year's Day, Little reportedly thought it was a joke. The choice of Columbia to represent the Eastern colleges was widely criticized and ridiculed; the Columbians were called the Little Lions as much for their size as for their coach, while the huge West Coast teams were considered almost invincible. Accepting the honor, Little so arranged the thirty-five-hundred-mile trip that his squad was able to get in a practice workout on a good field each afternoon as it made its way across the country, finally settling in Tucson, Arizona, for eight days of concentration. He even brought along three hundred gallons of New York's fine water. The final score was Columbia 7, Stanford 0—and Little's boys repeated it in New York in 1936, and held Stanford to a scoreless tie in 1937.

After carrying off the Rose Bowl game trophy, Lou Little was recognized as, "at a conservative estimate, one of the three best football coaches in the country." This reputation has endured, for his teams are "always outmanned, and usually outpowered, but seldom outfought and never outthought." In 1939 he was elected president of the American Football Coaches Association. *Look* reported in November 1942 that up to that time Little never had produced an undefeated team, "yet almost every month he is offered a new job at a larger salary. He always declines, graciously but firmly, saying, 'I have spent sixteen years at Columbia and they have all been happy ones. What more could any coach ask?'" 1943 may have strained the Little philosophy a bit, as the Columbians lost every game they played; but the coach was given the Touchdown Club award as the man who had done most for football in that year. Little's 1944 team was an improvement, to the extent of winning two games in the season; but his 1945 team, sparked by seventeen-year-olds Lou Kusserow and Gene Rossides, swept on from victories over Lafayette, Syracuse, and Yale to beat Colgate for the second time in thirteen tries. The 1945 campaign ended with victory over Dartmouth in November. Having bowed only to Pennsylvania, the Columbia Lions ran up a record score of 251 points, its highest total for a season since 1931, when 237 were tallied in ten contests.

Little is described as truly interested in football as a means of "making the boys better citizens," rather than as an end in itself. Not only does he insist that his players maintain a good scholastic standing and observe the amenities of a rounded social life, but, in his words, "I am in touch with the boy's instructors on the academic side. I know what subject he likes and in what subjects he is not so proficient. Frequently I take pains to look into his family history to find whether he is an only son or a member of a large family, what the financial circumstances of his boyhood have been, whether he has been popular or not with his mates in school. I have reports on his general make-up from the freshman coach. I observe him in spring practice or, if he has been with another squad during the spring, I get in touch with the other coaches. All of these point the way to the boy's general characteristics and personality."

This is quoted from *How To Watch Football* (1935), written by Little and Robert Harron, which sports columnist Bill Corum called "the most interesting and valuable" book on football that he had ever read. Little's ideas have also been expressed in another book, *Lou Little's Football* (1934), written with Arthur Sampson, and in lectures and articles in numerous magazines. In September 1945 he began a weekly series of televised football talks as NBC's *Friday Night Quarterback*, to continue through the Rose Bowl game.

The spectacled, strongly aquiline-nosed coach stands six feet tall and weighs two hundred pounds. He is said to roar like a reasonable imitation of the Columbia lion at practice sessions in Baker Field, criticizing sharply every movement of every man—and to talk like a friendly professor off it. "A football team isn't a machine," he has said. "It's a unit composed of eleven kids. . . .If a boy lost an important game for me, I wouldn't make him feel as if the world had ended." On the other hand, Little has expressed his disapproval of those who lose complacently. "Lose with a smile, certainly, but the smile should be a bit forced."

The coach and Mrs. Little, the former Loretta L. Donahue, live in a New York apartment and have a stock and produce farm in Massachusetts, where, besides farming, Little enjoys landscape gardening. He is a member of the Racquet Club of Philadelphia, the Oster Harbors Club of Cape Cod, and the Circus Saints and Sinners and Barnsbees Luncheon Club in New York. His church affiliation is Catholic, and he is not enrolled in any political party. A left-handed golfer, Lou enjoys "all activities of competition, particularly those of physical contact," and both Littles listen regularly to dozens of radio programs, including the *Lone Ranger*. According to *Look*, Little's hobby is buying clothes, and in November 1942 an inventory of his wardrobe listed forty suits, thirty pairs of shoes, and five hundred neckties.

LOESSER, FRANK (HENRY) (lĕs′ĕr)

June 29, 1910- Song writer
Address: h. Hollywood, Calif.

"One of the brightest lights in Hollywood song writing," Frank Loesser collaborated on songs like "I Don't Want to Walk Without You, Baby," and "Jingle, Jangle, Jingle," and was known as a clever lyricist before joining the Army of the United States in the Second World War. Now he is better known as "the GI's own songwriter" and "the Army's one-man hit parade," the author of "Praise the Lord and Pass the Ammunition" and "Rodger Young."

Although he made his success in Hollywood, Frank Henry Loesser is a New Yorker by sentiment as well as by birth—that date is June 29, 1910. His parents, Henry and Julia (Ehrlich) Loesser, were natives, respectively, of Prussia and of Austria. Henry Loesser was a well-known piano teacher who had accompanied the famous soprano Lilli Lehmann. Frank's half-brother Arthur Loesser is a distinguished pianist and critic, former accompanist of Mischa Elman '45, and later head of the piano department of the Cleveland Institute of Music. Among the Loesser family and friends, Frank's songs are considered "very nice, but of course they're not music." He began being "different" at an early age: he never learned to read notes, although he plays the piano by ear, and he did not get along well in school.

Entering kindergarten with his older sister Grace, little Frank spent three years cutting out paper dolls before going on to the first grade. Later he entered the Speyer School and went on to the Townsend Harris High School, both of which were for "exceptionally gifted" pupils. He tells that he never studied or did homework, and was also addicted to practical jokes, with the result that he was dropped from Townsend Harris before graduation. Frank attended the commencement exercises, however, because one of his cousins was being graduated, and his surprise at discovering that he had won the art prize was no greater than the principal's when the boy came up to claim it. (Earlier, he had won the harmonica championship of New York City.) At fifteen young Loesser entered the College of the City of New York, the only institution which would admit him. But C.C.N.Y. soon dropped him, too, for "flunking everything but English and gym," and for polishing the nose of a bronze statue in the main hall. The dean was not impressed by the fact that Frank was on the swimming team and was writing the music for a college show.

Young Loesser designed and printed Christmas cards for sale to the people he knew, and combined his talents as a waiter-piano-player-caricaturist at a Catskill resort. With his eye on a newspaper career, he got a job taking classified advertisements for the New York *Herald Tribune*. Later he worked for *Women's Wear* as knit goods editor, and in early 1929 "F. H. Loesser" was signed to political cartoons in the Tuckahoe (New York) *Record*. That June Walter Winchell '43 recorded in his "Things I Never Knew Till Now" that "Frank Loesser, who writes special ditties for vaudevillians, is now city editor of the New Rochelle *News* and is only eighteen!"—an item that brought Loesser five hundred job applications, "mostly from old ladies." When this new little paper failed, the youth returned to New York and got a job as press agent for Tiffany Pictures, which starred Mae Murray. He thought

FRANK LOESSER

up a series of remarkable publicity stunts for them, most of which got him into trouble.

Concurrently, Loesser was writing song lyrics to music by his friend William Schuman '40, now a distinguished composer and director of the Juilliard School of Music in New York. Many were sold, but only one was published. Frank and a Joe Brandfon somehow got a year's $100-a-week contract with the music publisher Leo Feist, who never put out any of their works. Loesser and Schuman continued their collaboration on songs for night club and vaudeville routines. "No matter when I'd come home," Loesser's sister recalls, "he and Bill Schuman would be working on songs." Finally Frank got a chance to do lyrics for a musical, which was called the *Illustrators' Revue*. Opening in January 1936, it closed after four nights.

Until the depression, Frank's adventures and misadventures with jobs meant no real hardship, for his widowed mother was in comfortable circumstances. At that time, however, the family lost all their money, and Frank did any work he could get, including screwing the tops on bottles of insecticide. "There really seemed no place for me," he recalls. He got his meals by acting as a spotter for a chain of restaurants, which paid seventy-five cents plus the cost of a meal for reports on the food and service. "I used to eat twelve times a day," he says. "When you're poor, you're always hungry from walking around so much." Loesser did get a chance to do some vaudeville songs for Lita Gray Chaplin, and later he and Mrs. Chaplin's accompanist, Irving Actman, joined forces as a songwriting team. They arranged with Ann Minor, who owned the small Back Drop cafe, to sing and play their songs every night in exchange for dinner. One dull evening the owners brought in all available persons from a near-by theater to make the place livelier for the visit of the Japanese Ambassador. That night Loesser sang his love songs directly to one of the cast, a tall, striking blonde whose name turned out to be Lynn Garland—née Mary Alice Blankenbaker, from the Middle West. She became Mrs. Loesser in October 1935.

Finally, in 1936, the lyric writer was put under contract by Universal Pictures and left for Hollywood. During this period he collaborated on several songs, such as "Junkman" and "I Wish I Were Twins," which his friend Fats Waller '42 liked and plugged. After Universal let him go, he free-lanced for a time, writing songs for *Oswald the Rabbit* cartoons and others, until he accepted a contract with Paramount. In 1937 the New Yorker did lyrics for Walter Wanger's *Vogues of 1938*, of which "Lovely One" was perhaps the most popular, and for Shirley Ross's songs in *Blossoms on Broadway*, for Paramount; according to the *International Motion Picture Almanac*, he also scored RKO's *Fight for Your Lady*, which meant he wrote one song.

The next year, Loesser teamed with Hoagy Carmichael '41 on some songs for *College Swing* and the novelty number "Small Fry" for Bing Crosby '41 in *Sing, You Sinners*, and for Bob Hope '41 and Shirley Ross in *Thanks for the Memory*, which featured their "Two Sleepy People" (Loesser did not, however, collaborate on the title song, which was taken from another picture). He also wrote lyrics that year for the Fred MacMurray-Harriet Hilliard *Cocoanut Grove*, and for incidental songs in the Joan Bennett-Randolph Scott *The Texans*, and the Henry Fonda-George Raft-Dorothy Lamour *Spawn of the North*. In United Artists' *The Hurricane*, Miss Lamour sang his "The Moon of Manakoora." "Says My Heart," from *Cocoanut Grove*, was one of his greatest successes of this period, and was for a time in the first place on *Your Hit Parade* as the most popular song of the day.

Frank Loesser and Hoagy Carmichael got together again in 1939 for *St. Louis Blues*, and the former also wrote music and lyrics for other films, including the Gene Krupa *Some Like It Hot*, and the Jack Benny '41-Dorothy Lamour *Man About Town*. By this time Loesser was "in the big money." His 1940 credits include lyrics to Jimmy McHugh's music for another Benny picture, *Buck Benny Rides Again*, and others for two Lamour opuses, *Moon Over Burma* and Twentieth-Century-Fox's *Johnny Apollo*. Around this time, too, he spent a summer working on a full-length cartoon feature at Max Fleischer's studio in Miami.

In February 1941 Paramount executives called on Loesser, who chose as his collaborator the arranger Joe Lilley, to produce one song for the Fred MacMurray-Paulette Goddard thriller, *Forest Rangers*. The result of one Sunday night's work was "Jingle, Jangle, Jingle," a simple, catchy tune which made use of the round form on the second chorus. By July it was at the top of the Nation's record, juke box, and sheet music sales, although the picture itself was not released until October. According to *Newsweek*, "the two authors could pleasantly anticipate jingling upwards of $125,000 for one hard night's work." (Later, General Elliott Roosevelt, whose Flying Fortress was named "Jingle, Jangle" and who used the song as the theme of his entire squadron, presented the lyricist with a pair of spurs which he had worn on his missions to carry out the theme. Loesser says that the song earned only some $50,000, and the promised spurs never arrived.) Concurrently, other Loesser ditties were hitting the hit parade. For *Kiss the Boys Goodbye,* to music by director Victor Schertzinger, he added five fresh and witty lyrics. One, "That's How I Got My Start," gave Mary Martin '44 the chance to do a version of the strip-tease which first brought her to public notice, and the other songs also won praise from reviewers.

Loesser's songs included several for Marlene Dietrich; singing his "The Boys in the Back Room" helped restore her box-office appeal. Others were rhythmic love songs, like "Dolores" and "Spring Will Be a Little Late This Year"; impudent novelty numbers, like "I Said No" (from the 1942 *Sweater Girl*); and still others were haunting torch songs, like "Can't Get Out of This Mood," and "I Don't Want to Walk Without You, Baby." A Loesser specialty was the "gripe song," both civilian ("I Get the Neck of the Chicken") and military ("In My Arms," from *See Here, Private Hargrove,* in which the soldier complains). Frank Loesser and McHugh wrote perhaps the first Calypso-type song for *Happy Go Lucky,* "Sing a Tropical Song." The lyric writer also tried his hand at collaborating on an original screenplay, *Priorities on Parade,* which fell with a dull thud in 1942. Perhaps his most outstanding assignment was the lyrics to Arthur Schwartz music for *Thank Your Lucky Stars,* which was not released until late 1943. Of the eight songs they wrote for performers ranging from Dinah Shore '42 to Bette Davis '41, Eddie Cantor '41 to Spike Jones, and Ann Sheridan to Hattie McDaniel '40 and Eddie (Rochester) Anderson, five became popular. The most notable was "They're Either Too Young or Too Old," the plaint of the girl back home about the shortage of men. "Love Isn't Born, It's Made" was also mentioned by reviewers, and three of more conventional type, "How Sweet You Are", "The Dreamer," and "I'm Ridin' for a Fall," as well as the title song, were heard from over the country's radios.

A month after Pearl Harbor, Loesser had been inspired by a chaplain's remark under fire to write "Praise the Lord and Pass the Ammunition," a war ballad for which the thirty-one-year-old lyricist did both words and music. Because he "didn't think the country knew what it was up against," he did not release the song until nine months later, when he felt that morale needed a boost, following this up by enlisting in the Army Air Forces. To prevent the song from being played to death, the OWI requested broadcasting stations to limit their use of it to no more than once every four hours; but by October 1942, nonetheless, more than 125,000 copies and 250,000 records of it had been sold, and its popularity continued to increase. Private Loesser, meanwhile, was applying himself so dutifully to his basic training that, according to Leonard Lyons, he did not look at a newspaper or magazine throughout that period. (Lyons adds that the writer Mark Hellinger was so shocked at Loesser's resultant ignorance that he presented him with five-year subscriptions to fourteen periodicals.) After his basic training, Loesser was assigned to write songs, which were published by regular music houses, with the profits going to Army Emergency Relief. To Army order, he turned out the official Infantry song, "What Do You Do in the Infantry?" and songs for any other branch that wanted a new one; also "The Road to Victory" and about a hundred others. Some of them, including "First Class Private Mary Brown", "One Little Wac," and "Why Do They Call a Private a Private?" were for Army revues; and, while the two first-named were plugged for their recruiting value, other show songs were kept exclusively for GI use. Loesser avoided sloganeering: "I'm a pretty good propagandist," he said, "so I don't write propaganda." Orders being orders, he turned out good rousing marches when generals insisted, but left to himself wrote the "gripe" songs, like "Classification Blues," which he was convinced were what the soldiers wanted.

From January 1944, when he was transferred to New York, Loesser headed a three-man detail, turning out parodies for the Special Services' *Hit Kits,* song sheets of which nearly three million were distributed each month. "Loesser used to like to compose from 7 to 11 in the morning while being driven around in an auto. Incredible amounts of coffee and numerous friends also went into the recipe. Now," *Newsweek* continued, "he turns it out in an Army office from 8:15 to 5:15—whether his muse is with him or not." On his own time, Loesser joined Abe Burrows in creating "Leave Us Face It," a marvelously ungrammatical love song for Ed Gardner '43 on his Duffy's Tavern program—"Leave us not blush with no shame when people bandage our name, leave us face it, we're in love." A year later, Pfc. Loesser was inspired to compose a serious and stirring ballad. "Oh, they've got no time for glory in the Infantry," was the opening line of "Rodger Young," which is both a requiem for a hero and Loesser's tribute to "the everlasting courage of the Infantry." (*Variety* reported in October 1945 that the publisher, Bob Miller, had forbidden its use by dance bands and vocalists, restricting its performances to concert artists and folk-singers.)

Since his discharge from the Army in the fall of 1945, ex-Pfc. Loesser has developed a passion for collegiate clothes. He is, to quote Naomi Jolles, "a compact little guy whom you might describe as cute, an adjective which he uses pretty generously in his own speech." She mentions that he has "a bubbling personality," "moves with bounce and regards his surroundings with sharp, gleaming eyes." His eyes are brown, as is his receding hair, and some observers credit him with dimples. Loesser is an excellent rider. In his words, he "sings like an auctioneer," except that the words make sense. "I haven't cracked a book since *Beau Geste,*" he reports, and explains that it might cramp his literary style to do so. Frank and Mrs. Loesser have one daughter, Susan. The composer's wife is an ambitious singer and actress, and as a step up the ladder has served as stand-in for Zorina '41.

MCCARTHY, FRANK June 8, 1912- Former United States Government official

Address: h. 1134½ West Ave., Richmond, Va.

One of the success stories of recent years is that of Colonel Frank McCarthy, who rose in five years from the rank of first lieutenant in the United States Field Artillery Reserve to, successively, the posts of Secretary of the War Department General Staff and, in August 1945 when he was only thirty-three, of Assistant Secretary of State in charge of Administration. The youngest man to have held such an important post in the State Department, McCarthy resigned in October 1945 because of ill health.

U.S. Army

COL. FRANK MCCARTHY

Born in Virginia, on June 8, 1912, Frank McCarthy is the son of Frank Johnson and Lillian (Binford) McCarthy. He attended the Stonewall Jackson School, the Binford Junior High School, and the John Marshall High School in his native Richmond. In 1933, at the age of twenty-one, he was graduated with a B.A. from the Virginia Military Institute and commissioned a second lieutenant in the Field Artillery Reserve. As a high-ranking cadet in his class, the winner of several medals, and the man with a reputation as "a shark on tactics," McCarthy came to the attention of General George C. Marshall['40], who, as a distinguished alumnus of V.M.I., takes a prominent part at the institute's graduation exercises each year. After his graduation McCarthy stayed at V.M.I. as an instructor (1933-35), and his acquaintance with the future Chief of Staff of the War Department developed.

For an interval in 1935-36 the young instructor worked as a reporter for the Richmond *News Leader*, then returned to the institute again to teach. A short time after this change, the future Assistant Secretary became a Broadway press agent. Two playwriting fellow alumni, Fred F. Finklehoffe and John Monks, Jr., had sold *Brother Rat*, a farce-comedy with a V.M.I. background, to producer George Abbott['40], and at their suggestion McCarthy was engaged to do special promotional work on the play by publicizing it among the alumni. It was work that had at least two attractions for McCarthy—a better salary than he had ever received, and contact with the theater, in which, it is said, he had a strong interest. When he later expressed a desire to return to V.M.I., the Abbott office, showing as keen an appreciation of his abilities as General Marshall was later to display, offered him considerably more salary than the institute had. McCarthy therefore worked as advance agent for a road company of the popular show, later for a time in the New York office on other Abbott productions. When he finally resigned in 1939, his fellow publicists declared that he could have had a successful career on Broadway, although they admit now he seemed headed for better things.

In the summer of 1939 McCarthy returned to the South to enter the postgraduate school in government at the University of Virginia, which in 1940 granted him an M.A. degree. It was in July that he was called to active duty, with the rank of a first lieutenant, and, at the suggestion of Brigadier General John Magruder, the chief of G-2 and a former V.M.I. commandant, he was assigned to the Office of the Assistant Chief of Staff, as head of the dissemination section, Military Intelligence Division. (McCarthy had retained his status as a reserve officer, drilling in a New York City armory while working for Abbott.) In April of 1941 he was advanced to captain, and that June made liaison officer between the White House and the General Staff, assistant secretary to the General Staff, and military secretary to Marshall. His appointment to major came in February 1942, to lieutenant colonel in December. A year later he was made a full colonel, and in January 1944 appointed secretary to the General Staff. This promotion, coming when he was only thirty-two, made him not only the youngest man but the first reserve officer to reach such a high post.

"In the position," reports the New York *Times*, "Colonel McCarthy had a brilliant record in manifold duties which included the processing of problems requiring the action or concurrence of the President, the Secretary of War, the Chief of Staff, and other officials. Other duties that were under Colonel McCarthy's direction were the maintenance of an office of temporary record and recording, authentication and distribution of the decisions of the Chief of Staff, supervision of the War Department's confidential classified communications, collection of statistical information of military importance sought by the Secretary of War, the Chief of Staff, and Deputy Chief of Staff." In addition to these duties, during the whole time he retained his liaison post.

The citation accompanying the Distinguished Service Medal which was presented to McCarthy at a ceremony in General Marshall's office (August 1945) states that he had made a material contribution to the successful direction of the United States armed forces during his secretaryship (from January 15, 1944 to August 22, 1945): "In the international conferences of the Chiefs of State and Staff of the United States, Great Britain, the U.S.S.R., and China, in which the strategic direction of Allied forces was accomplished, he accompanied the Chief of Staff of the Army as military secretary." The conferences to which the citation referred took place at London, Casablanca, Algiers, Cairo, Teheran, Yalta, and Potsdam. As an observer for General Marshall, McCarthy accompanied the assault forces ashore in the invasion of southern France. "His efficiency was exceptional. His devotion to duty was unusually wholehearted and unselfish," concludes the citation.

On August 21, 1945, following V-J Day, President Truman '45 announced the Colonel's appointment as Assistant Secretary of State in charge of Administration. The appointment filled the vacancy caused by the resignation of Brigadier General Julius C. Holmes '45, who had been the first person to hold the post, one of two new assistant secretaryships which President Roosevelt '42 had approved in December 1944. It had been expected that McCarthy, like his predecessor, would act as liaison man between the State and the War departments. His duties were to have included a large share of the responsibility in carrying out the expansion and reorganization programs of the State Department that were initiated by Cordell Hull '40, carried on by Edward R. Stettinius, Jr. '40, and completed by Secretary of State James F. Byrnes '41. However, McCarthy remained with the Department only until October 11, 1945, when he resigned because of illness.

Frank McCarthy is slender, five feet ten inches tall. His black hair recedes slightly from his forehead and his eyes are a blue-gray. He is boyish-looking, and some of his charm, admirers claim, is his smile and his soft Southern voice. According to one reporter, he likes tweed suits and noisy ties, and has "a nice diplomatic touch" in everything he does.

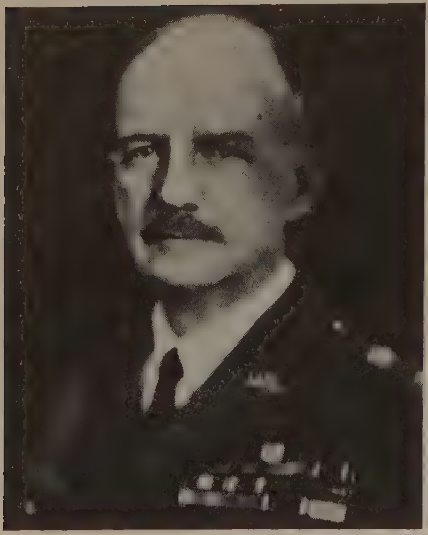
MCCOY, FRANK R(OSS) Oct. 29, 1874- United States Government official; retired Army officer

Address: b. c/o Far Eastern Advisory Com., Washington, D.C.; Foreign Policy Assn., 22 E. 38th St., New York City; h. Lewistown, Pa.

"Frank McCoy is the best soldier I ever laid eyes on," President Theodore Roosevelt once told Edwin C. Hill '40; later, McCoy was generally referred to as one of the Army's leading diplomats. Of his forty-five years in the service, nearly a quarter-century was spent on diplomatic or quasi-diplomatic assignments which took him from the Western Hemisphere to the Far East, from supervising an election in Nicaragua to investigating Japanese aggression in Manchuria. After his retirement in November 1938 Major General McCoy became president of the Foreign Policy Association, served on various boards, and was appointed in October 1945 to represent the United States on the Far Eastern Commission on Japan.

Born in Lewistown, Pennsylvania, on October 29, 1874, of Ulsterite or Northern Irish descent, Frank Ross McCoy is the son of a soldier-lawyer father, Thomas Franklin McCoy, who rose to the rank of brigadier general in the Civil War. Frank's mother was the former Margaret Eleanor Ross. One of four children, Frank attended the Lewistown Academy and then Braden's Academy, where many officers' sons are prepared for West Point. He was appointed to the Military Academy in 1893, graduated in June 1897, and commissioned a second lieutenant of Cavalry. "As a West Point man," the General has written, "I have found Latin Americans who were fellow graduates, more than once the key to stiff situations encountered in Nicaragua and elsewhere."

When the Spanish-American War broke out in April 1898 the twenty-three-year-old lieutenant was transferred to the Tenth Cavalry, a Negro regiment, and took part in the Santiago de Cuba campaign. He won the Silver Star citation for gallantry in action at Guasimas on June 24, and won it again on July 1 at Santiago, where he was wounded in the charge up San Juan Hill. April 1899 found McCoy back in Cuba with his regiment, and in May 1900 the young officer was detailed as aide-de-camp to Major General Leonard Wood, the military governor of Cuba. In Wood's administration, which historians agree "stands as a model of fine trusteeship," Frank McCoy supervised the island finances. The Cuban Government was turned over to its new President in May 1902, and McCoy accompanied General Wood on his subsequent trip to Europe to witness the German Army maneuvers. On their way to the Philippines afterward, the Americans inspected the military establishments of other European and Asiatic countries, and their ways of administering their colonies. In England the American lieutenant broke precedent by becoming a friend



U.S. Army Signal Corps

MAJ. GEN. FRANK R. MCCOY

of Field Marshal Lord Roberts, in spite of the great difference in rank.

About a year before the United States took over the Panama Canal Zone, President Theodore Roosevelt sent Frank McCoy on a secret mission to investigate several other proposed routes for the canal, on which he reported unfavorably. For three years the Pennsylvanian served as General Wood's aide in the Philippines, fighting against the hostile Moros and outlaws. In 1905 he led the Datú Ali expedition, which is said to be one of the classic exploits of American Army history: The tribal chief and his twenty thousand guerrillas had defied the American Army for two years, eluding pursuit in the swamps. Accompanied by a few men, McCoy surprised Ali, thus finally running him to earth. When not engaged in subduing the fierce Moros, McCoy held various offices in the civil government, serving as secretary of Moro Province in 1905, and province engineer in 1905-6.

Returning to the United States, McCoy was chosen military aide to the President. Later that year, when the Cuban President, Tomás Estrada Palma, asked Roosevelt's help in putting down an armed rebellion, the officer was sent back to Cuba as a member of the Peace Commission. As aide-de-camp to the Secretary of War, William Howard Taft, he arrived in Havana in September 1906 and served there for about a month while Taft was provisional governor of Cuba. Next McCoy commanded a cavalry troop in California before entering the Army War College. Graduated in 1910, he was placed on the initial General Staff Corps eligibility list and, after a period in New Mexico as a squadron commander, was detailed to the General Staff Corps in 1911. After four years on the General Staff, McCoy rejoined the Third Cavalry on the Mexican border, where he was charged with keeping order along five hundred miles of the Rio Grande, which Mexican bandits had been crossing to raid American territory. McCoy had successful engagements with them at Cavazas Crossings and Ojo de Agua. Besides human enemies, the Captain had to cope with the river, "a rebel stream that has the habit of changing its course and upsetting notions of where sovereignty abides," and he says that he once arrested an entire Mexican village and kept the villagers in his camp to save their lives. Later, in February 1917, the cavalryman was ordered to the American Embassy in Mexico City as military attaché, and in March he was promoted to major.

In June 1917 Major McCoy joined the American Expeditionary Forces in France, and served as General Staff secretary while Pershing's forces were being organized. (His *Principles of Military Training* came out in 1918.) In May 1918 he was assigned, with the temporary rank of colonel, to command the 165th Infantry Regiment of the Forty-second Division—better known as New York's Fighting Sixty-ninth, of the Rainbow Division. (Colonel Douglas MacArthur '41 was division chief of staff; McCoy said of him later, "He thinks of himself as a man of destiny, one of the few men I know who does. He is a man of destiny.") Colonel McCoy commanded his regiment in the Baccarat sector, in the Champagne-Marne defensive, and the Aisne-Marne offensive. In August 1918 he was appointed a temporary brigadier general, in charge of the Sixty-third Infantry Brigade, Thirty-second Division, which he commanded in the Oise-Aisne and Meuse-Argonne offensives. The General was awarded the Distinguished Service Medal for his staff work and his prominent part in what the citation terms "the difficult fighting east of Rheims." He has also been awarded a number of foreign decorations.

After the Armistice General McCoy commanded his brigade on its march into Germany, and was then ordered to Tours (France) in November 1918 as director of the Army Transport Service. Later he became director-general of transportation. When General James G. Harbord '45, the former AEF chief of staff, was named head of the American Military Mission to Armenia in August 1919, he chose McCoy to assist him in that investigating body. Harbord has been quoted as praising the younger general's "unvarying efficiency."

After twenty-eight months overseas McCoy was given a field command in Arizona and then two staff posts in Illinois. After reverting to his permanent rank of major, he was promoted to colonel. In 1921 "The McCoy" was again associated with Leonard Wood, as chief of staff of the Wood-Forbes special mission of investigation to the Philippines, and reportedly participated in the series of "heart-to-heart talks" which his chief had with Major General Baron Tanaka and other Japanese militarists on their way back through Tokyo. "The friendly understanding arrived at between the military leaders of America and Japan by the frank round table discussion of their irreducible minimum for peace" was said by the *Far Eastern Review* of July 1929 to have "cleared the surcharged atmosphere and made possible Japan's attendance at the Washington Conference and her acceptance of the American program for naval disarmament and the supplementary agreements concerning China." The great earthquake in Japan in September 1923 found McCoy in Shanghai, en route to Manila, but he returned to Japan to assume command of the American Relief Mission. To quote the *Far Eastern Review* again, "We know of no situation in the history of our Far Eastern relations which required such delicate handling as the one which sent the American Fleet and Army transports hurrying to Tokyo Bay laden with relief supplies. . . .His [McCoy's] splendid handling of this delicate mission . . . broke down and swept away all the remaining barriers between Japan and the United States."

McCoy returned to his duties in the Philippines as aide to Governor-General Wood. He and the future President, Manuel Quezón '41, were on terms of personal friendship. In January 1924 the forty-nine-year-old brigadier general (promoted in December 1922) was married to Mrs. Wood's niece, Frances Field Judson, whose grandfather had laid the first Atlantic cable. Ordered back to the United States in 1925, McCoy was assigned to duty in the Bureau of Insular Affairs. A course at the Infantry School (Georgia) in early 1926 was followed by command of an infantry brigade in Texas until March 1927. Similarly, after a short course at the Field Artillery School in Oklahoma, he was put in charge of a field artillery brigade in Maryland. But McCoy was soon back on diplomatic duty, as President Coolidge nominated him in August 1927 to supervise the Nicaraguan elections that November. (A condition of the armistice between the two warring Nicaraguan parties had been that the United States should guarantee the election which was to decide between them.) McCoy had under his command some five hundred of the seven thousand American marines distributed throughout the country to prevent riots and intimidation, and twenty airplanes flying over and communicating with the voting booths on election day and the day following, to prevent tampering with the ballots. McCoy was awarded an Oak Leaf Cluster to his D.S.M. for his "outstanding achievement in the face of seemingly insurmountable obstacles," and the fairness of the election was praised by the losing Conservatives as well as the winning Liberals.

In July 1928 the soldier-diplomat was appointed to represent the United States at the Pan American Conference in Washington, which was working out treaties for arbitration and conciliation. The deliberations were interrupted in December by an armed conflict between Bolivia and Paraguay over the much-disputed Gran Chaco boundary, and McCoy was selected as head of the seven-nation investigating commission. (Their efforts did not, however, avert the war, which broke out in 1933.) After two years and five months in command of the Fourth Corps Area at Atlanta, in February 1932 Major General McCoy was assigned by President Hoover '43 to the League of Nations commission of inquiry into the Manchurian situation, headed by the Earl of Lytton; his fellow commissioners were an Italian count, a German doctor, and a French general. The Lytton Commission's report, issued in October 1932, stated that "it is a fact that without a declaration of war a large area of what was indisputably the Chinese territory has been forcibly seized and occupied by the armed forces of Japan, and has in consequence of this operation been separated from and declared independent of the rest of China." General McCoy's services on this delicate mission are officially described as "of the highest order."

Assigned to command the First Cavalry Division in Texas in March 1933, McCoy was ordered to Omaha in October to assume command of the Seventh Corps Area. In February 1935 he took over the Second Army and the Sixth Corps Area in Chicago, thus becoming one of the four most potent commanders in the country, after Chief of Staff MacArthur—*Fortune* called them "the four big shots with the three Irish names," meaning Major Generals Nolan, McCoy, Hagood, and Malone, commanding the four armies. (McCoy's chief of staff in Chicago was Colonel George C. Marshall '40.) As his last assignment before retiring, in May 1936 McCoy succeeded Nolan as commanding general at Governors Island (New York), which the *Literary Digest* called, "the Army's prize plum. . . .General McCoy might have climbed even higher," the magazine added, "to the four-starred shoulder straps of General and Chief of Staff, but he was in Scotland shooting grouse when the Army's top-notch billet was vacated. It was typical of him not to be in Washington, D.C., when commands were being shifted. He doesn't play military politics, or go out of his way to seek promotion."

For several years General McCoy headed a research group, in cooperation with Harold J. Tobin and Percy W. Bidwell; their findings, completed before the outbreak of the Second World War, were published as *Mobilizing Civilian America* (1940), with an introduction by McCoy.

On November 1, 1938, the sixty-four-year-old general went on the retired list, and the next February the board of directors of the Foreign Policy Association, a nonprofit and nonpartisan research and educational organization, elected him president. He was also elected to various other boards of directors or trustees, including the Equitable Life Assurance Society and a number of internationally and socially minded bodies.

The officer was selected in December 1941, with Justice Owen J. Roberts '41 and three colleagues, to investigate responsibility for the Pearl Harbor disaster. (Earlier, in 1931, he and three others toured Latin America in behalf of the Inter-American Escadrille, a membership organization.) In July 1942 President Franklin D. Roosevelt appointed McCoy to head the military commission of seven generals for the trial of eight Nazi spies and saboteurs who had been landed on the Atlantic Coast from German submarines.

He was called on again, in October 1945, when Secretary James Byrnes '41 announced the General's appointment to represent the United States on a projected Far Eastern advisory commission. This body was to report and make recommendations to the members' respective governments on carrying out the terms of the Japanese surrender.

Until the meeting of the Big Three foreign ministers in Moscow that December, the Russians refused to accept the commission, urging instead a division of authority in the control of Japan and the substitution of an Allied control council. As a result of the conference it

MCCOY, FRANK R.—*Continued*

was decided to revise the body, and Russia agreed to appoint a representative. Before the revision took place, however, the group, representing the United States, New Zealand, Britain, the U.S.S.R., the Netherlands, China, France, Canada, the Philippines, Australia, and India, left for Japan on December 26 to study the American administration of the country. Emphasizing that it hoped to become more of a policy-making body, the commission dropped the word "Advisory" from its original name of Far Eastern Advisory Commission. McCoy was unanimously chosen by the other delegates for chairman.

The mustached general from Pennsylvania, square-jawed and blue-eyed, is of average height and wiry build. He is said always to keep himself in the pink of condition, to be fond of shooting, a pretty good deep-sea fisherman, and able to "ride anything that has a saddle on it"; a friend says that he will take one drink during a social evening, but no more. McCoy's career has brought him many honors, including six honorary LL.D.'s and eight foreign decorations; he has returned one of them, the Japanese Order of the Rising Sun. He is a Presbyterian and belongs to two clubs in New York, one in Philadelphia, and three in Washington, and is president of the Philippine Club, a group of old-timers who meet to talk over island days.

MCCRACKEN, JOAN Dec. 31, 1922- Dancer; actress

Address: b. c/o Willard Keefe, 1545 Broadway, New York City; Warner Brothers Pictures, Inc., 321 W. 44th St., New York City

"Overnight successes" are fairly common in the New York theater; but on examination it usually turns out that the so-called "discovery" has been around for seasons without attracting any particular attention. An exception is bubbling Joan McCracken, an obscure ballet dancer who in 1943, on her first appearance in any play, stepped out of the *Oklahoma!* ballet line long enough to fall down, as required, and thereby win applause, publicity, a movie contract, and in 1944 a comedienne role in *Bloomer Girl.*

Joan McCracken was born December 31, 1922, in Philadelphia, where she attended grade and high schools. Her father, Frank McCracken, was a reporter who wrote sports news for the Philadelphia *Public Ledger.* For Joan's eighth birthday an aunt gave her tuition for dancing lessons. At first it was acrobatic dancing, but Joan ran into "trouble with flip-flops," and even her mother's offer of a dollar per flip-flop failed to inspire her. So Mrs. McCracken transferred Joan to the Catherine Littlefield Ballet School, and was unmoved by her daughter's protests that all the other students were much better than she. According to the Warner '45 Brothers publicity office, Miss McCracken's own desire was to be an actress, and she was active in school dramatics, but she did well enough at ballet to attract the attention of Miss Littlefield's sister Dorothie, the noted dancer. In 1934 Dorothie Littlefield brought Joan, then twelve, to New York as one of an initial group of scholarship students at the School of American Ballet. There Joan studied under Miss Littlefield, George Balanchine '42, Muriel Steuart, and Pierre Vladimirovitch for several years. Her first public appearance was made with the American Ballet in the 1934-35 season.

When Joan was sixteen her father died, and her mother began to write the Pennsylvania Military Academy's publicity in return for young Frank's tuition. Joan, who had been studying dancing at the Littlefield School, left the West Philadelphia High School to join Catherine Littlefield's Philadelphia Ballet. Her first appearance with this group was at the Philadelphia Academy of Music; she then accompanied them on extensive tours, which reached England and the Continent, France and Belgium in particular. Catherine Littlefield, the choregrapher whose company was later called the Littlefield Ballet, sought to have a young and thoroughly American sort of ballet, and her company has the distinction of never having danced *Swan Lake.* "When we did the classics," she says, "we did something that was not commonly done—the full-length *Sleeping Beauty, Daphnis et Chloé.* We started the Americana in divertissements. Then when I took the company abroad in 1937 I realized that what they would want to see there was not European but American ballet. That's how *Barn Dance, Terminal,* and later *Cafe Society* and *Ladies' Better Dresses* originated. The idea was: American themes, American composers, and American kids." And European audiences are said to have loved it.

After returning to the United States, Miss McCracken went back to the School of American Ballet (she earned some money as a model). In August 1941 the twenty-year-old brunette was engaged by the Radio City Music Hall Corps de Ballet to dance several times daily in the lavish stage show accompanying the motion picture presentations. Miss McCracken left the security and obscurity of this job in January 1942, after five months, to join Eugene Loring's Dance Players. This group of a dozen young dancers, with Janet Reed as the feminine star, made its New York debut in April 1942 and later toured the country with a repertoire of eight ballets, alternating roles. Joan McCracken's best part was as the Mexican sweetheart in Loring's *Billy the Kid,* which the *New Republic* calls "the most native and wonderful story ever danced." She was given the star role in Loring's new *Duke of Sacramento,* but this ballet never reached New York, which is to say that for all practical purposes it never really existed. After a year the Loring company broke up because of the difficulties of wartime touring.

Around this time, Agnes de Mille '43 was looking for dancers for *Away We Go,* a musical version of Riggs's *Green Grow the Lilacs* which the Theatre Guild was producing. For her ballets the choregrapher wanted performers who were not only "dancers to their finger-tips" but actors as well, and "boys and girls you would remember . . . as friends you'd like to see again some time." Joan McCracken was chosen as one of them, to dance in four scenes. Although listed on the cast sheet as Sylvie, she had no real part in the dramatic portions, but Miss de Mille chose her to dance an awkward country girl who wobbled out of line and fell down, displaying her turn-of-the-century boots and drawers. She also had a real solo later, "all leaps and fillips," as one of two picturesquely dressed cancan girls.

On March 31, 1943, when the play opened in New York as *Oklahoma!* it immediately became a hit. The main attractions were, of course, the Rodgers '40-Hammerstein '44 score, the de Mille choregraphy, and the singing and acting of Alfred Drake '44, Celeste Holm '44, and Joan Roberts. But the surprise of the package was Joan McCracken, the "pixie ballerina," for despite the microscopic size of her part she "established herself on Broadway as an enchanting new talent with a flair for puckish comedy," attracting more attention than the ballet leads Katharine Sergava and Marc Platt combined. *Look* Magazine listed her as one of four "girls who have squirmed out of obscurity and are causing the paying customers to stamp their feet and callous their palms," and pointed out that at twenty-one she was younger than any of the others (Betty Garrett, Vera-Ellen, and Sono Osato '45). *Vogue* published her picture; *Life* gave "the girl who falls down" three pages; Chesterfield cigarettes spread her endorsement over the countryside; interviews became frequent; the Duke of Windsor '44, missing her when he saw *Oklahoma!* for a second time, came backstage to make inquiries. (She was suffering from jaundice.) And all the time Joan McCracken had so little to do onstage that many a far-off balcony patron left the theater without having decided which dancer was that McCracken girl he'd heard so much about.

Miss McCracken says she never daydreamed of an acting career. While appearing in *Oklahoma!* however, she "tried a few afternoons of it," appearing before invited audiences at the Neighborhood Playhouse in Tennessse Williams' *The Lady of the Larkspur Lotion.* The role she played had been written for Lillian Gish '44. "I loved playing the part, though," Miss McCracken is quoted. "It sort of gave me power I didn't realize I had before."

In April 1944 Warner Brothers picked Miss McCracken out of the *Oklahoma!* cast and sent her to Hollywood. There she worked on her singing, dancing, and acting, and spent seven weeks rehearsing and one week shooting a *Ballet in Jive* for *Hollywood Canteen.* This was one of the longer numbers in that "star-studded jumble," running a full five minutes on the screen, and was mentioned as a high spot by many reviewers. *Variety,* the bible of show business, wrote that the dancer "lenses excellently" and "terps for boff results." Director Lewis Milestone wanted her to play the model in the Hunt Stromberg production of *Guest in the House,* the part which finally went to Marie McDonald; but Miss McCracken got permission to return to New York for a featured role in another period musical, *Bloomer Girl.*

JOAN MCCRACKEN

Bloomer Girl, which began its New York run in October 1944, had Celeste Holm and David Brooks in the leads and Joan McCracken as a singing and dancing comedienne. For her vocal numbers, a semi-strip to "T'morra, T'morra" and a play-within-a-play scene as Topsy, she sang in a raucous comedic voice which later proved useful in hailing cabs, although she was then studying with a voice teacher. Comments on it varied from "she handles her numbers beautifully," to "Miss McCracken is an excellent dancing comedienne who should not try to sing." In general, reviewers praised her "effervescent charm and humor." However, the New York *World-Telegram*'s intransigent Burton Rascoe complained that "Miss McCracken is cute, but last night she was so busy being cute that (to me) she was irritating." One scrivener added a wistful note: "It is a pity that Joan McCracken is kept so busy as a principal comedian that she has little time to dance, for she is a top-notch dancer." As the souvenir program remarked rather smugly, "Her emergence here as a singing and dancing comedienne has forced a violent shift of plans for her once she is back before the cameras. The studio didn't know her strength." She was given *The Billboard* Donaldson Award for the best feminine supporting performance in *Bloomer Girl.*

Miss McCracken left *Bloomer Girl* in September 1945. Three months later she opened in the title role ~~of~~ *Billion Dollar Baby,* sharing the spotlight with Mitzi Green. The authors of the musical comedy, Betty Comden '45 and Adolph Green '45, had conceived the idea of satirizing the "Terrific Twenties." The critics' reaction was that for the most part the two had fallen short of a good idea, while the part they had written for their heroine, "a feather-brained gold digger," was considered inconsistent. Reviewers wrote that Miss

MCCRACKEN, JOAN—*Continued*

McCracken disposed of this matter with "bouncing aplomb," that she was "beguiling," and "amiable," but that on the whole they were unable to unscramble the uncertainties of the character she was supposed to be.

Not long after *Bloomer Girl* opened, she proved her right to the term "trouper" by going on with her performance and a scheduled interview after receiving word of the death of Frank, her only brother, in the Pacific. That interviewer found the pert brunette and her mother living in an unpretentious little apartment full of Joan's paintings, which were described as striking primitives executed on barrel tops and crate ends, and showing a gift for likenesses. Miss McCracken's husband, Jack Dunphy, formerly of the *Oklahoma!* ballet, was an Army private on maneuvers at the time. (Warner Brothers report, incidentally, that when Joan and Mrs. McCracken were unable to get a painter for their Hollywood apartment, they painted the walls themselves.) The interviewer saw in Miss McCracken "everybody's older sister . . . the girl you never had to worry about because you never knew if she was sick or unhappy or had problems of her own . . . always sympathetic and always good for a laugh," and suggested that that quality communicated itself to an audience and was the basis for her popularity: "She has her audience in the palm of her hand every second."

Like most ballerinas, pretty Joan McCracken is a convenient size for a partner to lift: five feet one and one-half inches tall, she weighs one hundred and seven pounds. Her favorite color is red, which sets off her dark brown hair (naturally straight), gray eyes, and pert, childlike face. Besides painting, she collects antique furniture, writes, likes Russian and Irish literature, loves to ski, and is studying music seriously. Miss McCracken claims to be a contralto; but her teacher, a tenor with a preference for the higher registers, insists that she is a mezzo-soprano.

MCCREERY, SIR RICHARD L(OUDON) Feb. 1, 1898- British Army officer
Address: b. c/o War Office, London

The unconditional surrender of the German armies in Italy on May 2, 1945, brought to an end one of the hardest-fought campaigns of the Second World War. The British Eighth Army, under Lieutenant General Sir Richard L. McCreery, shares with the American Fifth Army of General Clark '42 and Truscott '45 the glory and the losses of the battle for Italy. Their campaign is described by the Allied Supreme Commander in the Mediterranean, Field Marshal Sir Harold R. L. G. Alexander '42, as one "which will long live in history as one of the greatest and most successful ever waged." A few months after V-E Day McCreery became commanding officer of the British Forces of Occupation in Austria.

Richard Loudon McCreery was born on February 1, 1898, the son of Walter A. and Emilia (McAdam) McCreery of Bilton Park, Rugby. After studying at Eton, he attended the Royal Military College at Sandhurst. At seventeen young McCreery joined the Twelfth Lancers, in August 1915, as a second lieutenant. He served with them in France until 1917, was wounded, and returned as a full lieutenant to fight from August to November 1918, when he won the Military Cross. His regiment was one of the first to be mechanized, and he "accepted the armored fighting vehicle without reserve."

Between wars McCreery spent most of his time on regimental duties, with time out for steeplechasing—he won the Grand Military Gold Cup at Sandown Park in 1923 and again in 1928. In 1921 he was chosen adjutant of the regiment, and was promoted to captain in 1923 and to major in 1927. He was married in 1928, to Lettice, daughter of Lord Percy St. Maur. In that year, too, the thirty-year-old Major entered the Staff College. In 1930 he was made brigade major of the Second Cavalry Brigade in the Southern Command, covering a number of regiments, and remained in this post until 1933. Two years later McCreery was raised to lieutenant colonel and given command of his old regiment, the Twelfth Lancers, which had become an armored car unit in 1928. In 1937 he was made a brevet colonel, and in July of that year was made a full colonel.

In 1938 Colonel McCreery was made General Staff Officer 1 of the First Division; his work in the desperate Dunkerque campaign of June 1940 won him the Distinguished Service Order and his promotion to brigadier in July (having first been made acting brigadier and then temporary brigadier). That December he was again promoted, to acting major general, and was given command of an armored division. General McCreery's work was mentioned in dispatches in 1941; he was "one of the young progressive generals to whom were entrusted the formation and training of the new armored divisions and the armored groups which came into existence in 1941." In the spring of 1942 he was in the Middle East as adviser on armored fighting vehicles at the General Headquarters. That summer General Sir Harold Alexander replaced Sir Claude Auchinleck '42 in command of operations, and General Sir Bernard L. Montgomery '42 was placed in command of the Eighth Army, after its loss of Tobruk. McCreery became Alexander's Chief of the General Staff. In this capacity he worked on the British counteroffensive which began on October 23, 1942, and was culminated at El Alamein; and he helped plan the North African landings in November 1942, the first large-scale amphibious operations the Allies had undertaken.

Like many armies, this "British" Eighth was made up of troops from various parts of the world, speaking various languages. In addition to the Englishmen, Irish, Scots, and Welshmen from the United Kingdom, it included New Zealanders, under Lieutenant General Sir Bernard C. Freyberg '40, and divisions from India, South Africa, and Australia, as well as Fighting French and Greek members of the Southern Division. Visiting the Eighth in Tripoli, Prime Minister Winston Churchill '42 declared, "I have never in my life . . . seen troops who march with the style and air of the Desert Army. Talk about spit-and-polish—!" At the end of the Italian campaign, when the Allied forces in Italy included Canadian, Polish, and Brazilian units and the Jewish Brigade, Churchill was to term it "as gallant an army as has ever marched."

For his staff work in Tunisia and the Middle East General McCreery was made a Companion of the Bath, and later a Knight Commander of the same Order. (He had already received the decoration of the Order of the British Empire.) In 1943 his major generalcy was substantiated (made permanent); and late that August he was given a field command—the Tenth Corps, attached to General Mark W. Clark's American Fifth Army. This was just before the Allied invasion of Italy. In the battle for Salerno, McCreery's corps was so hard-pressed that at one time the Germans thought the Wehrmacht had won and announced its victory. But the British and Americans clung to their beachheads and battled their way inland. Later Sir Richard and his men "played a decisive part in developing a brilliant technique for the passage of swift mountain rivers in the face of violent opposition," to quote a British release, and in "employing armor with a decisive effect in what had previously been thought impossible ground and weather conditions."

The Allied forces liberated Naples on October 1, 1943, but their way to Rome was hampered by mountainous terrain and unfavorable weather conditions. While the British Eighth Army fought its way along the so-called "Hitler '42 Line" of German defenses, the American Fifth and General McCreery's corps inched along toward the north. Rome was taken on June 4, 1944, and in July Alexander announced, "The Allied armies in Italy have driven a battered enemy a hundred and fifty miles to the north of Rome within one month in a campaign that must rank with the most vigorous and carefully planned campaigns in modern blitz warfare." With the fall of Florence in August 1944 the battle of central Italy was over, and the battle of northern Italy began.

In contrast to the movements of the Allies on the Western front, which began with the landings in Normandy in June 1944, the grim Italian fighting was slow and dull to the newspaper readers: *Time* aptly called it "the forgotten front." That November McCreery took over command of the Eighth when General Sir Oliver Leese '44 was transferred to India to head a new army group. Over the mountains and through the mud and rain his army pushed along the Rimini-Bologna highway. In December 1944 his Britishers and Canadians freed the Adriatic coastal city of Ravenna, putting McCreery in position to strike toward the flank and rear of the Bologna defenses; and the same month Faenza fell to the Eighth also. Then, on April 21, 1945, the Eighth and the American Fifth Army surged into Bologna from virtually all directions and gained the greatest victory in the Italian campaign since Rome was taken. The long and bitter battle of the Apennines had come to an end with the fall of the most important communications hub in the Po Plain. With unabated speed the Allied armies pressed on toward the Brenner Pass, the Fifth capturing the important cities of Verona and Parma. The Italian Partisans rose in Milan and Turin and drove out the Germans, while McCreery's army took Venice.

British Official Photo.

LT. GEN. SIR RICHARD L. MCCREERY

On May 2, 1945, almost two years after the Allies made their first landing on the Italian mainland, the German armies in Italy surrendered unconditionally. The collapse was anticlimactic. The Fifth Army had already smashed to within thirty-five miles of the Austrian border for a junction with the American Seventh Army driving into the Austrian Alps under General Alexander M. Patch '43, and it was reported in Rome dispatches that the British Eighth Army had joined with Tito's '43 Yugoslav forces in a drive to crush the German troops still fighting in Yugoslavia. General Clark's statement, "The military power of Germany in Italy has . . . ceased, even though scattered fighting may continue," officially closed the Italian campaign. Sir Richard McCreery and his Eighth Army then went to work on Austria.

But McCreery's work in Italy was not finished. He sent his New Zealand Second Division two hundred and twenty-one miles in twenty-three days to cross the Isonzo River and seize the Istrian peninsula, to which Tito had laid claim. On the afternoon of May 2, 1945, General Freyberg accepted the surrender of the German garrison of Trieste to the Allied forces. The troops, which occupied the cities of Trieste and Gorizia, brought Allied Military Government units along, as usual, but they found that the Yugoslavs had already taken over the military government of the disputed area. There was, however (according to Milton Bracker of the New York *Times* staff), "on strictly military grounds not the slightest evidence of friction between the Yugoslavs, who now are administering the Adriatic city [Trieste], and Eighth Army New Zealanders," in ten days. (Since early April, inci-

MCCREERY, SIR RICHARD L.—*Cont.*

dentally, it was announced that General McCreery's old regiment, the Twelfth Royal Lancers, had "cooperated continuously" with the New Zealand division.) The three cities of Trieste, Gorizia, and Fiume were a long-standing sore point between Italy and the Slavs, having passed from hand to hand for hundreds of years, but by mid-May 1945 the dispute seemed to be on its way to a settlement. In July the famous Eighth was disbanded, and McCreery was appointed commander of the British Forces of Occupation in Austria. It was a difficult assignment, for Austria was faced with scarcities of fuel, food, clothing, and other necessities, and with an uncertain political future.

Sir Richard McCreery, K.C.B., K.B.E., D.S.O., M.C., is a thin, light-haired man. Devoted to armored vehicles in the field, he has an equal fondness for horses: his favorite recreations are polo, hunting, and steeplechasing. He is also a member of the Marylebone Cricket Club. Sir Richard and Lady McCreery have four sons and one daughter.

Who's Who, 1945

MACGOWAN, GAULT Feb. 7, 1894- Journalist

Address: b. c/o New York Sun, 280 Broadway, New York City

A veteran war correspondent who has lived and traveled in many parts of the world, British-born Gault MacGowan has crammed more dangerous adventures into his lifetime than most men would care to experience. To top them all, he was captured by the Germans on August 14, 1944, while with the American forces in northern France. After two weeks as a prisoner MacGowan escaped "through a series of adventures that would make a Hollywood scenarist bite his nails with envy," joined the French Maquis in a forest near Champagne, and eventually returned to the United States after five years of covering the war fronts. At the end of 1945 he was director of the European News Service for the New York *Sun*.

Gault MacGowan was born in Manchester, England, February 7, 1894, the son of Robert Alexander Ernest and Marie (Hilton) MacGowan. He is the descendant of a long line of Ulster Irish forebears who have been transatlantic commuters since the time of sailing ships. The Gault name is Huguenot and is a family name associated with the well known Gault family of Montreal. MacGowan's grandfather was for many years a doctor near Bellefontaine, Ohio. "My grandmother was Elizabeth Gault, who fostered in me great respect for and appreciation of the New England literary tradition," the correspondent says.

Young MacGowan went to the Manchester Grammar School and to Manchester University; then to the Sorbonne for graduate work. That was in 1914; when war broke out he immediately enlisted. He was assigned to an Indian cavalry regiment, the Lancers, rose to the rank of captain, served in France, Italy, and Mesopotamia, and was wounded several times. On returning to India with his regiment in 1922 he became a correspondent for the Associated Press, covering the disturbances on the northwest frontier in India for a year. In 1923 he was married to Wendy Smith, daughter of Mr. and Mrs. J. H. Corley Smith of Simla, India. The couple have one son, Barry Alaric Gault, born in Iraq in 1925.

Having decided on newspaper work for his future career, MacGowan in 1924 accepted an offer to become editor of the Mesopotamian *Times*, which had been started after the war for the officers and men stationed in that country. Then, in order to gain necessary experience on a large paper, he returned to London to read copy for the London *Times*. In 1926-27 he was a staff correspondent for the Paris *Daily Express*, and two years later he left to become assistant editor and editorial writer for the Cardiff *Evening Express*. For a year he also wrote a column, *Londoner's Diary*, for a British syndicate.

Attracted to the West Indies, in 1929 MacGowan became managing editor of the Trinidad *Guardian*, and until 1934 made his influence felt throughout the West Indies. He represented those colonies at the Imperial Press Conference in 1930, and from 1930 to 1935 was the honorary secretary for the West Indies on the council of the Institute of Journalists. He was also the correspondent at Trinidad for the London *Times*, the New York *Times*, and other American and European newspapers.

In addition to journalistic recognition, MacGowan at various times since the war had won attention by his travels and adventures. He explored the wilds of northern India. He discovered a new pass through the Himalayas into Little Tibet which was named for him. He made aerial expeditions, too—the first flight over Orinoco Delta and across Venezuelan llanos, between Trinidad and Maracay; and the first flight between Trinidad and British Guiana.

Two articles (later reprinted in pamphlet form) resulted from these travels: "To the End of the World and Beyond," and "My Desert Dash to Damascus." The first told of his discovery of the new pass into India: "'The end of the world' was a real place in Hindu mythology, but I proved it wasn't—though there is no known road into Tibet beyond the mighty cliff and shrine which gave it its name." The Damascus trip was made via motorcar across the desert from Kurdistan and Mosul to Syria, the first trip of its kind. "The desert was wild, lawless, and untamed," the explorer related. "Holdups were frequent, and an officer who tried it after me was stripped of everything and had to walk naked into the Lebanons!" MacGowan plans to incorporate these two accounts into, he says, "the adventure book I plan to write when I stop having adventures."

During his years as a "provincial" journalist, and adventurer, Gault MacGowan received honors from several foreign governments. Among these were Officier de l'Instruction Publique (1930), Officer of the Portugal Military Order of Christ (1933), and Chevalier de la Légion d'Honneur (1934). He has also been a Selfridge prizeman, a member of the Company of Newspaper Makers, a Liveryman of the Stationer's Company, a Freeman of the City of London since 1937, and a Fellow of the Royal Geographical Society of London. (He was obliged to resign from the latter because of the time taken up by his newspaper work.)

It was in October 1934 that MacGowan joined the staff of the New York *Sun*. For that paper he covered the coronation of King George VI '42. He was on vacation abroad when the Spanish Civil War broke out, and was sent by the *Sun* to Spain. Among his articles at this time were "The Scarlet Pimpernels of Spain" and "Red Vultures of the Pyrenees," which appeared in the *Commonweal* in January and February 1938. In these two he told of some of the men and women who risked their lives to help the victims of the "Red Terror" escape to neutral lands. Condemning the Spanish Loyalists and their Left-wing sympathizers, MacGowan said that, on the fringe of the Pyrenees, "the crimson vultures of Sovietism hover for further pickings from the homes of civilization."

In the fall of 1938 MacGowan decided to visit England again, and was there when the war broke out. He represented his paper during the Battle of Britain and, early in 1941, during the Battle of the Atlantic, he began recounting his experiences aboard one of the American destroyers that had been transferred to England for convoy duty. Later he was press observer with the Commandos in the raid on Dieppe. MacGowan was particularly well qualified to cover Britain at war: as a former British Army man, he "talked the language" of the Tommies and their officers; he could well understand, also, the British civilian character and viewpoint. At the same time, from his long experience writing for an American paper, he could present what he saw in terms familiar to his American readers.

When the big news of the war shifted to North Africa, MacGowan was assigned as a correspondent to the American Army there. He was with the French on April 25, 1943, when they attacked Jabel Mansour in North Africa, where he received a leg wound. Despite the injury, MacGowan followed the attacking force through to the successful conclusion of the battle, and was awarded the Purple Heart by special order of President Roosevelt '42. For the same incident he was cited for bravery and awarded the Croix de Guerre by General Henri Giraud '42. In late 1943 he covered the action of the Royal Hellenic Navy, and reported on interviews with young seamen of Greek descent who had relatives in the United States.

In July 1944 MacGowan was with the United States forces in Normandy. To his paper he sent back stories not only of the progress of Allied troops, but of scenes following the German retreat. Some of MacGowan's own adventures were less heroic than humorous: He told how he had ridden to the front astride an old gray mare named Brünnhilde—actually a French horse who had been conscripted by the Germans. He had found her stampeding out of the German lines, pulling her cart behind her; since she had completely lost her gunshyness, MacGowan mounted her and trotted off with the advancing infantry regiment. "It was a fantastic journey," he relates. "Men were sticking their heads out of tank turrets to shout such comments as 'Hi, ho, Silver', 'Here comes Man-o'-War', 'Paul Revere,' and 'I'll trade you a tank for her,' as we ambled through the bomb-shattered countryside to survey the damage." By the end of July MacGowan was moving with General Omar Bradley's '43 forces out of the hedgerow country into the Norman highlands, following the line of German retreat along miles of smashed vehicles. On the first of August the correspondent rode in the jeep with the first American to reach the historic island of Mont Saint Michel off the northwest coast of France.

N. Y. Sun

GAULT MACGOWAN

Then, on September 1, the German radio reported that on August 15 one "Gowan," a correspondent for the New York *Sun*, had been captured. This was followed up by a cable to the *Sun* from MacGowan himself confirming the report but adding that he had managed to escape to Paris. Several days later the full story was made public. MacGowan and two British correspondents had heard a premature report of the capture of Chartres, and when they were captured near the city they were riding in a jeep ahead of the advancing American troops. After a night in a barracks with twenty American prisoners, the Captain (the rank accredited to correspondent MacGowan) was taken by two Nazi officer-correspondents on a tour of Paris night life—apparently to prove to him that Germans were not uncivilized. But it was the last night of German occupation: on the roads out of Paris the next day were "long, densely packed columns, the remnants of once proud regiments."

On his way to internment in Germany, the correspondent escaped from the train and, with clothes torn to shreds by barbed wire, made his way in the general direction of Patton's army. Guided by sympathetic French people he reached a Maquis camp, and there he witnessed the assault and capture of Châlons-sur-Marne, the hub of the German retreat from Paris. The F.F.I. had been mobilized in the woods, waiting to join up with General Patton's armored spearheads. They had excellent food, and "lived a life like Robin Hood's, not in Sherwood Forest, but in a Christmas tree land." When the Americans came the F.F.I. met them, led the way to Châlons, and took

MACGOWAN, GAULT—*Continued*

the town. On his own again, MacGowan made his way to Paris, where, on September 1, he walked into the bar of the Paris hotel which served as press headquarters. The rest of the reporters almost dropped their glasses. "For the usually immaculate MacGowan was dressed in borrowed French civilian clothes that fit him like Europe fits Hitler—too big in some places, too tight in others." He was a year later to visit concentration camps all over Germany in an effort to locate the prisoner-husband of one of the women who had supplied him with a farmer's overalls and helped him to escape.

Gault MacGowan went on to London for a few days to report the changing British scene, then sailed for New York in October 1944, for the first time in five years, looking "trim and fit in his correspondent's uniform, with a chest full of campaign ribbons and decorations from two wars." His associates decided that he deserved still another decoration, since the first act of the dauntless traveler and adventurer was to get lost in Brooklyn. He finally made his way "from the Brooklyn battlefront" to the *Sun* offices, where, for once on the other end of interviews, he recounted some of his experiences.

After his leave in the United States MacGowan returned once more to Europe. He covered the invasion with Patton's army, was in Paris for Easter 1945 and the first big military parade after the liberation, went to Berchtesgaden with the Americans and to Buchenwald with the French. He was in Potsdam for the Big Three conference in July and in London during the conference of Foreign Ministers in the autumn of 1945. At the end of December, after another brief period in America, his dispatches were again coming from the British capital. Shortly before that, MacGowan was one of a number of civilian war correspondents who received awards of campaign ribbons "for outstanding and conspicuous service with the armed forces under difficult and hazardous conditions."

The correspondent has received the warmest praise from one of his former fellow prisoners in German-occupied France. "With MacGowan there," the soldier wrote in a letter to the *Sun*, "you just couldn't help feeling good. He was always so darn cheerful and had such great stories to tell." The man also described MacGowan's prowess as a chess player: "It would take him only a few minutes to beat me; then he would try to teach me the tricks." Chess, it seems, is MacGowan's favorite indoor recreation. He plays the game, a colleague says, the way he goes for news: "All out to win and no quitting as long as a pawn is left." Other favored recreations of his are driving and horseback riding—although perhaps on something a little more elegant than the old gray mare on which he rode to the front in France.

Tall, dark-haired, with a "devil-may-care" look in his eyes, Gault MacGowan, according to his friends, seems to thrive on adventure. In appearance today he looks younger and more fit, if anything, they say, than he did when he left to cover the war in 1939. He declares that he isn't "ready for the carpet slippers yet. I have seen a lot, been through a lot, and I have enjoyed every minute of it. Adventure keeps you young. Or maybe it's because I'm just a kid at heart. Anyway, I haven't had enough of it yet."

MCINTIRE, ROSS T. Aug. 11, 1889- United States naval officer; physician

Address: b. c/o Navy Department, Washington, D.C.; h. 3637 49th St., N.W., Washington, D.C.

Surgeon General of the United States Navy and Chief of the Bureau of Medicine and Surgery since 1938, Vice-Admiral Ross T. McIntire was better known as the White House physician who for ten years had the vitally responsible job of looking after the health of the late President Franklin D. Roosevelt['42]. His administration of the Navy Medical Department during the time of the greatest expansion in its history won for him the rank of vice-admiral in 1945, the highest rank ever given a medical officer.

Born on August 11, 1889, in Salem, Oregon, Ross T. McIntire is the son of Charles Thaddeus and Ada (Thompson) McIntire. After attendance at Salem's public schools, he entered the Willamette University Medical School in 1907 (now merged with University of Oregon Medical School in Portland). He received his degree of Doctor of Medicine in 1912, and went into private practice in his native Salem. Ten years later, his country's neutrality threatened, the twenty-seven-year-old doctor joined the United States Naval Reserve in January 1917; in April he entered the Medical Corps of the regular Navy, as assistant surgeon, with the rank of lieutenant (junior grade). A course of instruction and indoctrination at the Naval Medical School, Washington, D.C., followed, and in July he was attached to the *New Orleans*. (During the war he rose to the rank of lieutenant commander, temporary.) After the war—he had decided to remain in the service—he was commissioned a regular lieutenant in July 1919. He remained with the *New Orleans*, which in the first postwar year operated in the Pacific with the Asiatic Fleet, and as a station ship at Vladivostok. Following his detachment from the *New Orleans* in January 1920, McIntire for a short time was on duty at the Naval Hospital in Canacao, Philippine Islands.

Returning to the United States, the young Navy doctor did postgraduate work at Washington University in St. Louis in 1920, and at the Washington Naval Medical School in 1921. After two years at the San Diego Naval Hospital he was assigned to the hospital ship, the *Relief*, in August 1923. His promotion to the rank of lieutenant commander came in June 1924. After detachment from the *Relief* in September 1925, he was assigned to duty at the Naval Dispensary and later at the Naval Hospital, both in Washington, D.C. In June 1929 he returned to his post on the *Relief*.

The physician's interest in the diseases of the eye and ear led him in 1929 to take further postgraduate work, this time at the University of Pennsylvania's School of Medicine. When he finished his course of studies he served for two more years on the *Relief* and then was appointed to an instructorship in ophthalmology and otolaryngology at the Naval Medical School in the Nation's Capital. At the same time he was on duty at the Naval Hospital.

In June 1934 McIntire, now a full commander, accompanied President Roosevelt on a cruise in the *Houston* to Panama and Hawaii; the following February he was appointed White House physician, at the same time continuing with his work at the Naval Hospital. With this appointment came his promotion to the temporary rank of captain, which was made permanent in July 1940. In the interim, on his appointment as Surgeon General of the Navy and Chief of the Bureau of Medicine and Surgery in December 1938, McIntire was given the temporary rank of rear admiral. This promotion raised him above one hundred and eighteen senior officers in the Medical Corps. (A precedent in jumping rank was established by Woodrow Wilson when he appointed Captain Cary T. Grayson as his personal physician. Roosevelt, in choosing an officer for his own doctor, had followed another long-established custom; Presidents Hoover and Wilson had Navy doctors, President Coolidge an Army doctor.)

McIntire's reputation as a specialist in diseases of the head (he is also a specialist in plastic surgery) greatly influenced his selection for the White House post. The new President was in good health, except for a minor but persistent sinus condition and a left ear which his physician has described as "a little down." No one, not excepting Mrs. Roosevelt '40, saw more of Franklin Roosevelt during his occupancy of the White House than did McIntire. He accompanied the President on all trips (he was in the Presidential party at the conferences in the North Atlantic, Teheran, Africa, and the Pacific), and every morning and evening he visited him professionally. When the President was in Washington McIntire's car was parked before the White House, where he had an office equipped for everything from dentistry to radio therapy. While Roosevelt ate his nine-o'clock breakfast from a bedside tray McIntire and three other men joined him for a daily talk. McIntire has said that he could tell more about Roosevelt's condition by an appraisal of his mood than by any routine medical check-up.

In campaign years, in answer to the repeated charges that Roosevelt was not physically fit for the strenuous job as head of the Nation, McIntire was called upon to make public statements concerning the President's health. In October 1944, when the charges were again renewed, McIntire reported that the President was in good condition for his sixty-two years: "Nothing wrong—perfectly O.K. . . .The stories that he is in bad health are . . . not true." The physician has been credited for the excellent health of his famous charge, which was maintained during his thirteen years in office. McIntire was in Washington when President Roosevelt died at Warm Springs from a cerebral hemorrhage. It was he, however, who directed Dr. James Paullin, the Atlanta specialist, to attend the President, and it was he who later broke the news to Mrs. Roosevelt, by saying, "The President has slept away."

U.S. Navy

VICE-ADM. ROSS T. MCINTIRE

Between his morning and evening calls on the President, McIntire attended to his naval duties (instructor and specialist in ophthalmology and otolaryngology from 1931 to 1938, Navy Surgeon General since 1938). In a chapter, "The Navy Doctor at War," which he contributed to the book, *Doctors at War* (1945), McIntire told the story of how his department had carried on during the war. "It is no longer a new story," said McIntire, "that the size of the Medical Department of the United States Navy in 1944 exceeded the strength of the entire Navy as it existed at the outbreak of World War II in 1939. We grew accustomed to counting our medical and dental officers and our nurses in the thousands, and our hospital corpsmen in the scores of thousands, although it was only a few years ago that they ran only into the hundreds. . . .Even before President Roosevelt's declaration of a state of national emergency in 1940, the Medical Department had begun to gear itself for any eventuality." Besides the increase in personnel, naval hospitals were built, Medical Department facilities were established at new bases in both the Atlantic and Pacific. Also, coincidental with the performance of this work was the research maintained in various branches of naval medicine in order to keep abreast of the rapidly changing developments brought about by war.

The destructiveness of total warfare demanded that Americans exercise their ingenuity, said McIntire. A great many gains were achieved, the treasury of medical knowledge enriched—all of which will be shared by the medical profession and the public at large. As a result of the tremendous progress, the great disparity between Navy-Marine casualties in the First World War and those in the Second "makes any comparison invidious." The mortality rate of wounded in 1917-18 was 12 per cent, in 1943 2.2 per cent. "As of March 31, 1944, more than 55 per cent of all sailors and

MCINTIRE, ROSS T.—*Continued*

marines wounded since Pearl Harbor—including the large number of casualties of that infamous day—had returned to active duty," reported McIntire. "Forty per cent were still under treatment, and a large portion of these could be expected to resume their regular duties in the near future. It was necessary to invalid less than 2 per cent from the service. Only three out of every hundred succumbed."

On December 1, 1942, McIntire was sworn in for a second term of four years as Surgeon General and Chief of the Bureau of Medicine and Surgery. Two years later, when President Roosevelt nominated McIntire and two other Navy Bureau chiefs for promotion from the rank of rear admiral to vice-admiral there was considerable opposition in Navy and Senate circles on the grounds that the rank was higher than any ever given officers serving on shore, primarily in administrative capacities. The New York *Times*'s prediction that the appointments would be confirmed by the Senate, because the appointees were "able men," was fulfilled on February 10, 1944.

In September 1945 McIntire resigned from his White House post to devote full time to his work with the Navy's Medical Department, which is still being expanded. (His term of office expires in December 1946.) The Vice-Admiral is described as "genial, but a stickler for medical and naval proprieties." He is stocky, broad-faced, full-mouthed, and bald. In 1923 he was married to Pauline Palmer. He is a Methodist, a Mason (Shriner), and a member of the Metropolitan and Burning Tree clubs in Washington. Besides holding a Fellowship in the American College of Surgeons, he is a member of the American Medical Association and the Association of Military Surgeons. The Navy physician has the Victory Medal with Escort Clasp, the American Defense Service Medal, and the Bronze Star. He has also received decorations from Brazil, Nicaragua, Sweden, Norway, Denmark, Belgium, France, Luxembourg, Poland, and French Morocco.

MCKEEVER, ED(WARD CLARK) Aug. 25, 1910- Football coach

Address: b. Cornell University, Ithaca, N.Y.; h. 101 Delaware Ave., Ithaca, N.Y.

One of the most brilliant young college football coaches in the United States is Ed McKeever of Cornell, who led the "Fighting Irish" of Notre Dame through the 1944 season. After nine years as assistant coach at Texas Technological College, Boston College, and Notre Dame, and one year as acting athletic director and head football coach at the last-named, McKeever became head coach at Cornell in 1945. "An expert developer of passers," he is given credit for the training of Charley O'Rourke and Mickey Connolly at Boston College, and of Angelo Bertelli, Johnny Lujack, and Frank Dancewicz at Notre Dame.

Born in San Antonio, Texas, on August 25, 1910, Edward Clark McKeever is the son of Irish Catholic parents, Hugh and Mary Ellen (Clark) McKeever. Mrs. McKeever died when Ed was fourteen. The boy was a good athlete, participating in three major sports at St. Edward's University preparatory school in Austin. Notre Dame's great football coach Knute Rockne was his idol; but when young Tex McKeever entered the Indiana university in 1929 he was too light for the football team, although "smart and fast" on the field. At the end of his freshman year, however, Ed had to go back to Texas because of his father's illness. And later, with the death of Rockne in March 1931, McKeever lost interest in playing for Notre Dame. When the boy left Indiana, according to Arthur Daley of the New York *Times*, he had exactly thirty-five cents. Another player collected twelve dollars toward his fare, which took him to St. Louis, and McKeever rode freight trains from there to Texas.

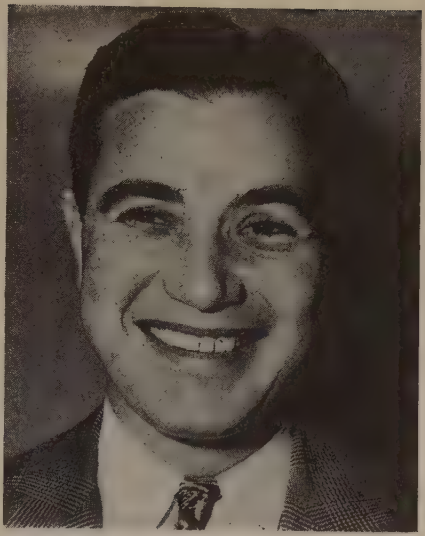
After some time as a cowhand McKeever entered the Texas Technological College. Pete Cawthon, its football coach, had been told about Ed, and found him a dingy room in the gymnasium basement. Next day, says Daley, "the room was polished and spotless. So was McKeever." To support himself and his invalid father, the youth made snakeskin belts. "I'd go out with a rake and catch me as many as a hundred [rattlesnakes] in a day, cure the skins, and make belts out of them," he recalls. "Those belts would sell at a dollar apiece, and sometimes, when I caught too many rattlers, I'd even cut prices and let them go at seventy-five cents each. . . .All it cost me was a dime for buying salt to use in curing the skins." At Texas Tech McKeever played right halfback, although he weighed only one hundred and sixty pounds, and called the plays which in three years won thirty victories out of thirty-five games. When he was graduated with the B.A. in 1935 Coach Cawthon retained him as backfield coach. (That May McKeever was married to Gail Quinlan, his childhood sweetheart.) McKeever was backfield lecturer at Cawthon's "immensely popular" summer school for coaches; and in 1938 the line lecturer, Frank Leahy of Fordham, attended his classes regularly.

In early 1939, when Leahy was appointed head coach at Boston College, he sent for Tex McKeever to be one of his three assistants. In addition to their work with the team, the coaches made frequent appearances before various organizations, making as many as five speeches a week, showing films of the team's football games, and stirring up interest in a way new to B.C. The team finished undefeated in 1939 and 1940, and won the Sugar Bowl game from the Southern champion after the second year. Then Leahy moved to Notre Dame as head coach and athletic director, taking McKeever with him.

After a successful season in 1941 Coach Leahy decided to introduce the T-formation, used by the professional Chicago Bears, in place of Rockne's famous "Notre Dame shift." He and his assistants drilled themselves on the new system, working out on the handball courts before introducing it at the 1942 spring practice. The much-discussed and much-criticized innovation did not seem to work out very well in the first two games of the season. When Leahy was taken ill and had to go to the Mayo Clinic for treatment, Ed McKeever took over. "I was so scared . . . that, instead of my calming the kids down, they calmed me down," he says. After long telephone conferences with his chief, the Texan presided over three games which everyone expected the Irish to lose but which they won, beating Stanford 27-0, the Iowa Pre-Flight Seahawks 28-0, and Illinois 21-14. This was the beginning of a string of victories after Leahy returned to Indiana. The next year, 1943, found Notre Dame with a team weakened by the loss of men inducted into the armed forces, and a heavy schedule which included some of the best teams in the country. Nevertheless, the Fighting Irish won all except the last game on their schedule, which went to the Great Lakes Naval Training School. After the close of the season Leahy entered the Navy as a lieutenant, and Ed McKeever took over as acting athletic director and head football coach.

During the 1944 season McKeever's team won eight of its ten games. The other two were overwhelming defeats by Army and Navy, but commentators praised the way the coach "juggled his undermanned squad with consummate skill, was a most gracious loser in crushing defeat . . . patched up a team that had taken two terrific goings-over and got it galloping again" to win three more games. One of these three was the first Notre Dame victory over Great Lakes. McKeever's team, like the other Notre Dame squads which sports writers insist on calling "The Irish," included names like Maggioli, Mergenthal, Adams, Dancewicz, Szymanski, Schuster, Westenkircher, and Gasparella. Their coach was immediately popular with reporters, who described him in such terms as "one of the ablest and most genuinely liked young coaches to come up in the game" and "that gay charmer from Texas."

In December 1944 McKeever denied reports that he was to be coach at Fordham University, stating that he had signed a contract to continue at Notre Dame. In early 1945, however, he accepted the post of head football coach at Cornell University. In Ithaca (New York) that March, he says, he found "a nice house and three real football players waiting" for him. By the time the season opened the coach had lost all three of them, one to professional football, one—Paul Robeson, Jr.—to the Army, and one as a Navy trainee. His inexperienced men averaged one hundred and eighty pounds in weight, less than many high school players in the South and Midwest. "We'll win some games on our spirit, even if we are a little on the small side," said McKeever. Newspapermen noted that "McKeever's enthusiasm has fired the entire team," and remarked that after twenty-five years of dour taskmasters, Cornell finally had a likable and considerate football coach. McKeever even agreed to let his players go out for track in season. In September 1945 Cornell's first game of the longest schedule in the Ivy League was a victory over Syracuse by 28-14. His men had been drilled in the T-formation, which was new to Cornell. "This 'T' stuff appeals to boys," the coach said. "It's a lot more fun to play, as well as more exciting to the spectators" than the single-wing formation. "Those quick-breaking plays practically guarantee a gain of three yards."



ED MCKEEVER

In the holiday between semesters of his first Cornell season, McKeever had to take his team apart and put it together again. The return of Army men, including Robeson, the transfer of Navy trainees, and wartime acceleration of college courses resulted in a situation where "total strangers whom Ed McKeever never laid eyes on were barging in to shake hands with their new coach and, with the schedule already half completed, stepping blithely into the first-string line-up. A two-week training camp in mid-season is uncommon enough in its own right," wrote Red Smith. "More curious still is the spectacle of a college squad taking two long workouts a day in October." With the single exception of Allen Dekdebrun, all Cornell's best backs were new or newly returned to the team, and other players were coming in at such a rate that, McKeever lamented, "as a squad we'll be together only Thursday and Friday before the Yale game."

Green-eyed "Big Ed" McKeever, whose speech is "pure Texas," has been described as possessing great charm and organizing ability, and as having "the same instinctive knowledge of human nature and psychology that made Rockne so great a coach." That he can make friends of a crowd of a thousand as easily as of a team of eleven was demonstrated in January 1945, when McKeever was inducted into the Circus Saints and Sinners. The coach's pet superstition is that he must wear a battered felt hat during games—it was on his head in 1942 when his Notre Dame players upset all predictions by winning from the Iowa Seahawks, and he was not wearing it in 1944 when Army beat Notre Dame 59-0. McKeever's twin daughters, Susan Helen and Jane Anne, were born in December 1940, just before the

MCKEEVER, ED—*Continued*

Sugar Bowl game, and their father gave the first two touchdown-scorers the privilege of naming them.

MCLEAN, ALICE T(HROCKMORTON) (măk-lān′) Mar. 8, 1886- President of the American Women's Voluntary Services

Address: b. AWVS National Headquarters, 345 Madison Ave., New York City; h. St. James, Long Island, N. Y.

When the board of directors of the American Women's Voluntary Services met in New York City in May 1945, President Truman '45 congratulated this organization of 325,000 women on its completion of "five years of helpful, constructive service to the Nation." At this time Alice T. McLean, founder and president of the AWVS, was re-elected to the presidency. Aside from her executive duties with one of the largest groups of uniformed women in America, Mrs. McLean is an expert horsewoman, the owner and manager of a large dairy and stock farm in upper New York State, and the mother of two sons in active service with the United States armed forces. She feels that the AWVS will best serve American communities in the postwar era by helping in the readjustment of the veteran and his family.

Virginia F. Stern

ALICE T. MCLEAN

The daughter of James T. and Sara (Throckmorton) McLean, Alice Throckmorton McLean was born on March 8, 1886. The English family of Throckmorton, Alice McLean's maternal ancestors, had been in the ambassadorial service of Queen Elizabeth (the Elizabethan spelling of the name was "Throgmorton"). James McLean was of Scotch ancestry. His father, whose home was on the Island of Mull off the coast of Scotland, came to the United States with his wife in the middle of the nineteenth century to visit American relatives and decided to make America his home. After purchasing a large tract of land in the hills at the headwaters of the Delaware River at South Kortright in Delaware County, New York, he built a "huge, handsome mansion in the Palladian pillared style," and this house became the family's summer home. Alice's mother was one of the first New York matrons to be interested in infant welfare and was one of the founders of the Bethlehem Day Nursery. Alice was the youngest of three daughters born to James and Sara McLean, and with her sisters lived with the family in their New York town house on East Fifty-fifth Street and attended Miss Chapin's School and the Spence School. Summers spent at the Delaware County home alternated with those in which James McLean took his family to Syria, Persia, Egypt, Turkey, and Greece. But when they were in Europe the McLeans usually spent the month of August at French resorts such as Grenoble and Aix-les-Bains. Alice loved travel, but the summers spent on the farm at South Kortright were especially happy ones.

Many years younger than her sisters, Alice was her father's constant companion. She visited mining camps with him, became acquainted with Diaz and Villa in Mexico City, and, as a *New Yorker* writer expresses it, "saw a good bit of big business in the making." Her father taught her to ride, to play polo, and to drive tandem. When she was thirteen he took her to Paris to learn the fine points of four-in-hand driving from an expert teacher. She also studied languages and learned to speak fluently in French, German, and Italian. At the age of seventeen, Miss McLean married Edward Larocque Tinker, a New York lawyer who later became a literary critic and the author of *Lafcadio Hearn's American Days* (1924) and other books. Two sons were born to the couple. Partly as a tribute to her father to whom she was devoted, Alice McLean resumed his name when she got her divorce. Her two sons also use the name of McLean. During the war one son, James McLean, as a captain was aide to General Scott at Fort Knox, Kentucky; the other, Edward T. McLean, was a lieutenant commander with the Naval Air Forces in the Pacific. There are three grandchildren.

As part of her active life as a horsewoman, Alice McLean went to England every autumn in the years following her divorce and hunted with "the Pytchley pack" in Northamptonshire. In 1938 she became interested in the Women's Voluntary Services which had recently been formed in England, and her volunteer work with this group led her to make a study of other women's organizations—the Finnish and the Swiss. Becoming convinced that the war which had started in Europe would eventually involve the United States, she returned to America, and in the fall of 1939 designed posters intended to promote the things women could do in their communities for social and war relief. Friends helped her place these posters in restaurants and post offices. At this time she had no intention of founding an organization which would be completely dedicated to war work. "It seemed to me," she said in reviewing this period, "that an organization without creed or politics, giving community service, was needed—not to compete with other organizations but to help and stimulate them." Although she had previously worked with social agencies, this was her first attempt at organization, and the business training which her father had given her was of great help to her in this pioneer charting.

In 1940 the AWVS was founded, in a basement shop on East Sixty-second Street. By the end of the year the newly formed group had moved into an East Fifty-first Street mansion which was lent to it for headquarters. The aims of the organization during its first year were not so clearly formulated as they were to become later. In England at this time the W.V.S. had a membership of a million women, and every city and hamlet had its corps of uniformed ambulance drivers, evacuation clerks, and air-raid wardens. But, as the *New Yorker* points out, America not only was not at war at this time but was at the peak of its isolationism, and to the general "complacency" in regard to war in general was added the confusion of Army and Navy officials, municipal authorities, and politicians in the matter of what work volunteer women should do. Nevertheless, Mrs. McLean "got the AWVS going principally through her own tenacity and her belief in what she was doing." As these were the days of London's bombings by the Germans, American households following British example, were busy assembling sand buckets and water pails against the possibility of enemy bombs. When classes were offered by the AWVS in first aid and air-raid precautions, housewives joined them in order to learn new techniques which might be needed for war. Even before Pearl Harbor, AWVS membership had reached 18,362. When New York had its first false air raid alarms the AWVS sent its Civilian Protection Unit out into the streets, and when the *S.S. Normandie* burned, the AWVS canteen worked for twenty hours dispensing coffee and doughnuts to the firefighters.

In seven months after the entrance of the United States into the Second World War, fifty thousand new members were enrolled in New York alone. Mrs. McLean worked assiduously during this organization period. A story is told of a barbecue which she planned on her Delaware County farm for two hundred and fifty people; when three thousand neighbors appeared, she hastily added a steer and six hind quarters to the menu and sent a car with a loud speaker throughout the countryside inviting the whole valley to come. She then took advantage of the opportunity to tell about the AWVS with the result that ten new units were formed. By 1942 AWVS had "settled into its realistic stride," its aim at that time being to prepare women to serve the community in every way possible during the war, with long-range plans for training women in motor mechanics, emergency feeding, code practice, emergency switchboard operations, defense photography, and map reading.

In 1945 the AWVS has 325,000 volunteers enrolled from thirty-three states, the District of Columbia, and Alaska. The services are adapted from time to time to local communities, but in general they include child care, workshops, conservation and salvage, canteens, war service photography, rehabilitation work, and motor transport. In San Francisco AWVS volunteers have taught Braille to sailors blinded while swimming away through flames from sinking tankers; in Hollywood, nightly "chow trips" were made to Coast Guard stations and to air and fire watchers on remote posts; also, California AWVS obtained trained women fruit pickers to replace men called into service and Japanese farmers removed to relocation camps.

Between January 1940 and V-E Day, AWVS members sold over a billion dollars' worth of War Bonds and Stamps. Other outstanding activities of the AWVS War Service include: the taking of 30,000 pictures of men and women in the service and of servicemen's babies by AWVS War Service Photography and mailing the pictures all over the world; 1,033,964 articles turned out during a single year by AWVS workshops, including articles for the serviceman, layettes and children's clothes for his family, reconditioned and new garments and linens for hospitals and institutions; organization of over 200 Junior Auxiliaries with a specially planned program for over 32,000 teenagers; training of over 2,000 volunteers to operate salvage depots in cooperation with the War Production Board. The AWVS Motor Transport Service is on call twenty-four hours a day, seven days a week and drives approximately 350 Army and Navy vehicles each day in addition to its own fleet of cars.

Faced with a manpower shortage and curtailed yard goods for civilian use, the AWVS in May 1944 launched the National Clothing Conservation Program. Its purpose was to teach American women to conserve good materials in used clothing, enable women whose incomes were restricted to maintain their standard of living; help fight inflation and provide a wartime and postwar sewing project. Courses in pattern use, repair and care of clothing, and general sewing hints were sent to AWVS units and workshops. A group of leading American designers undertook to redesign worn and outmoded garments and these garments together with AWVS adaptations made in AWVS workshops formed the basis for a popular *Remake Revue* which has been presented more than eighty times in leading cities throughout the country. Over 200,000 of the AWVS "remake booklets" have been distributed to schools, colleges, clubs, store audiences, conventions, forums, and Government agencies, and are now being sent to foreign countries on request.

In November 1944, when twelve AWVS state chairmen met in New York City for a three-day conference, a nine-point program was adopted for the postwar era, in the fields of veteran rehabilitation, youth programs, job retraining for women, public health, conservation and salvage, thrift, motor transport service, canteens, and workshops. Governor Thomas E. Dewey '44 of New York has expressed his ap-

MCLEAN, ALICE T.—*Continued*

proval of the services of the AWVS and the hope of their continuation in the postwar period.

The organization is supported by the per capita fees of its members, and contributions. The organization is composed of local units which raise their own funds for their local activities in line with the over-all program. Wearing of the AWVS blue-gray uniform is optional. The organization is considered one of the most democratic in the country. Women of all races, creeds, and colors are welcomed to membership. It is nonpartisan and is engaged in recruiting, training, and placing volunteers for service to the country, community, and the American people. At one time one unit consisted of 1,200 office workers employed on Wall Street and lower Broadway in New York, and there are units in the International Ladies' Garment Workers Union and in the Milliners' Union. There are also three Chinese units.

Mrs. McLean's work with the AWVS is a purely patriotic effort. Since 1940 she has made several trips abroad, where she gathered first-hand information regarding the W.V.S. of Great Britain. (Correspondence is also carried on between the AWVS and women's voluntary organizations in forty-five countries.) In 1944 Mrs. McLean was chosen as one of the country's sixteen outstanding women from the viewpoint of interracial unity by Mrs. Mary McLeod Bethune '42, president of the National Council of Negro Women. In the words of the *New Yorker*, "sectarianism and politics seem to have passed her by. As a result her AWVS is a seething, super-democratic mixture of Jeffersonians, New Dealers, Fusionists, Father Diviners, Episcopalians, Fundamentalists, trade unionists, and Black Republicans."

The "lady squire" who directs the AWVS is a "small, personable, unmilitant" woman with dark brown hair, brown eyes, and "the iron hands of a horsewoman." On her farm are rare Galloway beef cattle brought over from Scotland, two dozen prize Jersey milch cows, a large kennel of pedigreed dogs, and horses of various breeds. Mrs. McLean used to breed her own hunters and was formerly assistant Master of the Hunt of the Smithtown Hounds at St. James, Long Island, where she has a home. In Delaware County she knows all the farmers for miles around and is admired by them for her practical husbandry—she is "as good as a man with crops, an absolute natural with horses." An indefatigible worker in her AWVS office, Mrs. McLean often telephones her staff in the middle of the night. She dictates her correspondence while walking about her office, and she has had to do most of the managing of her farm by telephone from her New York headquarters. In May 1945 Mrs. McLean cabled from England that the British Women's Voluntary Services "had not stopped for a vacation after V-E." Similarly, she and the AWVS are seen as facing America's postwar problems "with vision and gallantry." In August 1945 she again sailed for Europe to study relief conditions and the possible role of the AWVS in rehabilitation work there. In November Mrs. McLean sponsored a week-end conference at her home at South Kortright. A resolution was drafted urging President Truman to appoint women to the United Nations Assembly which will meet in London in January 1946.

MCMAHON (JAMES O')BRIEN (măk-măn') Oct. 6, 1903- United States Senator from Connecticut; lawyer

Address: b. The Capitol, Washington, D.C.; h. Norwalk, Conn.

One of the most important chairmanships in the United States Senate, that of the Special Committee on Atomic Energy, was given in October 1945 to one of the youngest and newest Senators, Brien McMahon, Democrat of Connecticut. Although the Senate seat is McMahon's first elective office, he had earlier experience in a Federal office as an Assistant Attorney General, when he brought to trial the Harlan County Coal Operators Association. He is deeply conscious that atomic energy is "the most important question of our national history," but he is also "an effective operator, who can take care of himself in the rough-and-tumble of politics."

James O'Brien McMahon was born in Norwalk, Connecticut, on October 6, 1903. "My family's been living in Norwalk more than a hundred years," he told an interviewer. The son of William H. and Eugenie J. (O'Brien) McMahon, he was named James O'Brien after his grandfather, but he has whittled his prenames down to Brien. After attending the Norwalk public grammar and high schools, McMahon went to Fordham University, the Jesuit institution in New York, where his classmates prophetically nicknamed him "The Senator." Graduated at twenty, in 1924, McMahon studied law at Yale, and after receiving his LL.B. in 1927 was admitted to the Connecticut bar. Then he entered practice with the firm of Keogh and Candee in his native city.

After six years of private practice, young McMahon became a judge of the Norwalk City Court in 1933. Later that year he was appointed special assistant to Attorney General Homer S. Cummings, under whom his first work was the prosecution of tax cases. In 1935 McMahon was made acting Assistant Attorney General in charge of the Criminal Division, and in 1936 he became the head of that division. Here he worked on the prosecution of gangsters, and sent John Dillinger's attorney to prison for harboring the fugitive. In all, McMahon argued twenty cases before the Supreme Court, and did not lose one. He served also as chairman of the Attorney General's Committee on Survey of Release Procedures, whose findings were published by the Department of Justice in 1939.

McMahon handled the first prosecution under the Wagner '41 Labor Relations Act, that of the Harlan County (Kentucky) Coal Operators Association. Their coal fields had been known as "Bloody Harlan" since 1931, when the operators began to use measures which later resulted in charges that their workers were intimidated and unionism suppressed. The Federal indictment followed revelations before the National Labor Relations Board and the

Senate Civil Liberties Committee. Brien McMahon directed the legal staff which aimed in 1938 at conviction of forty-four individuals. Since the Wagner Act specified no penalties for employers violating their employees' rights to organize and bargain collectively, the Government also invoked the Civil Rights Statute of 1870, aimed at the Ku Klux Klan, which made it a crime to conspire to deprive citizens of their constitutional or statutory rights. At the trial, McMahon faced two main problems, the first being to prove that the operators actually conspired to suppress the miners' rights—not merely that such suppression occurred. The second and perhaps more serious disadvantage was the nature of the jury, farmers and storekeepers of that section of Kentucky where persons from other States and agents of the Federal Government itself were regarded as "foreigners."

"The Irish Yankee speech of Brien McMahon, chief prosecutor, apparently gave the jury some difficulty at first," it was reported. However, the jury was also "discovering that there is no monopoly on courtliness and gallantry in the South" and noting "the calmness and comparative gentleness of the Government attorneys in handling witnesses." The eleven-week trial in 1938 was marked by bomb-throwing and fatal shootings. As the jury was deadlocked, the case ended in a mistrial; but its main objective, to establish the miners' right to bargain collectively, was achieved, as twenty-six days later the operators signed an agreement with the United Mine Workers (CIO). The NLRB thereupon dropped the charges, although McMahon denied that such a commitment had been made.

According to the New York *Herald Tribune,* the Connecticut lawyer worked on the McKesson and Robbins embezzlement case before his return to private practice in 1939. Remaining in Washington, McMahon was married in February 1940 to Rosemary Turner. When he returned to public life more than four years later, it was to run for the Senate from his native state. In his first candidacy, McMahon opposed the incumbent Republican, John Danaher, who was regarded as an ardent isolationist. Running on a platform of support for President Roosevelt's '42 foreign policy, and denouncing all appeals to racial or religious groupings, the lawyer delivered two hundred campaign speeches. When Danaher denied that he was an isolationist and countered that the word was vague and undefined, McMahon "gave him a fresh definition every day for the last thirty days."

"With two Irishmen fighting it out," the campaign was described as lively and spectacular. Out of 822,464 votes cast for Senatorial candidates in Connecticut in November 1944, McMahon was given 430,716 to Senator Danaher's 391,748. While election saw the replacement by internationalists of several Republican isolationists, Brien McMahon's victory over Danaher vied with that of Emily Taft Douglas '45 over Day of Illinois for the title of "biggest surprise."

Beginning his six-year term in January 1945, McMahon was named at the Democratic caucus to four standing committees: Claims, Expenditures in the Executive Departments, Finance, and Interstate Commerce. He was also chosen to sit on James E. Murray's '45 three-year-old Special Committee to Study and Survey Problems of Small Business Enterprises. From the first, Senator McMahon's record votes "went down the line" of Administration support: They included votes for confirming Henry Wallace '40 as Secretary of Commerce without removing the RFC lending agencies from his jurisdiction; for ratifying the water treaty with Mexico, participating in the Bretton Woods monetary agreements, and ratifying the United Nations Organization charter; and he made his maiden speech, a fiery one, against any limitation of the President's powers of tariff adjustment under the Reciprocal Trade Agreements Act. He voted against the automatic termination of Lend Lease at the end of the war, an issue which split the Senate 39-39, and on which Vice-President Truman '45 broke the tie by casting his first vote since taking office against the amendment. In September 1945 McMahon, majority leader Barkley '41, and Hartley M. Kilgore '43 of West Virginia "battled with their back to the wall" against requiring that the US Employment Service be returned to the individual states within ninety days after the war. He voted for the O'Mahoney '45-Wagner-Murray-Thomas '42 full employment bill, but with the unopposed Taft '40-Radcliffe amendment which reversed its original philosophy by requiring that the Federal budget for the peacetime years after 1947 be accompanied by a tax program designed to "prevent any increase in the national debt over a reasonable period."

BRIEN MCMAHON

Senate tradition holds that freshmen of that body should be seen and not heard, but Brien McMahon made his presence felt. Early in the session he became a member of Senator Pepper's '41 subcommittee on foreign trade. He advocated complete removal of a surplus disposal agency from War Mobilizer James F. Byrnes's '41 jurisdiction in March; and in April when it had been transferred to the Department of Commerce, introduced a bill to establish the board as a separate agency. In May he supported a measure to apply the income tax

MCMAHON, BRIEN—*Continued*

to aliens living in the United States, who, he charged, were getting rich from speculation in Wall Street. Later that month McMahon was chosen chairman of the Small Business subcommittee of inquiry on labor-management relations. In late June the Senator introduced a bill to divorce the board of parole from the Department of Justice, having it appointed instead by the President. In August he asked President Truman to "propose to the United Nations the formation of a group, similar in scope and ability to that formed to work on the atomic bomb . . . in an effort to discover causes and cures for the deadly diseases of mankind." In September 1945, after a series of hearings behind closed doors, McMahon and three other Democrats considered to be pro-labor (Hayden of Arizona, Tunnell of Delaware, and Military Affairs Chairman Elbert Thomas), jointly introduced a bill for the peaceful settlement of labor disputes on a voluntary basis. The chief provisions were for: impartial boards of inquiry for issues involving the public interest; a Division of Mediation and Conciliation in the Department of Labor, which would be freed from civil service restrictions on salaries in order to attract top talent; transferring to the new Division the War Labor Board's Disputes Section, and a three-man board of arbitration, to be called on voluntarily but whose decisions would be binding (although subject to judicial review).

McMahon introduced the first bill dealing with atomic energy into the Senate. To prevent unlimited private exploitation, it called for a Government board (composed of six Cabinet members, the chairman of the Federal Power Commission, and a chairman appointed by the President) "to develop, control, and supervise the use and application of atomic energy," and to "license its use on an equal basis to all comers." McMahon further "adopted the proposition that we should turn over to the Security Council of the United Nations what we know about atomic energy in return for every member of the United Nations making available to us and to the other members of the Security Council all information and know-how that they might have on armaments and weapons of war. I also provided," he says, "that the Security Council would have the right to inspect all plants and laboratories or operations in every country of the world to see whether the agreement was being kept, and that after the agreement was made it should not become effective until approved by the Congress of the United States." Introduced the first day after the Congressional recess, the bill was referred to the Foreign Relations Committee

In October 1945 the junior Senator from Connecticut offered a resolution, which was approved by the Interstate Commerce Committee, to authorize a special committee of nine members to study the development, use, and control of atomic energy. The Senate raised the number of committeemen to eleven and passed the resolution by unanimous voice vote. By Senate tradition, the sponsor of such a resolution becomes chairman of the resultant committee, but in this case there was opposition to giving so important a post to a first-termer who had just celebrated his forty-second birthday. After a struggle marked by parliamentary maneuvering, President of the Senate Kenneth McKellar gave McMahon the chairmanship. He was, however, exceeded in years and seniority by the other members: the Democrats were Edwin C. Johnson, acting chairman of the Military Affairs Committee and co-sponsor of the May '41-Johnson bill for military control of atomic research; Tom Connally '41, Foreign Relations chairman and member of the Mead '44 war investigating committee; and three from Naval Affairs—Richard B. Russell, Harry F. Byrd '42, and Millard E. Tydings '45. The Republican members were Senators Vandenberg '40, Millikin, Austin '44, Hart '42, and Hickenlooper. Altogether, it was what one columnist called "a group of the Senate's most conservative mossbacks."

Unlike the sponsors of the War Department- and Administration-backed May-Johnson bill, McMahon planned a full investigation of the problem before reaching any solution. "Within a few hours after his appointment was announced," it was reported, "McMahon had dispatched wires to key groups and individuals throughout the country in an effort to secure the services of an eminent atomic scientist who could work full time with the Committee on the May-Johnson atomic control bill." In early November the committee agreed to engage Dr. Edward U. Condon, director of the Bureau of Standards, as scientific adviser, and James R. Newman, whom *PM* described as a "prominent young liberal lawyer," as legal assistant. They planned to embark on a detailed inspection of the plants and processes involved in manufacturing the atomic bomb. Chairman McMahon's own bill was transferred to his committee for consideration. At the same time, as it happened, the Connecticut Senator moved into the historic Capitol suite formerly occupied by the isolationist veteran Hiram Johnson '41; McMahon got it on waivers from his seniors, none of whom cared to leave the Senate Office Building.

Before opening the hearings, the Senator and his whole committee went to the Bureau of Standards and took a course in nuclear physics in order to prepare themselves for the testimony of scientists. "In Senator McMahon's committee," wrote Nina Heidelberger in a League of Women Voters publication, "we see the first bright hope . . . that our legislators will be as willing [as the physicists] to change their political thinking to meet the challenge of the atomic age." Commentators remarked on the objectivity and purely factual tension of the hearings, contrasting them with the much publicized and strongly partisan Pearl Harbor investigation going on around the corner. "If there is ever an atomic Pearl Harbor," said Brien McMahon, "there won't be a coroner's jury of statesmen left to talk about it."

In the words of Anthony Leviero, writing in the December 15, 1945, New York *Times*, "the nature of the hearing is almost unprecedented in the annals of Congress. As yet there has been no partisan taint. . . .The current hearings of nuclear energy resemble a series of Platonic dialogues in which pragmatic politicians and empirical scientists think out loud, preparing for a new code of international ethics by which the nations of the world may live in the atomic era. . . .The mental struggle that goes on as the committee and witnesses cope with so unusual a thesis often gets excruciating for the onlooker and must be painful occasionally for the participants." Other writers agreed, the *Christian Science Monitor*'s Richard L. Strout saying, "There was no politics at this Senate hearing. We were too much immersed in the future." Joseph and Stewart Alsop mentioned "the singular dedication which has overtaken Senator McMahon," whom they considered "an intelligent, somewhat paunchy, somewhat liverish politician of the type rarely given to crusades."

Just before the Christmas recess McMahon introduced a bill, milder than the shelved May-Johnson proposal and free of the latter's military-mindedness and rigid secrecy provisions. The new bill would establish a full-time paid commission (no dollar-a-year men), appointed by the President and confirmed by the Senate, to conduct research and development in nuclear processes, production of atomic energy, and the use of fissionable materials for health and industrial uses. This commission was to have exclusive control of all atomic-powered weapons and of the materials and natural resources necessary to produce them; and private ownership or exportation of fissionable materials was to be forbidden. No security regulations other than those of the existing Espionage Act were included in the bill, nor did it exempt military and naval officers from the operations of the statutes which would bar them from serving on the proposed board. The commission would be required to report to Congress on the economic, political, and social implications of any new developments and of applications for industrial licenses; and licenses for private industrial development could be granted only with Congressional approval. All bills thus far introduced provided for complete Federal control over "A-power" from mine to use, but the McMahon bill was preferred by the Federation of Atomic Scientists, who also seemed to prefer it as a model for future international controls. McMahon let it be known that he was working closely with Secretary of State Byrnes on the domestic and international phases of the question, and he proposed that foreign governments be invited to send observers to the planned naval tests of the atomic bomb at Bikini atoll.

The first Fordham alumnus to enter the Senate, Brien McMahon was elected first vice-president of its alumni association in March 1945, and was honored with a Doctorate of Laws in June. Blue-eyed, black-haired, and ruddy-complexioned, the Senator is described as "definitely on the handsome side," and also as "definitely chunky." He is of medium height and weighs about 200 pounds. His fraternity is Phi Alpha Delta, and he is a member of the American Bar Association. McMahon is said to be a better-than-average golfer; he belongs to country clubs in Connecticut and Maryland, and to the Burning Tree Club in Washington. He and Mrs. McMahon have one daughter, Patricia Rosemary. The junior Senator from Connecticut is said to read widely and is fond of broiling a steak over an outdoor charcoal fire.

MACPHAIL, LARRY Feb. 3, 1890- Baseball club president; businessman

Address: b. New York Yankees Baseball Club, 55 W. 42d St., New York City; h. Belair, Md.

In January 1945 the sports world was surprised by the announcement that "Loud Larry" MacPhail, who was being rumored for appointment as Federal sports coordinator, was quietly concluding negotiations to purchase the famous old New York Yankees Baseball Club. Larry MacPhail, known in the United States Army as Colonel Leland Stanford MacPhail, was born in Cass City, Michigan, on February 3, 1890, to an immigrant Scottish storekeeper whose forebears had been neighbors of Robert Burns. During Larry's youth his father branched out into banking in Ludington, Michigan, and "as he traveled from one town to another, establishing banks, the family went along." Eventually there were twenty-one of these small-town banks, which the MacPhails liquidated without loss during the depression of the thirties.

Larry went to various Michigan schools, where he was an outstanding student and athlete; at fourteen he played the organ in the Scottville Episcopal Church. Entered in a military school at Staunton, Virginia, he continued to win scholastic and athletic honors. At sixteen he passed entrance examinations for the Naval Academy, but his parents advised against his going to Annapolis so young. He registered instead at Beloit College, Wisconsin, where he continued to be a good student and athlete, and became a member of Beta Theta Pi. Two years of success as "one of the loudest debaters in the history of Beloit College" determined him on law, rather than the Navy, and from Beloit he went to the University of Michigan Law School. With the idea of going into the consular service, Larry MacPhail transferred to George Washington University a year later. In 1910, when he was twenty, the tall, dynamic redhead completed the work for his LL.B. and that same year was offered a consular appointment to a French seaport, which he declined. Having passed the bar examinations of Michigan, Illinois, and the District of Columbia, MacPhail joined a Chicago law firm, and was married to Inez Thompson of Oak Park, Illinois, daughter of an American Car and Foundry Company vice-president. (There are three children, a daughter and two sons, both of whom were in the wartime Navy. Leland Stanford, Jr., is also a baseball businessman. Their father, after five years' separation from their mother, was divorced, and was married to Jean Bennett Wanamaker in May 1945.)

After six months, during which the Chicago firm failed to make him a partner, the impatient young lawyer left to become a junior partner in another, which thus became Fowler, McDonald, Rosenberg, and MacPhail. Given the assignment of reorganizing a tool company, MacPhail carried it out to such effect that, when the reorganization was completed,

LARRY MACPHAIL

MacPhail joined the tool company. A year later the twenty-four-year-old "boy wonder" was called to Nashville, Tennessee, to head a large department store. There he became friendly with Senator Luke Lea. When the country entered the World War in April 1917 the two young executives organized a volunteer regiment of hardbitten Tennessee backwoodsmen (Tennessee is known as the Volunteer State), with Colonel Lea commanding and MacPhail a mere private.

Private MacPhail rose rapidly, however, and when the regiment was taken into the Army of the United States as the 114th Field Artillery he was commissioned a captain. (The volunteers agreed, by the way, not to accept any decorations from foreign governments.) They served with the Thirtieth Division, better known as the Old Hickory outfit, and fought in the Saint-Mihiel and Argonne offensives, where MacPhail was wounded and gassed. (A result was the weakening of his eyes.) After the Armistice he and his colonel, accompanied by six of their men, celebrated the New Year with a lighthearted attempt to kidnap Kaiser Wilhelm from a castle in Amerongen, Holland, which involved cutting all telephone and fence wires. This caused a great furor and a formal inquiry, but Lea got off with an official reprimand, and MacPhail with one of the Kaiser's ashtrays, which he still has for a souvenir.

After MacPhail's discharge from the Army he settled in Columbus, Ohio, where he remained until 1933. "Among other things," writes Robert Lewis Taylor, "he took charge of the liquidation of several glass factories; refereed Big Ten [Midwestern state college and university] football games; traded in Columbus real estate; and obtained a controlling interest in a large automobile agency. As a result of these and earlier business activities, he was able in 1930 to put up about a hundred thousand dollars to buy the American Association baseball team in Columbus." Taylor continues: "It was when MacPhail became a baseball magnate that he really began to find himself. . . .Once free of the taint of law and commerce, his personality unfolded like a morning glory. His clothing assumed such vivid variety that one of his Columbus acquaintances described it as a municipal eyesore. . . .He had never had his fill of airplane travel. As a result, he transported his baseball players solely by plane. A half hour before the game the team would drop down from the sky, with some of the players too airsick to lift a bat."

Eventually, MacPhail sold his team to the St. Louis Cardinals (National League), but their shrewd vice-president, Branch Rickey, persuaded him to stay on for three years as the Columbus club's president. (It was during this period that the Cardinal "front office" sent Billy Southworth '44 to MacPhail as manager for part of one unhappy season.) In 1933, with the "bedraggled" team established as a financial success, Larry MacPhail moved to the major leagues by becoming vice-president and business manager of the Cincinnati Reds (National League). The president, one of the principal financial backers, was Powel Crosley, Jr., the radio and refrigerator manufacturer. Crosley combined the first of these interests with baseball by summoning Red Barber '42 from Florida, where Barber was WRUF's leading announcer, to describe the Reds' games over the Crosley stations WSAI and WLW. Leaving no stone unturned in his promotion plans, Larry MacPhail repainted the ball park a gay orange, staffed it with pretty usherettes, made it the scene of all sorts of publicity stunts, and introduced a few night games into the schedule, an innovation much protested against by baseball men, but one which brought in many spectators who would not have attended an afternoon game. With such methods MacPhail established "a solid reputation for unpredictability." An explosive man, he was generous in money matters, causing his associates to conclude: "You can work for MacPhail forever—if you can stand him."

But MacPhail, with his sure instinct for flamboyant publicity, was not merely a sensationalist. A notably shrewd trader, behind the horseplay he was building the last-place Reds into a solid baseball organization. He left baseball in 1937, feeling that the strain was making him nervous, and the club went back that year from fifth place to eighth and last; but the farm system he founded for recruiting and training baseball talent is credited by observers with Cincinnati's two successive league pennants, the second followed by a World Series "killing," in 1939 and 1940. (The "farm club" method, which was initiated by Branch Rickey at St. Louis in 1919 and is now standard in baseball, is that by which the major league teams "get their players from the original source of supply—the Nation's sand lots—and develop them under capable supervision on the parent team's plentiful farms" or hierarchy of minor league clubs.)

Back in Michigan, MacPhail joined his father and brother in the investment business. A year later the Brooklyn Trust Company asked him to take over and "straighten out" the Brooklyn Dodgers. The fourth time they asked, he accepted. Perhaps the very difficulty of the task was a challenge; perhaps MacPhail felt himself drawn to a team whose reputation for colorful eccentricity went back to the days when they were the "Trolley Dodgers." Anyway, he found that he got "about seventeen summonses a week" at first, for the Dodgers management owed fully $1,200,000. The owners were neatly split into two mutually hostile groups, each of whose 50 per cent of the stock votes canceled out the other's, and the team itself was a serious rival of the Phillies for last place in the National League. Accepting the job on his own terms, MacPhail became vice-president and general manager, with full authority, plus the guaranty of working capital from the bank for improvements.

In Brooklyn Larry MacPhail really "went to town." After spending two hundred thousand dollars on refurbishing the ball park, including the provision of a luxurious free bar for newspapermen and hangers-on and of a drill-master for the gorgeously caparisoned ushers, he made his first step toward providing a team for it: For fifty thousand dollars he bought the right to sign up Dolph Camilli, star first baseman from the Phillies. MacPhail hired fifteen talent scouts and kept them busy; and he built up a farm system by buying six minor league clubs outright and establishing "working agreements" with six more (giving the Dodgers first choice of their promising players in return for financial support). He spent more than eight hundred and eighty thousand dollars to obtain the contracts of stars like Kirby Higbe, Joe Medwick, Mickey Owen, Pee Wee Reese, and Pete Reiser (who cost only one hundred dollars to get from one of the farms); also Tex Carleton, Whit Wyatt, Dixie Walker, Billy Herman, and others, including almost the entire roster of St. Louis Cardinal stars. He introduced night baseball, over the protests of the other New York teams, and played it with circusy "hoopla," from fireworks to footraces. And he brought in the crowds.

To build up the Brooklyn team's box office MacPhail succeeded in arousing borough patriotism in the denizens of that much-abused section, and in identifying the team with the town, though his administrative organization members had been brought almost intact from Cincinnati, and his players from St. Louis. Red Barber with his Southern dialect became known as the "Voice of Brooklyn." L. S. MacPhail himself was then living in Manhattan (his country home is a large Maryland stock farm, where he raises black Angus cattle). He and "Lippy Leo" Durocher '40, made manager in 1938, rivaled each other in picturesque language, and together they excelled in harassing umpires. This gave the Brooklyn fans a comforting certainty that they would not be "robbed"; it attracted patrons who came to see the fighting, and others who so disliked the Dodgers that they would gladly pay their money for a chance to see them beaten; it got reams of publicity, which in itself pays off at the box office.

At the end of the 1938 season the stockholders voted MacPhail a forty-thousand-dollar salary and the presidency; in 1939 and 1940 they voted him fifty-five thousand. In the 1939 season the Dodgers bounded from seventh place to third; in 1940 they were second to MacPhail's old team, the Cincinnati Reds; and in 1941 the roaring Brooklynites were up on top, winning their first pennant since 1920. Although they lost the post-season World Series championship to the "unbeatable" American League Yankees—4 to 1—the one game they did win was a moral victory: they broke up the other team's winning streak of ten Series games in succession. In 1942, however, the Dodgers were back in second place, to the disappointment of fans and stockholders. That year a full 45 per cent of all paid admissions to National League games was for Dodger games, and one million was the total attendance in relatively small Ebbets Field; but there were rumors that the Dodger owners, spoiled by a quick rise after a long depression, were dissatisfied with MacPhail. That fall the "Flatbush Firecracker," who was honorary Brooklyn chairman of the Committee to Defend America by Aiding the Allies, entered the Army with a temporary commission as lieutenant colonel. Reportedly, he was "hopeful that his fighting experience (World War I . . . and fisticuffs) would get him combat duty."

As special assistant to the Under-Secretary of War, Robert P. Patterson '41, Colonel MacPhail went to work at Lieutenant General Brehon Somevell's '42 Service of Supply (later Army Service Forces) headquarters in Washington. Although he did a serious job handling "public relations work on industrial conferences," and made inspection tours with his superiors on the French and Italian fronts, the old MacPhail cropped up now and then. There is, for instance, the story that reporters found him laying down the law to a two-star general—on a social occasion.

On January 26, 1945, when MacPhail was a full colonel, the sports world learned that he and two others had formed a syndicate and negotiated the purchase of the New York Yankees, baseball's most valuable and dignified organization. (The others were Captain Dan Topping of the Marine Corps, and Del Webb of Arizona.) Reportedly, "MacPhail just had to get a job somewhere, as he could not maintain his big Maryland stock farm on Army pay." This was nice work if he could get it—and he did. Ninety-eight per cent ownership of the Yankee "empire," never appraised at less than four million dollars, went for less than three million dollars ($2,800,000), as the syndicate had caught the owners short of cash to pay the high income taxes. This included not only the ten-time-champion Yankees themselves, but their three-million-dollar stadium, "the House that Ruth '44 Built"; the Newark Bears and Kansas City Blues, with their parks; and other minor league farm teams in Binghamton, Norfolk, and Wellsville—all of which showed a profit. The most interesting aspect of the situation was the question of what would happen when the flamboyant MacPhail (placed on reserve in February by the Army) began his contractual ten years as president and general manager of a great team whose conservative traditions he had often criticized for lacking in color.

Soon after taking over the Yankees, MacPhail brought pressure to bear on the big league powers to elect a successor to Kenesaw Mountain Landis '44 as baseball commissioner, a post left vacant by the death of Judge Landis

MACPHAIL, LARRY—*Continued*

in November 1944. James A. Farley '44 and Ford C. Frick '45, president of the National League, had been mentioned for the post, but with the backing of MacPhail, Senator Albert B. ("Happy") Chandler '43 of Kentucky was elected in April 1945 for a seven-year term, the second commissioner since the office was established in 1920. In November MacPhail signed up such prewar stars as Joe DiMaggio, Spurgeon Chandler, and many others for the 1946 season. A recent innovation at the Yankee Stadium has been the introduction of floodlights for night games, which had been a financial success at Ebbets Field.

A question on which MacPhail expressed himself was the use of Negro players in the major leagues. He was opposed to the color line in baseball: "I'd jump at the chance to sit down with anyone to see what could be worked out." He did meet with civic leaders, Negro and white, to discuss the matter, then went off to war and nothing came of it. A year later Mayor La Guardia, in August 1945, appointed a committee of ten prominent men of both races from various walks of life (among them MacPhail and Rickey of the Dodgers) to make a thorough survey and to submit recommendations to both major baseball leagues.

The Colonel himself, in MacPhail family tradition a Republican, is a colorful man literally, as well as figuratively. "He stands slightly over six feet in his socks, weighs a hundred and ninety-five pounds, and has the neck of a bouncer. His hair is bright red, and his face, which is about the same shade, is liberally freckled." His eyes are blue, and his expression, in rare moments of repose, is described as grim. Before he went into uniform, MacPhail's clothes were described as "a wild profusion of plaids." The new Yankee president is given to wearing dark glasses, to protect himself from autograph seekers and the sun; he plays the piano expertly, his favorite composer being Tchaikovsky, but he holds that the chirping of the wrens in his hundred and fifty birdhouses on the shores of Lake Michigan is the finest music on earth.

MCPHARLIN, PAUL Dec. 22, 1903- Designer; puppetry authority

Address: b. c/o J. Gordon Carr, 80 W. 40th St., New York City; h. 155 Wimbleton Dr., Birmingham, Mich.

"My urge toward the use of the pen whether for writing or drawing has taken me into the field of the book for authoring, editing, designing, illustrating, publishing, and complete production," says Paul McPharlin, who is also industrial designer and authority on puppetry, the latter from the point of both research and production. His contributions to the literature of these fields have appeared in art, theatrical, and publishing periodicals.

Paul McPharlin's native city is Detroit, Michigan, where he was born to William H. J. and Frances Christine (Lohmeyer) McPharlin on December 22, 1903. Moving East with his parents as a child, Paul was educated in New York City, first at Townsend Harris High School, and then at Columbia College, from which he was graduated in 1924. He was a student of John Erskine's at Columbia and has also studied under Gordon Craig, the noted English actor and stage designer. Later McPharlin returned to Michigan to work for his M.A. at Wayne University in Detroit (1938), and in 1940 he was awarded a Ph.D. by the University of Michigan. His thesis for this degree was a history of puppets in America since 1524.

Even before he left Columbia McPharlin began working in one of the two professions in which he was later to become prominent—from 1922 to 1928 he was employed in Cleveland and Chicago as a designer in the book and advertising fields. Since 1928 he has also been occupied intermittently with industrial design, part of his work being the making of models for machine production. In 1928, also, he turned to the other of the two major interests to which he has devoted most of his career. That year he became director of the Marionette Fellowship of Evanston, Illinois. Under his leadership this professional company for ten years produced a variety of plays with the stringed actors, plays that were often adapted from such works as Shakespeare's *Taming of the Shrew* and Henry Fielding's *The Tragedy of Tragedies; or, the Life and Death of Tom Thumb the Great.* For seven years, beginning in 1931, he also taught classes at Wayne University in puppetry and bookmaking.

The designer's activity in puppetry has yielded many books, pamphlets, and articles on the subject, besides his productions as manager of a puppet company. "I've collected all possible information on puppets," says McPharlin, who has the largest private library on the subject in the country. Among his friends he counts puppeteers throughout the world. In 1929 *A Repertory of Marionette Plays*, selected and translated by McPharlin, was published. The book, which includes works by Goethe, Bouchor, and Maeterlinck, was well received by the critics as "a useful and interesting book." The April 1929 issue of *Drama* contained McPharlin's article on Anton Aicher's Marionette Theatre in Salzburg, in which he described the work of the Austrian sculptor and puppeteer. Since 1930 he has edited *Puppetry, an International Yearbook* and has also published *Puppetry Imprints*, a series of handbooks. The year 1931 saw the publication of *Puppet Heads and Their Making*, followed by *Animal Marionettes* (1936), which prompted this tribute from one critic: "Mr. McPharlin's puppetry books are not only contributions by an expert to this large and rapidly growing literature, but beautiful in themselves." The artist's article in *New Outlook* in March 1935, entitled "He Still Hangs Around," presented an historical survey of puppetry, which detailed its diverse values. Successfully used for educational and advertising purposes, puppets also have a bright future in television, the author declared. According to McPharlin, "Puppets won't die because of their variety. Let people grow tired of the sort worked by strings, there are always hand-puppets, rod-puppets, shadow figures, and a score of types worked by various means from above, below, or on the stage plane, to be brought forward. Puppets may be tiny enough to be pulled by a baby, or so huge that they must be hoisted by cranes."

In 1936 McPharlin's *Puppets in America* was published, and the next year he organized Puppeteers of America and became its first president. The puppetry specialist toured England and the Continent in 1938, making a detailed study of European puppetry. *Theatre Arts* for July 1941 carried his article, "A Quarter-Century of American Puppetry," which was also a brief historical background of puppetry elsewhere in the world. "European puppeteers first started coming to America in 1524," he wrote, as he proceeded to assess the revival of American puppetry in the past twenty-five years. Emphasizing the wide scope of the medium and its varied utilization by puppet pioneers, he said, "Requiring little space, little money, and not much audience, it allowed them to create exactly as they pleased. They could go cubist or surrealist. They could revive the classics or stage their own scripts: satires, tragedies, combinations of the three-dimensional and the four-dimensional, of the panoramic and the microscopic." On the question of puppetry's worth, the author declared, "Educators have looked upon it as a developer of skills in handicraft, voice-production, social cooperation, and so on. Occupational therapists have liked it as a curative instrument. Psychiatrists have used it for analyzing children. Advertisers have capitalized upon its popular appeal to sugar-coat sales messages." But McPharlin pointed out the danger that "puppetry as entertainment and a minimal form of theater may be neglected," and expressed hope for its future in the work of experimenters.

In the realm of graphic arts, the other sphere in which he is particularly active, McPharlin is well regarded as creative artist and critic. Since 1944 he has been working in New York with the firm of J. Gordon Carr, industrial designer, specializing in typography and illustration. His book *Roman Numerals, Typographic Leaves, and Pointing Hands* was published in 1941 by the Typophiles, an organization which published books solely for the enjoyment of its own members. He has illustrated editions of Coleridge's *Ancient Mariner*, Gilbert and Sullivan's *Mikado*, and Rostand's *Cyrano de Bergerac*. Books designed by him include Poe's *The Raven, and Other Poems* and Franklin's *Satires and Bagatelles*. In October 1942 McPharlin began a series of articles for *Publishers' Weekly* devoted to epic works in the book publishing field, which ran through 1944. Inaugurated while the author was in the Army (he served in the Army Air Forces in 1942-1943), the series dealt with works like Benjamin Franklin's *Cato Major*, the *Nuremberg Chronicle*, and the Nonesuch Press edition of Dante's *Divine Comedy*. McPharlin's feeling for books was noted in his articles: Discussing Tonson's *Caesar*, he wrote, "Each line has tone color, tempo and expression, like a musical phrase or section in a melodic development, played on a particular instrument"; and then, writing of the Cranach *Hamlet*, McPharlin commented: "One likes beautiful books as one likes beautiful women . . . a good plain wife to cook and sew, and a pocket-edition of Shakespeare; a Hollywood beauty to adore from afar, and a Cranach *Hamlet*."

Sauer Studios
PAUL MCPHARLIN

A detailed study by McPharlin called "Dimensions of Printed Line" appeared in the November 1944 issue of *Magazine of Art*. After a brief historical examination of printing the author surveyed the modern scene in the graphic arts field, treating especially the work of Studio Seventeen under Stanley William Hayter '45. Dealing with such media as engraving and illustration, he outlined the new techniques in use. Of the vast sphere of art in the modern world, he stated, "Artists of today see much more than what meets the naked eye. They see with the telescope, the microscope, the spectroscope—with all the enlarged vision of science. They see with the interpretive perception of the psychoanalyst."

Other of McPharlin's activities have also been in the fields of books and art. For three years, 1935-38, he was publisher in Detroit of the Fine Book Circle. In 1941-42 he was State supervisor of the Michigan Art and Craft Project under the WPA. (One deviation from this pattern was a period of war work in Detroit following his discharge from the Army.) He is a member of the American Institute of Graphic Arts and the American Craftsmen and Designers, and is a contributor to such magazines as the *Mask, Players, American Artist, Spur*, the *Colophon*, and *American Printer*. His book *Paper Sculpture and Its Uses* was published in 1945.

Paul McPharlin once wrote that "big fellows have a compensatory fascination for the miniature," which may explain his own pen-

MCPHARLIN, PAUL—*Continued*

chant for puppets. He is more than six feet tall, weighs two hundred pounds, and has gray eyes and red hair. He collects books and as a hobby has done bindings for his own library. "My desire to make things well and beautifully," McPharlin explains, "has resulted in the development of handicraft skills in many crafts from ceramics to wood engraving." He has designed pewterware, textiles, and furniture, and, on a larger scale, a suburban house and a chain of candy stores in Chicago. The artist enjoys gardening and likes to travel. In 1945 he was editing the writings of the late William A. Kittredge, the typographic expert, and was also writing a full historyof puppets in America.

MAGNUSON, WARREN G(RANT) măg′nŭs-ŭn) Apr. 12, 1905- United States Senator from Washington; lawyer

Address: b. c/o Senate Office Bldg., Washington, D.C.; h. Olympic Hotel, Seattle, Wash.

The freshman Senator in Congress, from the state of Washington, is Warren G. Magnuson, who is a leading member of the Democratic bloc of progressives in the upper house. After seven years of service in the House of Representatives, during which he established "an excellent liberal record," Magnuson won a Senatorial seat in November 1944. Once called "a 1000 per cent New Dealer," he has supported the Administration both on the international and domestic fronts. The Western Senator is a veteran of the Second World War, having served as a lieutenant commander with the Pacific Fleet.

Warren Grant Magnuson is a native of the Midwest; he was born in Moorhead, Minnesota, on April 12, 1905. Of Scandinavian parentage, he was orphaned at an early age and adopted by a Swedish family; his parents were William G. and Emma (Anderson) Magnuson. While attending the high school in his native town, he ran a YMCA camp and worked in the fields during the summer. For a brief time he attended the University of North Dakota (1923-24), then for a period traveled through Canada. His Canadian adventures included working with threshing crews and "riding the rods" to Seattle. In that city he worked his way through the University of Washington, receiving his B.A. in 1925, and his LL.B. from the university's law school in 1929. He won admission to the Washington bar that year and began his law practice in Seattle. Magnuson was associated with the firm of Stern and Schermer from 1931 to 1932. In 1932 he served as special prosecutor for King County.

The attorney had first become active in Democratic politics during the Al Smith '44 Presidential campaign of 1928. Five years later he was elected to the State legislature, where he remained for a year, serving at the same time as a member of the State judicial council. According to a publicity pamphlet issued in Seattle, in the course of this legislative session Magnuson "wrote and put through the first unemployment compensation bill in the Nation." He was a delegate to the State Constitutional Convention in 1933 and that year became Assistant United States District Attorney. His next position brought him back to serve King County as prosecuting attorney, having been elected by the greatest majority ever given a candidate for that office. The Democrat was elected to Congress in 1936 and represented the First Washington District, Seattle, in the Seventy-fifth to Seventy-eighth Congresses, being re-elected three times by large majorities.

During his career in the House, Magnuson was generally consistent in his adherence to the policies of the Roosevelt '42 Administration, upholding, for example, most of the win-the-war measures. He voted against repeal of the measures limiting salaries to twenty-five thousand dollars, after taxes; against the anti-strike bill and the anti-subsidy bill; and twice he voted to sustain the Presidential veto, on the commodity credit and tax bills. (However, in 1938, on the issue of conscription, he called for a referendum and subsequently voted against the conscription bill.) From the time he entered Congress he championed the building of a highway joining the western United States and Alaska, working to get Congressional funds for such a project. His proposed measure got as far as the House Foreign Affairs Committee, which in 1938 approved his bill for a road through British Columbia and the Yukon. Magnuson studied the plan in detail, taking a plane trip over the territory in 1939, and thereafter, as chairman of the Alaskan International Highway Commission, he helped survey the terrain of the proposed route, a route he considered superior to that later chosen for the Alcan Highway. In 1940 he conferred with Canadian representatives on the plan, and the following year he toured Alaska. Returning from this trip, he emphasized the danger of Nazi penetration of Alaska through Siberia.

A lieutenant commander in the United States Naval Reserve, Magnuson went on active duty shortly after Pearl Harbor. After eight months with the fleet in the Aleutians and the South Pacific, he returned to the House, where he was subsequently active on the Naval Affairs Committee. When Congress investigated defense measures in the Aleutians in the summer of 1942, he represented the House in a tour of that area. The following year he was chairman of a subcommittee which worked with United States administrative agencies for the establishment of American island bases in the Pacific after the war

Early in 1943 he became chairman of a subcommittee to investigate the shipbuilding industry. In February the Washingtonian was chairman of the House committee that investigated the antilabor story that merchant seamen had refused to unload a ship at Guadalcanal on a Sunday. The committee's report condemned press usage of the story as "not based on fact." The next month the Representative from the Evergreen State took an active part in the drive for passage of the anti-poll tax bill. His name headed the list of the discharge petition to force a House vote on the measure, and it was Magnuson who controlled the bill on the House floor for the Democrats. About this time the Congressman, with a colleague, Representative John Coffee, requested a War Department investigation of alleged Army discrimination against veterans of the Lincoln

Brigade, who had fought on the side of the Loyalists in the Spanish civil war. Despite the evidence presented by the Congressmen, these charges were later denied by Under-Secretary of War Robert P. Patterson '41. Late that year the Magnuson bill repealing the Chinese Exclusion Act was passed. Previously, speaking in favor of the measure, Magnuson had said: "Exclusion has proved one of the most potent weapons the Japanese propaganda machine has had. Putting the Chinese on an equal quota basis will give Chungking a great weapon with which to fight it."

In April 1944, when the Special House Committee on Post-War Military Policy was formed, Magnuson was one of twenty-three Congressmen appointed by Speaker Rayburn '40 to serve with this group. The next month the report of Magnuson's Alaskan International Highway Commission branded the Alcan Highway "a stupendous blunder," while the chairman further charged that the Army and the La Guardia '40 Committee on Joint Defense had neglected to investigate an alternate route before building and had chosen the Alcan route "solely because it will help the Canadian Pacific Railroad."

In the 1944 elections Magnuson ran against Lieutenant Colonel Harry M. Cain for the Senatorial seat vacated by Homer T. Bone. In the course of the campaign for the reelection of Roosevelt, the Western Democrat, in a radio interview in September, delivered a "blistering" attack on Governor Thomas E. Dewey's '44 foreign policy statements and reviewed the record of Republicans in Congress. During this period he also signified his endorsement of a constitutional amendment providing for the ratification of treaties by a majority of the Senate. Magnuson won a decisive victory at the polls in November, and the following month Governor Langlie of Washington appointed him to the unexpired term of Senator Bone in order to place Magnuson ahead of other new Senators in seniority for committee appointments.

Shortly after taking his seat in the upper house, Magnuson cast his vote in favor of Henry Wallace '40 for Secretary of Commerce and Aubrey Williams '40 for Rural Electrification Administration head. In April, during a probe of the light metals industry sparked by the Alcoa case, he called for an investigation of all contracts negotiated by the RFC under the administration of Jesse Jones '40. Later Magnuson was on the bipartisan steering committee which worked, unsuccessfully, for passage of the anti-poll tax bill. In July he won applause from the Senate galleries when he interrupted a speech by Senator Burton K. Wheeler '40, who had called for a definition of surrender terms to Japan. Magnuson declared that the quickest way to defeat Japan was to "say that unconditional surrender means just that."

In late July the Democrat joined his Republican colleague Senator Joseph Ball '43 in sharp criticism of State Department policy in Spain and Argentina. Participating in a broadcast of NBC's *University of the Air* series, the Senators labeled the governments of these countries "clearly Fascist." "This bush league Axis ought to be cleaned up—now," Magnuson said, declaring that the State Department had followed a policy of appeasement in Spain since the Spanish civil war, a policy that was "a mistake from the beginning." Voicing blunt anti-Franco '42 sentiments, both legislators urged American aid to the democratic forces of Spain and Argentina, and the breaking of diplomatic relations with those countries. On July 19 Magnuson introduced a bill providing for the establishment of a National Research Foundation and effecting the program previously suggested by the Office of Scientific Research and Development. Senator Kilgore '43, who had presented a similar measure, and Magnuson met with President Truman '45 in August to discuss these measures for Federal support of scientific research. Joint hearings on the combined bills began in October. Such leading scientists as Irving Langmuir '40 and Vannevar Bush '40 the National Association of Manufacturers, and the American Medical Association argued in favor of the operational plan proposed in Magnuson's bill, which would vest control of the new agency in a board of nine unsalaried members empowered to elect an administrator to carry out research projects. President Truman was among those who endorsed the Kilgore bill, which called for control by a single administrator, in consultation with an advisory board of scientists and government officials; another section of the bill provided that any invention, discovery, or patent rights produced in the course of Federally financed research or development become the property of the United States and would be generally available to all without royalty payments. The Magnuson bill lacks a patent policy.

WARREN G. MAGNUSON

Washington's new Senator has appeared on several radio programs, discussing domestic and international issues. Before the war ended he participated in a radio forum on Federal unemployment compensation during reconversion, stating, "The war worker is on the job because the Federal Government is waging war and he is under orders, just as the soldier is. We have already assumed the duty of protecting industry and property and the man in

MAGNUSON, WARREN G.—*Continued*

the service—surely the duty of the Federal Government extends to the war workers." In August 1945, on *America's Town Meeting*, he urged United States retention of Pacific island bases. When the atomic bomb was first used, Magnuson expressed what is believed to be the opinion of many statesmen. Commenting on the revolutionary character of the new weapon, he declared: "Either we must persuade all other powers . . . to institute true and universal democratic rights, or we must at once begin the race to win the Third World War—the war that would destroy every building above the surface of the earth and put us all into caves. Free people don't want wars. If they know what is going on and have the power, they will make their governments behave."

In 1945 Magnuson was a member of the Senate Committees on Commerce, Interoceanic Canals, Naval Affairs, and Territories and Insular Affairs. He began conducting a complete study of the postwar defense structure during the summer.

Measuring five feet eight inches in height and weighing one hundred and seventy pounds, the bachelor legislator has blue eyes, blond hair, and a "handsome Scandinavian face." His outdoor recreations are fishing and hunting, and he likes to collect books. He is a member of Theta Chi and a Fellow of the American Institute of Political Science. An Elk, Eagle, and a Moose, he also belongs to the Washington Athletic Club of Seattle; and he is a member of the Washington State and American Bar Associations. Popular with his constituents, Senator Magnuson is reported to have once donned kilts and marched down to Victory Square to greet a group of visiting bagpipers from a Vancouver shipyard.

MARTIN, EDWARD Sept. 18, 1879- Governor of Pennsylvania

Address: b. State Capitol, Harrisburg; h. 147 LeMoyne Ave., Washington, Pa.

Edward Martin, Governor of Pennsylvania since 1942, has had a long career, as soldier, lawyer, banker, and politician. As a soldier he has served in five wars; his business associations have been wide and varied; and his political life began in 1925. During the 1944 Presidential campaign he played an active role in Republican national politics—even being mentioned at various times as a possible candidate for the offices of both President and Vice-President—and he has been elected chairman of the National Conference of Governors for 1946.

The son of Joseph T. and Hannah M. (Bristor) Martin, Edward Martin was born on September 18, 1879, in the Pennsylvania township of Washington, in Greene County. At the outbreak of the Spanish-American War, Martin was a student at Waynesburg College in his home state. He left school to enlist in the Army, and, as a private and later a corporal, he served with the Tenth Pennsylvania Volunteer Infantry in the Philippines, both in the Spanish-American War and in the Philippine Insurrection. In August 1899 the nineteen-year-old sergeant was mustered out, but five months afterward he joined the Pennsylvania National Guard as a sergeant.

Martin returned to college at the end of the war and in 1901 he received his B.A. degree. Four years later he was admitted to the State bar, at which time he set up practice as a Waynesburg lawyer. Martin had meanwhile continued to serve with the National Guard. He received his commission as a first lieutenant in 1901, was made a captain in 1905, and a major in 1910. Six years later, at the time the expedition was dispatched to Mexico after Villa, Martin was assigned to border duty.

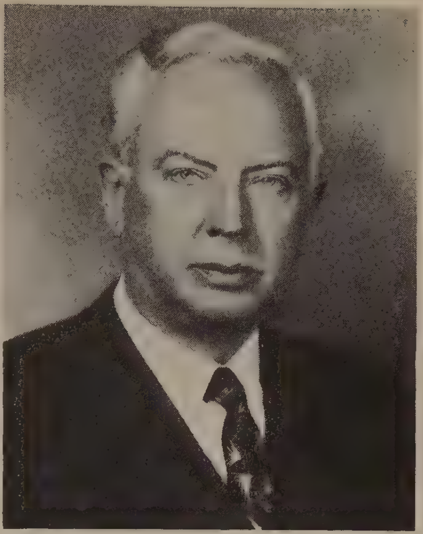
When the United States entered the World War in 1917, Martin went to France as major, subsequently serving with the 109th and 110th Regiments. In September 1918 he was promoted to lieutenant colonel, and before the war ended he was decorated four times. He received the Distinguished Service Cross, for commanding an inexperienced battalion in an attack against a strongly held position. ". . . advancing with the front line, [he] raised the morale of officers and men by his coolness under heavy fire and utter disregard for personal danger." His citation for the Oak Leaf Cluster read: ". . . extraordinary heroism in action near Courmont, France, July 30, 1918. Although painfully wounded when regimental headquarters was destroyed by shell fire, he went with a battalion commander and directed the successful attack against a strong enemy position, remaining in command of the regiment until its relief." He was also awarded a Purple Heart with an Oak Leaf Cluster. Two years after the end of the war, Martin was promoted to a full colonel and placed on the Initial General Staff Eligibility List; in August 1922 he was raised to brigadier general.

In June 1939, just before war began again in Europe, Martin was made a major general and given command of the Twenty-eighth Division of the Pennsylvania National Guard. In 1941 the division was federalized and sent on maneuvers in the South; for his command of the unit at this time, Martin was cited by the Second Army Corps. Early the next year, having been relieved of his command because of his age, the sixty-two-year-old general was assigned to the headquarters of the Fifth Corps Area, at Fort Hayes, Ohio. In April he was placed on the Army's inactive list. (He has written a history of the Twenty-eighth Division.)

In peace years Martin had served as director or president-director of several companies—Washington County Fire Insurance Company, Dunn-Mar Oil and Gas Company, Chartiers Discount Company, and Citizens National Bank of Washington (Pennsylvania)—and in 1925 he entered politics. His first political position was that of auditor-general of Pennsylvania, a post he held for four years, and then State treasurer for four years. During the years between 1928 and 1934 he was the chairman of the Republican State Committee of Pennsylvania. From 1939 until 1943 he was adjutant general of Pennsylvania except for the period between February 17, 1941, and April 1, 1942, when he was in military service.

Immediately after his release from the Army in 1942 Martin was offered the Republican nomination for governor by the political machine of Joseph Newton Pew, Jr. '41, and a former Pennsylvania Senator, Joseph R. Grundy. Campaign posters showed Martin wearing his uniform, and his platform was based on the argument that Pennsylvania needed a governor familiar with "the terror and tumult of war." In the Republican primaries, with a majority of 94,000 votes, he sent Senator James J. Davis down to defeat. In November he was again the victor, defeating Democrat F. Clair Ross for the governorship.

As Governor, Martin has remained, for the most part, a loyal Republican. During the 1944 Presidential campaign he was among the party leaders who formed the platform for the Republican's candidate, Thomas E. Dewey '44. He served on the committee, headed by Senator Arthur Vandenberg '40, which introduced the foreign policy resolution at the Republican Governors' Conference at Mackinac Island in 1943. The resolution, which was later incorporated into the party platform, approved "responsible participation by the United States in a postwar cooperative organization among sovereign nations to prevent military aggression and to attain permanent peace with organized justice in a free world." It was one of the few points raised on which all Republicans, isolationist and internationalist, could agree, since its loose terminology was seen as permitting a wide variety of interpretations. (In July 1945, at the next Governors' Conference on Mackinac Island, the World Charter was endorsed at the urging of Commander Harold Stassen '40.) Martin campaigned vigorously for Dewey, declaring that a young man should now be elected to the White House. He denounced Roosevelt '42 as being unprepared for and mismanaging the war, and maintained that the United States would win the war in spite of President Roosevelt's methods, not because of them. Earlier that year Martin himself was criticized for extravagance in his capacity as host to the Governors' Conferenec in Hershey, at a time when wartime conservation was being stressed.



EDWARD MARTIN

In 1943 Governor Dewey urged the five states bordering on New York to support the Office of Price Administration with State legislation in order to keep black markets from flourishing. According to Governor Martin, Pennsylvania would have liked to have cooperated, but he was not sure of the procedure. In April 1944 Governor Martin advocated an increase of fifty cents a barrel in the cost of oil "to stimulate production and keep the industry healthy by insuring necessary good wages to employees."

In his annual message to the Pennsylvania State Legislature, in January 1945, Governor Martin surprised both his political enemies and friends. He broke with party tradition by demanding legislation providing larger unemployment compensation and liberalized compensations for occupational diseases. He recommended larger appropriations for safety inspections of mines and factories, to give Penn-

MARTIN, EDWARD—*Continued*

sylvania workers "as safe a place to work as possible." He advocated new low-cost housing and denounced racial discrimination as un-American. In September, however, he again stood with his party when he opposed the Kilgore['43] bill, which would have raised total unemployment compensation benefits to a maximum of twenty-five dollars per week for twenty-six weeks, by supplementary Federal payments. In addition, it would have given travel payments to unemployed war workers to enable them to return to their homes. Governor Martin announced that he was opposed to "any bill or plan designed to federalize the administration of unemployment compensation." He also stated that he was in favor of full employment, not "coddling," for returning veterans, and also for much less "interference" by Washington in State affairs.

The tall, white-haired Governor was married to Charity Scott, a Waynesburg girl, in December 1908. They have two children, Edward and Mary (Mrs. James B. W. Murphy). Martin holds numerous honorary degrees: LL.D. degrees from Washington and Jefferson College (1938), the University of Pittsburgh (1941), Temple University, Pennsylvania Military College, Villanova College, Drexel Institute of Technology (all 1943), Gettysburg College (1944), and Grove City College, Lebanon Valley College, and Westminster College (all in 1945). He has a Doctor of Military Science degree from Waynesburg College (1940), of which he is a trustee; a Doctor of Humane Letters from the Hahnemann Medical College and the Hospital of Philadelphia (both in 1945); and in 1937 he was awarded the Pennsylvania Reilly Medal for his military services.

Among the veterans' organizations to which he belongs are the American Legion, the Veterans of Foreign Wars, and the Legion of Valor. Because he saw service before the First World War, he is a member of the Military Order of the Carabao and the Spanish-American War Veterans. Since the beginning of his forty-four-year career as a soldier, he has been collecting military books. This library, which consists of nearly six hundred volumes, is divided into three classifications: basic textbooks on various branches of service, histories of military campaigns, and biographies. One part of the collection is housed in his home, the other in the library of the Indiantown Gap Military Reservation, where the books were used by servicemen during the Second World War. Martin belongs to the Elks and is a thirty-third-degree Mason. He is an elder in the Presbyterian Church, a member of the board of directors of the Department of Church Cooperation and the Union of the Presbyterian Church in the United States, and vice-president and director of the Pennsylvania State Sabbath School.

MARTINELLI, GIOVANNI (jō-van'nē) Oct. 22, 1885- Singer

Address: b. c/o Michael DePace, 1270 Sixth Ave., New York City

The vigorous and versatile Giovanni Martinelli of the Metropolitan Opera Company has not only played a record number of seasons but is regarded as one of the best-loved Metropolitan tenors of all time. This singer, whose snowy hair "seems to rise by sheer electricity" from his temples, made his first appearance at the Metropolitan in 1913. He has sung more than fifty roles in the past thirty-two seasons. Many people in today's opera audiences have never known a time when the Italian tenor was not singing in New York.

Giovanni Martinelli was born in Montagnana (near Padua), Italy, on October 22, 1885, the son of Antonio and Lucia (Bellini) Martinelli. His father was a cabinetmaker; and Giovanni, the eldest of fourteen children, was ambitious to become a master craftsman like his father. He sang as a boy in the village church choir—but "his thirteen brothers and sisters sang, too, and so, for that matter, did most of the other Montagnana villagers." To be able to sing wasn't enough to distinguish a boy in a town of music-lovers. But Giovanni could also play the clarinet; and at twelve he became clarinetist in the town band.

At the age of twenty Martinelli was drafted for three years of military service. It is said he likes to reminisce about those years in the army: "My ability to play the clarinet," he recalls, "was the means of procuring [for] me a life of comparative ease. I applied for membership in the regimental band and was accepted. Bandsmen had the privilege of officers, so I was very well off. One day some of my companions and I were spending our recreation time together singing and joking. I was one of the most enthusiastic vocalists, and had just finished a selection, sung fortissimo, when our bandmaster came out into the enclosure where we were. . . .I thought I had been guilty of some breach of discipline. Imagine how the world changed when instead . . . the bandmaster spoke the magic words: 'You have a wonderful voice. You should study.' . . .That was all that was needed to fire me with ambition. The bandmaster and my colonel were good friends. The latter gave me permission to go with the bandmaster to the homes of the prominent families of Piedmont to sing and, as they were pleased, I was granted leave to go to Milan for an audition. There . . . I was advised to take lessons." Young Martinelli's friends then proceeded not only to win his father's permission to let him study, but to help him secure wealthy patronage. When his military service ended, the singer therefore began his lessons.

It was in December 1910 that Martinelli made his concert debut in Rossini's *Stabat Mater.* Two weeks later his opera debut took place in a Milan production of Verdi's *Ernani.* According to one account, the singer "dropped his sword and flubbed his lines" in his stage role. But he had a voice. Furthermore, Puccini was in the audience and engaged him for the European première of his *The Girl of the Golden West* with Toscanini '42 conducting, in Rome in 1911. Following this came a rapid succession of engagements in Milan, Monte Carlo, Genoa, Naples, Turin, Budapest, and Brussels. London first heard the new tenor at Covent Garden in 1912. There he sang in *Francesca da Rimini* and *The Jewels of the Madonna.* Since then Martinelli has been one of the most popular Italian tenors with the English public: they have frequently requested his return, and in the spring of 1937 gave him the honor of opening the coronation opera season in the title role of *Otello.* (In 1913, just before coming to America, Giovanni Martinelli was married to Adele Previtali. They have three children: Bettina [Mrs. Mario Libotte], Antonio, and Giovanna.)

The young tenor, not yet thirty, was almost unknown to the American music world, and no stir heralded his debut at the Metropolitan in a performance of *La Bohème* on November 20, 1913. When the curtain rose the applause for Rodolfo was "only perfunctory." The new tenor was nervous and forced his voice to be heard above the orchestra. But his performance became increasingly moving, and at the end of the third act he was greeted with tumultuous applause. Critical opinion was divided, however, ranging from the unqualified commendation for the voice of "a real lyric tenor, intense and peculiarly vital in timbre," to the regret that "his strongest conviction seemed to be that force meant feeling." But it was in general agreed that the Metropolitan had added a valuable member to its company, and it was also predicted that the newcomer would win a place for himself.

In the course of time Giovanni Martinelli came to be regarded as the best all-round Italian tenor on the Metropolitan roster. His repertoire included a great number of roles, some of the best-known being *Aïda, Carmen, Samson et Dalila, Tosca, Faust, Rigoletto, La Juive, Pagliacci,* and *Otello.* The two extremes in his repertoire were the lyrical role of Riccardo in Verdi's *A Masked Ball*—and the much heavier title role in *Otello.* He has been the incomparable Rhadames of more than three hundred and fifty performances of *Aïda* alone; but he did not attempt the role of Otello until 1937.

On March 20, 1938, his twenty-fifth consecutive season as a Metropolitan singer was celebrated by a gala performance. Eighteen of the leading singers of the Metropolitan participated, and Martinelli himself sang three important arias from *La Bohème, La Juive,* and *Otello.* It was on the occasion of this jubilee celebration that the late Metropolitan president, Paul D. Cravath, remarking on the singer's elasticity of temperament, his strength and vigor, said that the fifty-two-year-old Martinelli had surely "bathed in the Fountain of Youth." In 1939, in the Chicago opera season, Martinelli satisfied one of his most cherished ambitions—to sing a major Wagnerian role. This he did, in *Tristan und Isolde.*

GIOVANNI MARTINELLI

The year 1940, because of the war, was a critical one for the Metropolitan Opera Company, in so far as its Italian singers were concerned. Several who had been on vacation in Italy, or otherwise engaged abroad, had had their passports canceled. Martinelli, however, was protected by his United States citizenship; and he was thus in New York in October of that year to sign his twenty-eighth consecutive contract, so "establishing a new record for longevity of service at the House for a first-string singer." The season proved to be one of the Metropolitan's most successful in recent years. Martinelli was one of the three top box-office stars, the other two being Kirsten Flagstad and Lily Pons '44.

On September 17, 1941, Martinelli was appointed artistic director of the Chicago Opera Company for the 1941 season, to work with Fortune Gallo as general director. R. H. McCormick, chairman of the Chicago Opera, said that the new assignment would not interfere with Martinelli's own singing career, that he would sing with the Chicago company, as well as at the New York Metropolitan, and also make a nationwide concert tour. Most of the repertoire had already been chosen, and most of the company assembled. But Martinelli had to make final supervision of the casts and find last-minute solutions of emergencies. It is evident that Martinelli held those singers under his direction to a rather strict code. According to him, a singer must be familiar not only with his role, but with the language, the libretto, and the psychology of the part he portrays, and the tradition, also, of playing the part. "I am eager to find singers who are also actors, who feel their parts with intense sincerity, and have the ability to stimulate such feeling in others through a wholehearted giving of self; who are willing to begin at the bottom in order to ascend to the top."

(Continued next page)

MARTINELLI, GIOVANNI—*Continued*

Regarding opera in general, Martinelli has said that in large cosmopolitan cities opera may be safely given in its original language. But "in small cities of native, homogeneous population, opera should be given, I believe, in the language of the audience." Opera will be further improved, he said, when the public realizes that "voices" and "names" are not enough to make characters live. "The first requisite for operatic work is not a name, but a dramatic ability." Martinelli believes that one great handicap to the American artist is lack in the United States of sufficient opera companies in which a singer may acquire practice in public.

In February 1943 Martinelli began, with Verdi's *Il Trovatore*, his thirtieth consecutive year as a Metropolitan artist. According to the New York *World-Telegram*, for the past couple of years the noted tenor's voice had not been "all that he himself might have wanted it to be, let alone the opinions of others. But, like the experienced trouper that he is, he stayed with the music, pacing himself wonderfully well. What he lacked in tonal purity or volume he made up in finesse and operatic 'savvy.' . . .Not the least effective side of his impersonation was his stage deportment, his adherence to the tenents of the role at all times." In 1945 Martinelli sang Manrico in *Il Trovatore* and Polione in *Norma* in two of a series of farewell appearances.

Martinelli's skill and versatility throughout his long career have been accompanied by unusual good health and good nature. In his fifty-sixth year, when he was director of the Chicago Opera Company, he also learned to drive a car. He went at the latter venture with the same energy he puts into learning a new role. "Within a few months of his first lessons at the wheel of the Buick he rolled up seventeen thousand miles." Martinelli has the actor's usual superstition. His friends say that there is a backstage ritual to be followed by him before every operatic performance. There is a little holy relic that must be saluted; and photographs of his wife and three children must "be placed carefully on the dressing-room table, and a kiss given each."

Martinelli's equanimity and cheerfulness account for his popularity. He is not only the "youngest, happiest, most ebullient performer to bow at any curtain," but the gayest figure at the speaker's table, the man with the brightest smile at a party. He is a gourmet and makes a hobby of cooking: he "rewards a properly appreciative guest with his own prized recipe for a *risotto*, or for spaghetti done after a favorite method of his old friend Enrico Caruso." It is said, too, that Martinelli has had amazingly few disagreements with his Metropolitan fellow artists. The most memorable was an intense but short-lived quarrel with the great Scotti over the exact amount of salt required to bring a spaghetti sauce to perfection.

MATTHEWS, H(ARRISON) FREEMAN May 26, 1899- United States Government official

Address: b. c/o Department of State, Washington, D. C.; h. 3224 Woodlawn Dr., N.W., Washington, D.C.

In the service of the United States Department of State since 1923, H. Freeman Matthews is one of those men who have risen steadily if unsensationally in their chosen field. His appointment as director of the State Department's Office of European Affairs on December 20, 1944, occasioned no surprise among his confrères; nor did fanfares of publicity attend his appointment. It was to be expected in the natural course of events. Matthews was then forty-five, but in terms of his position he was considered one of the more promising young men in public life.

Harrison Freeman Matthews was born in Baltimore, Maryland, on May 26, 1899. The son of Henry Clay and Bertha (Freeman) Matthews, he attended the Gilman Country School, Princeton University (B.A. 1921, M.A. 1922), and l'Ecole Libre des Sciences Politiques in Paris in 1922-23.

Matthews began his career as a Foreign Service officer on December 12, 1923, as secretary of embassy or legation, class four, assigned to the State Department. In February 1924, he was sent to Budapest, where on July 1 of the same year he attained the rank of third secretary. A little over two years later, on September 2, 1926, he became third secretary at Bogotá. On August 19, 1929, he was reassigned to Washington, appointed assistant chief of the Division of Latin American Affairs on November 1, 1930, and sent on special detail to El Salvador the following year. On October 4, 1933, he was appointed second secretary of the Embassy at Havana, and on November 27 was made first secretary.

After his six and a half years of experience in Latin American affairs, Matthews returned to the European scene. On July 13, 1937, he was made first secretary at Paris, and a month later consul, combining his duties as consul with those of first secretary after April 21, 1938.

April 4, 1939, saw him as first secretary at Madrid. He returned to Paris as first secretary on July 1, 1939, then was sent to Vichy in 1940. He went to London as counselor of the Embassy late in 1941, and in 1942 was made counselor with rank of Minister. In August of 1943 he was made chief of the Division of European Affairs in the Department of State. In January 1944 he became deputy director, and in December of the same year director of the Office of European Affairs.

Thus Matthews has had experience in both Latin American and European affairs. Furthermore, he has served his Government in various embassies at times when relations of the United States and those countries were anything but smooth. He has seen diplomatic relations at their most complicated. Much still remains to be ironed out between the United States and Latin America, Spain, and France, as a review of United States relations with these countries before and during the war reveals. Logically, Matthews would seem to be one of the men fitted by interest and experience to help with the improvement of those relations. The United States-Vichy relations during the latter half of 1940 (when Matthews was on duty in Vichy) were more complicated than the general public suspected at the time. In 1943 the State Department published six documents covering the period from June 17 to December 20, 1940. (Matthews was at Vichy from June 10, 1940, until October of 1941.) The State Department documents reveal that a diplomatic breach between the United States Government and that of Marshal Pétain '40 almost occurred in November 1940, thirteen months before Pearl Harbor. The documents included instructions from Secretary of State Cordell Hull '40 to Anthony J. Drexel Biddle, Jr., '41 the American Ambassador then serving with the French Government at Bordeaux, and to Matthews, as well as their replies. Also included among the documents was one containing President Roosevelt's '42 instructions to Admiral William D. Leahy '41 as he was assuming his duties as Ambassador to France.

On June 17, 1940, with the fall of France, Hull instructed Biddle to obtain assurances that the French fleet would not fall into German hands. If it did, France was warned, she would lose the friendship and good will of Americans and risk the loss of their help in restoring her independence and autonomy. Ambassador Biddle obtained the required assurances from Paul Baudoin, the French Foreign Minister. Later, on October 25, after Dakar and other British naval operations, another warning was sent. President Roosevelt gave a note to Ambassador Gaston Henry-Haye '40 and sent one to Marshal Pétain through Matthews, again warning about the French fleet, this time with respect to its possible use against the British. The message also warned that if France provided assistance to Germany she would not have American influence in retaining her overseas possessions. In his reply to this message Marshal Pétain showed resentment, but gave his word once more that the French fleet would "never be surrendered."

Obviously the situation was one of the utmost delicacy. The United States was suspicious—as events later proved, justifiably so—not only of the intentions of Pierre Laval '40, but also of the intentions of the Vichy Government as a whole. That Pétain and the late Admiral Jean Darlan '41, the French Navy Minister, kept their word and did not permit the French fleet to fall into the hands of the Axis powers was a victory for the United States, a victory which must have been due, at least in part, to the competence of the American diplomatic corps in Vichy.

H. FREEMAN MATTHEWS

Matthews first came to the foreground at the time of his appointment as chief of the European Division of the State Department in 1943 (succeeding Ray Atherton, who became minister to Canada). The New York *Herald Tribune* styled him a "career diplomat" who had first come into the limelight in the autumn of 1940, after the fall of France, "when he was Chargé d'Affaires of the American Embassy in Vichy during the interregnum between the departure of Ambassador William C. Bullitt '40 for the United States and the arrival of Admiral William D. Leahy as Ambassador in January 1941. Even after the advent of Admiral Leahy," continues the *Herald Tribune*, "Mr. Matthews was an important figure in American diplomatic circles in Vichy because he always accompanied the American Ambassador on his calls on Marshal Henri Pétain, Admiral Jean Darlan, and other leading Vichy officials. Admiral Leahy spoke little French, and it was up to Mr. Matthews to act as interpreter." *PM* has called Matthews "one of the younger men of the State Department who have been rising to the top in recent years," adding, "he is regarded as an extremely capable man, rather on the conservative side but by no means a reactionary. Ambassador Winant '41 is understood to have thought highly of him."

In March 1944 Edward Stettinius, Jr., '40 then Under-Secretary of State, made a trip to London for high-policy talks with the British Government. Matthews was one of Stettinius' aides on this mission. The others were Wallace S. Murray, director of the Office of Near-Eastern and African Affairs; Isaiah Bowman '45, president of Johns Hopkins University

MATTHEWS, H. FREEMAN—*Continued*
and geographer and postwar planner; John Lee Pratt, consultant on commercial affairs and former Lend-Lease official; and Robert J. Lynch, secretary to Stettinius and executive secretary of the mission.

On April 26 it was announced that the work of the mission was almost over. The members left London "satisfied that their visit, while it had settled nothing finally, had helped to bring nearer to realization that complete unity of action among the big powers that the conferences at Moscow, Teheran, and Cairo had foreshadowed." The talks resulted in no final decisions but did help clear away many points on which there had been misunderstanding. While the mission was in London there arose the urgent problem of how to deal with neutral governments which persisted in trading with the enemy. In a note to Sweden, Britain and the United States appealed to that country to stop shipping ball bearings to the Nazis. Also, an appeal was made to Spain that she stop exporting wolfram to Germany. (Both of those countries subsequently stopped most of the shipments of these materials to Germany.)

In July 1945 Matthews accompanied President Truman to the Potsdam conference and in December he attended the Moscow meeting of the Big Three Ministers together with Secretary of State Byrnes. It is said that Matthews, as chief of the Division of European Affairs, was an important figure at these meetings.

Matthews was married on September 15, 1925, to Elizabeth Luke. He has two sons, H. Freeman Matthews, Jr., and Thomas Luke Matthews. His church affiliation is Presbyterian. Among his recreations he lists tennis and mountain climbing.

MAULDIN, BILL Oct. 29, 1921- Cartoonist

Address: b. c/o Henry Holt & Co., 257 Fourth Ave., New York City

Up Front With Mauldin, a series of realistic sketches of two war-weary, unkempt GI's of the Second World War, has been compared to Bruce Bairnsfather's *The Better 'Ole* of the First World War. The creator of this now famous pair of infantrymen, Joe and Willie, is Bill Mauldin from Arizona who understands the grim humor of combat troops because he himself has been in combat. His cartoon series, which appeared in the pages of the Army overseas newspaper the *Stars and Stripes*, and was syndicated in seventy-nine United States daily papers. Mauldin was awarded the Pulitzer Prize in 1945 "for distinguished service as a cartoonist."

William Henry Mauldin has lived his short life "the hard way." He was born on October 29, 1921, in Mountain Park, New Mexico, and seems to have spent part of his boyhood there and the rest in Phoenix, Arizona. His father, Sidney Mauldin, had been badly gassed in the First World War and afterward "found the going tough." He tried dry farming on his homestead near Phoenix, worked as a hired hand, then for a while was a tire-changer at a bus station in Phoenix. As a boy Bill had rickets and thus was forced to spend most of his sickly, lonesome childhood in bed, looking out of the window and watching the other children at play. The countless pictures that he drew of himself riding ponies in cowboy chaps and ten-gallon hats, or shoveling coal into a locomotive firebox, expressed his childhood dreams. When he was graduated from grammar school as valedictorian of his class, however, he finally received the horse for which he had longed.

In 1938 the parents of the "scrawny, cocky" seventeen-year-old artist were divorced, and he and his brother Sidney went back to Phoenix from New Mexico, where they had been living. There Bill joined the ROTC and was made a corporal. The first public recognition of his art had come while he was in high school and had sold his first drawing for ten dollars, to the La Luz Pottery Company in New Mexico. When he sold his next drawing he invested the five dollars he had received for it as a down payment on a correspondence course in cartooning. Then he initiated a wolf-from-the-door routine which was to continue for many months. He painted posters, he "even painted the white sidewalls of aristocratic tires," he told Frederick Painton in 1945. But because of this extracurricular work, he found himself a half-point short at graduation, and did not receive his diploma.

Determined to be a professional cartoonist, Mauldin wanted formal training. From "Grandma Callie Bemis," his maternal grandmother, he procured the three hundred dollars necessary to enter the Chicago Academy of Fine Arts. Again he worked his way—washing dishes, painting signs, illustrating menus. (He thinks that the permanent impairment of his eyesight began at this time, for he would work all day and often most of the night.) After the period of work and study in Chicago he returned to Phoenix in his usual financial condition—"broke." His next attempt at a money-raising venture was to draw "gag" sketches for national magazines; he drew many hundreds in the course of a year, sending them out regularly and as regularly getting them back. But he sold some cartoons to Arizona Highways; then, finding himself in the midst of the 1940 gubernatorial campaign, he helped a local political cartoonist with sketches for "smear posters"; he got twenty-five dollars a sketch, which paid for his room and meals. But, according to *Life* Magazine, he almost got into trouble when it was discovered that he was drawing similar posters for the rival aspirants for office. In September he enlisted in the Arizona National Guard. Volunteers to this organization did not have to pass a physical examination, but, ironically, five days after Mauldin enlisted, the Arizona Guard was federalized, and the young cartoonist, who "couldn't have passed the first doctor," found himself in the Army.

"I was in this man's army when it was an infant," Mauldin says, "and we kinda grew up together—me being only eighteen. All I know —grown up—is Army life." He began his infantry training with the Forty-fifth Division at Fort Sill, Oklahoma—drilling, patrolling, marching all day and spending most of the night in the division *News* office drawing pictures for the paper. Later these *News* cartoons were printed by the Oklahoma University Press in a volume called *News of the 45th.*

While at Camp Barkeley, in Texas, the young soldier-artist met Norma Jean Humphries from Toyah (Texas), an eighteen-year-old junior at Hardin-Simmons University. His courtship interrupted her academic career as well as a romance with a Royal Canadian Air Force suitor. When she became engaged to Mauldin, the artist drew a cartoon for the *Daily Oklahoman* for the down payment on a diamond ring costing twenty-seven dollars and fifty cents. The young couple were married in February 1942, and after their wedding Bill did more art work for the *Oklahoman* to add to his soldier's pay.

With his division Mauldin moved about the country: Camp Barkeley, Fort Devans, Pine Camp, Camp Pickett, and Camp Patrick Henry were stops along the way to Italy. "There was little home life for the bride and the boy trying to be a soldier," writes Painton, "but he could still draw cartoons of doughboys pitching pup tents beside the bus terminal and setting up housekeeping while waiting for room on the bus." His second book of cartoons, *Mud, Mules and Mountains* (1943), which was published by the *Army Times*, eased the Mauldin's financial burden when their son, Bruce Patrick was born, shortly after the artist's arrival in Sicily. *Sicily Sketchbook*, printed in a shop in Palermo, brought in eighteen hundred dollars more. (Seventeen thousand copies of the book were bought by members of the Forty-fifth Division alone.)

After Mauldin became a sergeant the editors of the *Stars and Stripes* arranged to have him transferred to their staff. On July 13, 1943, three days after Sicilian D-Day, they had brought out the first edition of an American Army newspaper to be printed on European soil. Several weeks later Mauldin was in the hospital with sandfly fever; when he was discharged he found that some of the troops had already left Sicily for Salerno. Not wanting to be left behind, he left the replacement center unceremoniously and caught up with his division just as the last boats were leaving for Salerno.

At Salerno the cartoonist was wounded and awarded the Purple Heart. During that hard winter of 1943-44 he traveled between the two bitterest fronts of the Italian campaign, Cassino and Anzio, seeing tired men of the Fifth Army go back day after day with courage and endurance to "the dogged slugging that finally beat the best the Germans had." When his old outfit landed in France, Mauldin stowed away with his jeep aboard an LST and went with them. After two months in France he returned to Italy, and after that he made frequent trips to the Fifth Army front.

Mauldin says that it is difficult for him to remember just how or when his cartoon character Joe was created. "He didn't appear suddenly," he wrote from Italy for *Life* Magazine in 1944, "and we were never formally introduced. He hung around for years, and I suspect that, like Topsy, he just grew." In 1940, he recalls, when he was a private at Fort Sill, Oklahoma, he used to give expression to his rebellious feelings under Army discipline in cartoons for the division newspaper. After a year "the kind gods with brass on their shoulders" decided that the sketches were a morale factor, and Mauldin was given a full-time job on the paper, in which he continued "hammering blows at the Army system." "It never fell," comments the young artist, "but sometimes I felt convinced it was tottering and was content."

SGT. BILL MAULDIN

Joe, in those early days, was a youthful, clean-shaven anonymous recruit. When he got to Sicily he acquired the name Joe because Sicilian children called out to the Americans as they pushed through their little villages, "Hey, Joe! Candy? Cigarette?" (Mauldin has pointed out that "GI" is an authentic soldierism, except in combination with "Joe"; "GI Joe" is a strictly civilian expression.) With the acquisition of a name and some campaign experience, Joe and his comrades began to age. After the fighting in Italy their metamorphosis was complete; they had become the tired, dirty, dull-eyed, unshaven foot soldiers of the current cartoons. To the civilians who complain that they look more like hobos than like any familiar conception of the American soldier, and to women who write protesting that "our boys don't look like the way you draw them—bearded and horrible looking," Bill Mauldin answers, "I draw our guys like that because that's the way they are." "I was eighteen when I joined the Army," he explains in *Life*. "I knew a lot of these kids then. Now, after they've been through a couple of campaigns, after being in the line for weeks, they're old men. They've aged ten or fifteen years, have beards, their eyes have bags underneath, and they wear a dopey expression like they need a lot of sleep. . . .The poor guys have changed so that I hardly recognize them."

"The foot soldier is unhappy most of the time," write two Mauldin defenders in *Life.*

MAULDIN, BILL—*Continued*

"Saddled with the grimmest, most wretched job in the Army, he is tired, wet, and scared most of the time. . . .He feels friendless and forgotten." This misery of the infantryman is expressed in one of the Mauldin sketches depicting a little dog shivering in the rain outside a cave where several doughboys have sought shelter. "Let him come it," says one of the men from the darkness inside. "I wanna see a critter I kin feel sorry for." "In these hollow-eyed, unshaven infantry characters," writes Frederick Painton of Mauldin's soldiers, he has "immortalized the misery, the grandeur, and the godlike patience—as well as the grim humor—of the front-line fighting man." The late Ernie Pyle '41, too, has defended his artistic counterpart in Italy, captioning a picture release of a weary soldier on Okinawa with, "So you at home think Cartoonist Bill Mauldin's 'GI Joe' doesn't look that way. Well, he does, and here's proof."

During his Army career Mauldin has drawn hundreds of cartoons. His own favorite is a sketch of an old cavalry sergeant pointing a revolver, in grief, at the radiator of his broken-down old jeep. That drawing, he says, is really funny. The artist has several taboos for his work: he does not use sex as a subject; he did not portray Germans as funny or ludicrous—the enemy in mortal combat is never comical, he declares; and he does not portray fear or death. He cannot be "cute" about war, he feels; he can only try to make something out of the humorous situations which accompany misery.

Since his cartoons have continually satirized the military hierarchy, Mauldin has frequently been reprimanded. His contention is that the long-suffering doughboy should be allowed the pleasure of "tossing an occasional tomato" at "a brass hat." Some officers agree with this theory; others feel the cartoons are disrespectful or objectionable for other reasons. At one time on the verge of military arrest, Mauldin was championed by General Mark W. Clark '42. Later Mauldin clashed with General George S. Patton '43 on the subject of the cartoons. Patton considered them injurious to morale and threatened to ban *Stars and Stripes* from his area unless Mauldin made his men less grimy. At the suggestion of General Eisenhower who enjoys the cartoons himself, the Sergeant and General Patton met to discuss the matter. After the conference Mauldin reported: "I came out with all my hide on. . . .I don't think we changed each other's opinions. . . .A soldier's mind is his own property." Mauldin's GI's remained unshaven and unwashed, but an April 1945 cartoon depicted Joe attempting to carry out Army orders to shave off his tough beard. The caption under the sketch reads: "By gad, sir, I *tried*!" Patton continued critical of Mauldin and his cartoons: "He's the Bairnsfather of this war and I don't like either of them." Hanson Baldwin's '42 comment was: "As long as Regular Army officers . . . think that Bill Mauldin's cartoons are destructive of morale, just that long will there be an officer-enlisted man problem."

But the soldiers find no fault with Bill Mauldin. His second book, *Mud, Mules and Mountains*, sold three hundred thousand to the Fifth Army in Italy, where GI's put it in their rucksacks. Further evidence of his popularity was a six-foot reproduction of his infantryman on the Fifth Army float at the big Fifth Army-Twelfth Air Force football game on New Year's Day 1945. Tom Meany, reporting the game for *PM*, described Joe as "the raggedy hero of every soldier in Italy." In March the *Army Times* proposed that Bill Mauldin be sent to the San Francisco conference in April 1945 to represent the "Foxhole Fraternity." His fourth book of cartoons, *Up Front*, containing a hundred and sixty drawings and thirty thousand words of text, was published in June and chosen by the Book-of-the-Month Club for July distribution. The original publishers completely exhausted their stock within two weeks after publication; with no paper available they disposed of the publishing rights to a reprint house which sold a million copies in the first month. (International Pictures bought the motion picture rights and Mauldin is scheduled to go to Hollywood to help write the screen version.) Mauldin had been awarded the Pulitzer Prize in May 1945 for a particular cartoon in his *Up Front With Mauldin* series, captioned "Fresh, spirited American troops, flushed with victory"—a drawing of American bedraggled soldiers in pouring rain.

In Europe the artist had a jeep assigned to him by General Clark. This vehicle, which he named Jeanie, was a traveling pin-up gallery of pictures of his wife and son, and had portraits of Joe and Willie painted on the outside. The back seat was made into a locker in which rations and drawing materials were packed, and Mauldin used the top of the seat for a bed. The entire jeep could be blacked out so that he could work at night by light supplied by built-in batteries (he often went two or three days without sleep). He never tired of talking with soldiers and was a stickler for accuracy of details in his drawings—spending hours sketching new uniforms, equipment, and weapons. If he missed a point, he said, he was mercilessly "kidded" by the GI's.

With sufficient discharge points to his credit, Mauldin came home in June 1945, two days before *Up Front* was published, to his wife and Bruce, their twenty-month-old son in Los Angeles. (In October, however, he filed a divorce suit against his wife, asking for the custody of the child). Willie and Joe have come home, too, cleaned up and shaved, in the new series, at first called *Sweatin' It Out With Mauldin*, and later superseded by individual titles. According to *Time*, Mauldin does not think Willie and Joe are going to be a problem: "They are so damned sick and tired of war that their only ambition will be to forget it. They don't need pity . . . they simply need bosses who will give them a little time to adjust their minds and their hands, and women who are faithful to them, and friends and families who stay by them until they are the same guys who left years ago." At the fourteenth New York *Herald Tribune* Forum in November Bill Mauldin made a spirited speech against racial intolerance: "One of the greatest foundations upon which our country is built is the creed that every citizen shall have the right to freedom of expression, and worship, and of life, liberty, and the pursuit of happiness. Anything designed to deprive any citizen of any of these rights is the greatest un-American activity of all."

According to his *Saturday Evening Post* biographer, Frederick Painton, who interviewed the young cartoonist on the Anzio beachhead in late 1944, Bill Mauldin has "jug-handle ears, big brown eyes with a satyr expression, and a boyishly smooth complexion that only requires a razor—to his secret sorrow—once a week. His uncombable shock of black hair, his youthful grin, and his slim, eager walk make him appear some high school kid not quite dry behind the ears. He is twenty-three, and when he is tired he looks all of sixteen."

MAULDIN, WILLIAM HENRY *See* Mauldin, B.

MAYS, BENJAMIN E(LIJAH) Aug. 1, 1895- College president

Address: Morehouse College, Atlanta, Ga.

BENJAMIN E. MAYS

The president of Morehouse College in Atlanta, Georgia, an outstanding Negro institution for men, is Benjamin E. Mays, prominent leader in education and religion. Mays has contributed widely to educational and religious publications concerned with the problems of the Negro people. On February 19, 1945, on the occasion of the seventy-eighth anniversary of the college, Mays delivered a radio address which expressed the purposes of Morehouse and at the same time gave a glimpse into the character and life work of the speaker. He said: "It will not be sufficient for Morehouse College, for any college, for that matter, to produce clever graduates, men fluent in speech and able to argue their way through; but rather honest men, men who can be trusted in public and private life—men who are sensitive to the wrongs, the sufferings, and the injustices of society and who are willing to accept responsibility for correcting the ills."

Benjamin Elijah Mays was born in Epworth, South Carolina, August 1, 1895, to S. Hezekiah and Louvenia (Carter) Mays. He attended the high school of South Carolina State College, completing the course in three years and graduating as class valedictorian (1916). He went North for his higher education, first to Bates College in Maine and later to the University of Chicago. At Bates the young man was a leading campus figure, scholastically as well as in extracurricular activities. He was an honor student (Bates College elected him to Phi Beta Kappa in 1935) and served as president of the debating council, of Bates Forum, and of the Phil-Hellenic Club; he was also a member of the YMCA cabinet and a star intercollegiate debater. After receiving his B.A. degree in 1920 he prepared for the church and was ordained a Baptist minister two years later. His first pastorate at the Shiloh Baptist Church of Atlanta was close to Morehouse College, where he taught higher mathematics until 1924. The following year he received his M.A. from the University of Chicago and in 1935 he was awarded his Ph.D. degree. In 1925 he became instructor of English in the State College of South Carolina at Orangeburg.

His first wife was Ellen Harvin. On August 9, 1926, he was married to Sadie Gray, teacher and social worker, who had also received her M.A. from the University of Chicago. The couple have since worked together wherever Mays's work has taken them. In 1926 he was appointed executive secretary of the Tampa (Florida) Urban League. After two years at this post he became national student secretary of the YMCA. From 1930 until 1932 he directed a study of the Negro churches in the United States under the auspices of the Institute of Social and Religious Research in New York City. Out of this work grew his book *The Negro's Church*, written in collaboration with J. W. Nicholson and published in 1933. This volume is an exhaustive survey of the Negro church in America, based on a firsthand study of 609 urban and 185 rural churches in twelve cities and four rural areas. Carefully documented, the book treats of various aspects of the Negro church with scholarly thoroughness. In later years Mays discussed this subject in magazine articles.

The educator's next position took him to Washington, D.C., where he became dean of the Howard University School of Religion in 1934. During his six-year administration the school attracted national attention and was rated Class A by the American Association of Theological Schools. During this period Mays represented the United States at various world conferences. In 1937, with twelve other Americans, he attended the World Conference of the YMCA in Mysore, India. That year he was also present as America's delegate at the Oxford Conference on the Church, Community, and State at Oxford University, England. In the course of these years of travel Mays's opportunity to observe foreign countries and peoples was extensive: in 1937 he and his wife traveled in England, Scotland, Holland, Ger-

MAYS, BENJAMIN E.—*Continued*

many, Switzerland, and France. Two years later he again represented the YMCA, this time at the Plenary Session of the World Committee in Stockholm. That same year he was a leader at the Youth Conference in Amsterdam.

Mays became president of Morehouse College in July 1940. The school, a fully accredited liberal arts college for men, is part of the Atlanta University system. Rated Class A by the Southern Association of Colleges and Secondary Schools, Morehouse is the alma mater of many leading Negroes of the nation. During Mays's wartime presidency, a period of difficulty for all colleges, the school's enrollment has "remained satisfactory." In the 1945 spring issue of the Morehouse College *Bulletin* the president stated the school's educational aims: "To improve the quality and quantity of our work to the end that our graduates will improve the quality of their leadership in their respective communities. . . .We should strive to produce men superior in poise, social imagination, integrity, resourcefulness, and superior in possessing an all-embracing love for all peoples irrespective of race or color." The Negro should see, he also has said, that "his sufferings and his ills are fragmentary parts of the sufferings of all peoples in history from the dawn of man up to the present." He has lectured in some seventy colleges in the past few years. Notable among these addresses was his "The Crisis in Race Relations: Which Way for the Church and Democracy?" at Vassar in September 1944.

Mays's many writings include articles in such publications as the *Crisis, Christian Century, Journal of Negro Education* (of which he is a contributing editor), *Missions*, and *Woman's Press*. He has also contributed book reviews to various magazines, and 1938 saw the publication of his second book, *The Negro's God*. This volume traces the development of the idea of God in Negro literature from 1760 to 1937. Delving into the history of the Negro in America, the author examines the literary expression of the Negro's conception of God from its early roots in slavery to the modern atheistic tendencies. All theses are illustrated by excerpts from original sources. Mays discusses the literature of the Negro masses as seen in spirituals, sermons, and prayers, proceeding further to an analysis of classical Negro literature. In the latter category the writer includes the early poets and the work of Booker T. Washington. Developing his theme, Mays reviews the work of leading modern Negro writers, including W. E. B. Du Bois '40, Claude McKay, James Weldon Johnson, Countee Cullen, and Langston Hughes '40. Summarizing his subject in historical perspective, Mays declares: "The Negro's firm faith in God has saved him, up to this point, from violent revolutionary methods of achieving his rights. His faith in God has not only served as an opiate for the Negro, but it has suggested and indicated that pacific and legal methods are to be used in achieving them. It is not too much to say that unless liberal prophetic religion moves more progressively to the Left in the effort to achieve complete citizenship rights for the Negro, he will become more irreligious and he will become more militant and communistic in his efforts to attain full manhood in American life."

Mays devoted himself to the struggle for interracial understanding early in his career. In March 1931 the *Christian Century* published his article "Realities in Race Relations," called a frank and objective discussion of the complex problem. He emphasized the need for white and Negro people together to face the issues sincerely and honestly, thus gradually eliminating the barrier of distrust between them. He cited as progressive steps toward interracial improvement the development of genuine student friendships on a Christian basis, the awakening of the public mind, and the creation of a public opinion against mob violence and anti-Negro political campaigning. However, on the debit side remains the concrete fact of the injustice and discrimination in the administration of public funds for the Negro in education, recreation, health, dependency, delinquency. In addition, economic and cultural conflicts exist; especially obvious is the competition for jobs. Mays further pointed out that the Negro resents "patronage, paternalism, and condescension" on the part of the white man. Patience and tolerance are essential to good relations between the two groups, he declared.

Mays discussed another aspect of the same theme in an article entitled "The American Negro and the Christian Religion," published in the July 1939 *Journal of Negro Education*. Examining the Negro within the framework of Christianity, he found him discriminated against in every area of American life, a policy, he states, that is sanctioned for the most part by religious groups and administered by so-called "Christians." However, Mays stressed the valuable charitable contributions of Christian groups on behalf of the Negro in the educational field. Emphasizing the need for a crusade to abolish all dualism in American society, he called for a strong Christian endeavor for the realization of Christian ideals in race relations. In another article in the same publication for July 1940, he wrote on the topic "The Religious Life and Needs of Negro Students." In this lengthy analysis, statistically annotated, Mays stated that "the Negro church is the most completely owned institution" of the Negro race. Again on the subject of the Negro church, Mays's article in the 1940 Summer number of *Christendom* discussed its origin, development, and problems. The Negro church has played a significant role in American life, "keeping one-tenth of America's population sanely religious in the midst of an environment that is, for the most part, hostile to it."

In July 1942 the *Journal of Negro Education* carried Mays's discussion of "The Role of the Negro Liberal Arts College in Post-War Reconstruction," in which the special problems of the Negro student were given attention. Mays also considered the issue of the Negro soldier, fighting for democracy on foreign battlefields, only to return home to be denied the rights of democracy. Enlarging on Lincoln's view, Mays declared: "If years ago this country could not exist half slave and half free, it cannot continue to exist now half democratic and half totalitarian." The keystone of the college president's policies can be seen in his article in the *Christian Century*, called "Negroes and the

Will to Justice" (October 28, 1942). Here he declared, "Truth is seldom, if ever, found in extremes." He advocated the peaceful, sane road to justice for the Negro, aware, however, that "social changes come slowly and deep-seated prejudices die hard even when civilization hangs in the balance." Contending that certain steps can be taken now "within the present structure of society" to promote interracial adjustment and democracy, Mays outlined a brief program: (1) Give the Negro equal opportunity to earn a living; (2) abolish all devices which deprive him of the right to vote; (3) give the Negro equal opportunity in education; (4) improve his health conditions; and (5) give him justice in the courts. These measures, for which all legal bases already exist, can be accomplished through the concerted efforts of the nation's officials, editors, teachers, and labor leaders, Mays believes. According to *Time*, he is a "firm believer in education and patience as cures for racial discrimination."

In December 1944 Mays was elected vice-president of the Federal Council of the Churches of Christ in America, the first member of his race to hold that office; he will serve with Bishop G. Bromley Oxnam '44. The distinguished educator belongs to several organizations, including the Commission on Interracial Cooperation, the Southern Regional Council, the Commission on Basis of a Just and Durable Peace, and the Commission on Christian Strategy for Post-War Planning. Mays is a member of Phi Beta Kappa, and of three fraternities, Delta Sigma Rho, Delta Theta Chi, and Omega Psi Phi; and he is also a member of the national board of the YMCA. A well known lecturer, he is frequently called to speak before Southern white audiences, as well as Negroes, and he has lectured at more than eighty colleges in the United States. In a New York interview in December 1944 Mays called education the Negro's "number one problem," followed closely by suffrage restrictions, especially the "white primary." He added that the racial policies of the South, determined by the minority ruling class, will never be reformed by the South alone. Mays was in 1944 named on the Schomburg Honor Roll of Race Relations as one of twelve Negroes who have done outstanding work in building better race relations in America.

Mays is a handsome, dignified figure, nearly six feet tall and weighing one hundred and sixty-three pounds. A quiet, earnest man, this Baptist minister is so tolerant that it is said he has never thought of proselytizing his Methodist wife. The Negro leader has stated that his belief in man, based on Christian faith, governs his behavior, and his own life, he says, has been enriched by the friendships of people of many nations and religions.

MEITNER, LISE (mīt′nẽr lē′zĕ) Nov. 7, 1878- Austrian physicist

Address: b. c/o Nobel Institute, Stockholm

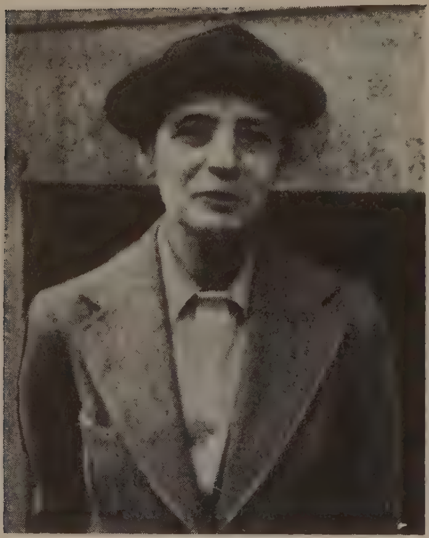
When the dream of utilizing atomic energy was finally realized with the release of the atomic bomb in the summer of 1945, public attention was focused on several scientists whose long years of research had brought civilization to the threshhold of the Atomic Age. Among those internationally recognized pioneers in science is Lise Meitner, Austrian physicist and mathematician. Her research in atomic physics, especially her work in uranium fission, played a significant part in the development of the greatest scientific achievement in centuries.

A Viennese, Lise Meitner was born on November 7, 1878, the daughter of a lawyer and one of a family of seven children. She began her science studies in Vienna, where she became interested in atomic physics during her first year of work, and as an aspiring scientist she was fascinated by the newspaper accounts of the discovery of radium by Pierre and Marie Curie in 1902. In 1908 her advanced studies brought her to Berlin, where she studied theory with the renowned German physicist, Dr. Max Planck. (Planck originated the quantum theory and won the Nobel Prize for physics in 1918.) At this time she also began her experimental work with Dr. Otto Hahn which gave her the opportunity to study further the radioactivity of the atom.

Dr. Meitner became assistant to Planck at the University of Berlin, in which capacity she served for three years, at the same time continuing her work with Hahn. While Germany was at war, in 1917, she was charged with the organization of a department of physical radioactivity at Berlin's famous Kaiser Wilhelm Institute. There, as a professor and leading member of the institute, Dr. Meitner's research facilities were much enlarged by the addition of a staff of assistants and students, and she was able to concentrate on the study of the natural and artificial transmutation of the elements.

In Berlin, the center of scientific research, Dr. Meitner studied the developments in the field of atomic physics while conducting experiments with Hahn and with Dr. Fritz Strassmann. She won a distinguished reputation for her work on the products of the disintegration of radium, thorium, and actinium, on the behavior of the beta rays, and on the physics of the atomic nucleus. In 1918, together with Hahn, she discovered protoactinium, a radioactive element which, by disintegration, yields actinium.

In 1938 the three scientists, Meitner, Hahn, and Strassmann, announced the creation of a trans-uranium element (heavier than uranium), produced by bombardment of uranium with neutrons. Meitner and Hahn were repeating the experiment of Enrico Fermi, also a Nobel prize-winner, to liberate the energy within the nucleus of the atom. For this work the two scientists at the Kaiser Wilhelm Institute had devised an "atomic microscope", a very delicate instrument, for the observation of chemical action. Firing slow-speed neutrons (electrically neutral particles) at the uranium nucleus, they were startled to observe the appearance of barium, an element which had not been present



LISE MEITNER

at the beginning of the experiment. Before the mystery of the barium was solved, Dr. Meitner, who is a Jewess, left Germany. (According to a report in the New York *Sun*, she had been dismissed from her teaching post at the University of Berlin in 1933.) A confirmed anti-Fascist, the scientist chose to leave the country, although the Nazis were willing to overlook their anti-Semitic laws to compel her to remain in the Reich to continue her work. She escaped with the assistance of Dutch colleagues who had obtained permission for her to enter Holland without a visa, since her Austrian passport had become invalid. Thus, in 1938, traveling via Holland and Denmark, Dr. Meitner arrived in Sweden.

By the time Dr. Meitner had reached Stockholm she had solved mathematically the supposed barium mystery, and she made known her findings in a report for a scientific journal. (In an article for the Overseas News Agency in August 1945 she wrote that her report was actually an interpretation of an experiment done by Hahn and Strassmann in connection with experiments made before she had left Germany.) Her report revealed that the unexplained appearance of barium indicated the fission of the uranium atom, one part being the barium, the other krypton. This was an astounding discovery. Although scientists in the past had succeeded in chipping off small pieces of the atom, none had split it into halves. According to her interpretation, the uranium atom, the heaviest of the elements, having an atomic weight of 92, was split into two nearly equal parts—barium (56) and krypton (36). She calculated that the atomic energy released by thus splitting it amounted to two hundred million electron volts per atom. William L. Laurence, in an article describing Dr. Meitner's work (*Saturday Evening Post,* September 7, 1940), wrote, "She was experiencing sensations that must have been akin to those of Columbus. . . .She and Dr. Hahn had accidently stumbled upon one of the greatest discoveries of the age. They had come upon the trail of what might lead to the shores of the Promised Land of Atomic Energy."

Through the efforts of Dr. Otto R. Frisch, Dr. Meitner's nephew, the results of the experiment were transmitted to Dr. Niels Bohr '45 in America in January 1939, and he immediately made known the information to the scientific world. In releasing the report, Dr. Meitner and her co-workers had had no thought of the destructive use to which their discovery would be put, but both Germany and the Allies saw the possibility of utilizing it for military purposes. In the United States the production of an atom bomb became a project of the War Department, under the direction of General Leslie R. Groves '45, while in Germany scientists worked feverishly at the problem—until the Allies won both the military and the scientific race.

The news that the Allies had dropped an atomic bomb on the Japanese city of Hiroshima on August 5, 1945, came altogether as a surprise to the physicist as she rested at a summer hotel in Dalarne province in central Sweden. Thrust suddenly into the world spotlight, she was reluctant to discuss her part in the development and a few weeks later released only a modest description of her work through the Overseas News Agency. The American press carried glowing tributes to Dr. Meitner, pointing out that the Nazis had deprived themselves of her work. In a New York *Times* article Harry M. Davis declared, "Generations millenniums hence may look back upon these years when atomic energy was first put to work in the same spirit in which we now think of the less well-documented occasion when man first learned the use of fire."

Speaking from Leksand in Sweden, Dr. Meitner participated in a joint NBC transatlantic broadcast with Eleanor Roosevelt '40 on August 9. Mrs. Roosevelt congratulated the scientist and compared her to the great Marie Curie, adding the wish that Dr. Meitner might some day visit America as did the Polish physicist. (She has been invited to join the faculty of the Catholic University of America in Washington in February 1946 as a visiting professor and to lecture in the physics department.) Expressing her hopes for world cooperation and peaceful use of science's tremendous discovery, Dr. Meitner stated, "Women have a great responsibility and they are obliged to try, so far as they can, to prevent another war. I hope that the construction of the atom bomb not only will help to finish this awful war but that we will be able, too, to use this great energy that has been released for peaceful work." On the question of use of the discovery, she has said, "I think it should be controlled very carefully, internationally."

The scientist was active on the political front, working with the Democratic Austrian Society, an organization which resisted Nazism during the war. She declared that she had no intention of returning to Germany. In Sweden she has been associated since 1938 with the Nobel Institute in Stockholm. Dr. Meitner was elected a foreign member of the Swedish Academy of Science in October 1945. The honor has been conferred on only two other women in the two hundred years of the academy's existence—a Swedish woman, elected in 1748, and Mme.

Curie, elected in 1910. In addition, Dr. Lise Meitner lectures at universities and clubs. She has continued her work on uranium fission at the Research Institute for Physics and plans to carry on her work with Professor Karl Manne Siegbahn of the Academy of Science. The March 16, 1940, issue of *Nature* carried her report on her work on the "capture cross-sections for thermal neutrons in thorium, lead, and uranium 238." Dr. Meitner contributes to scientific journals and is the author of various works, including *Beiträge zur Physik der Atomkerne* (1926), *Der Aufbau der Atomkerne* (1935, with Max Delbrück), and a study "on the products of the fission of uranium and thorium under neutron bombardment" (1940, with Frisch).

Scientist Lise Meitner is described as a small, dignified woman with a quiet voice and rather a shy manner. When speaking to people she will at times "employ a friendly sympathetic smile that begins quickly about the mouth and fades slowly and reluctantly from her brown eyes." She resides with a sister in Stockholm, while two other sisters live in the United States, in New York and Washington.

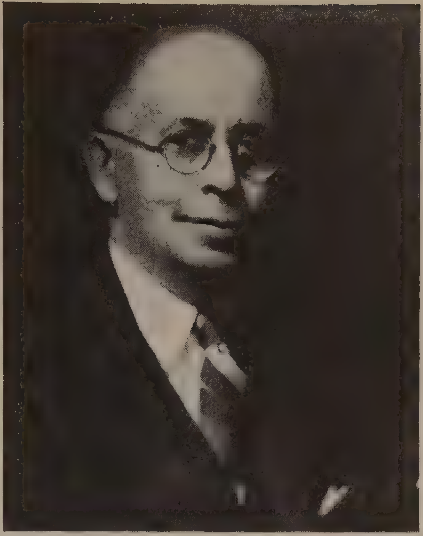
MELCHER, FREDERIC G(ERSHOM)

Apr. 12, 1879- Magazine publisher, editor; author

Address: b. Publishers' Weekly, 62 W. 45th St., New York City; h. Montclair, N.J.



Bachrach

FREDERIC G. MELCHER

"Zeal is an old-fashioned word," wrote Christopher Morley in a tribute to Frederic G. Melcher, editor of *Publishers' Weekly* and president of the publishing house of R. R. Bowker Company, "but I can't think of anyone more zealous than Fred Melcher. The number of books, schemes, ideas, transactions, ceremonies, speeches, promotions, dinners, awards, conferences, editorials, articles, that have passed through his mind, leaving, apparently, no trace of erosion or corrugations on his brow, staggers me to contemplate, even with only one finger on the keyboard of my typewriter." The occasion for Morley's words was the celebration of the fiftieth anniversary of the publisher-editor's entrance into the book trade. And to that encomium Mildred C. Smith added that Fred Melcher "has made the *Publishers' Weekly* an exciting place to work; he has made publishing, bookselling, librarianship, work with children's books and with the graphic arts seem a more exciting occupation in all the fifty years in which he has been connected with them."

Books are among Frederic Gershom Melcher's earliest memories. Born in Malden, Massachusetts, six miles from Boston, on April 12, 1879, he is the son of Edwin Forrest and Alice Jane (Bartlett) Melcher. The Bartletts were Bostonians, the Melchers New Hampshiremen. When Fred was four his family moved to a lakeside house at Newton Center, about fourteen miles away. From Melcher's reminiscences, his youth must have been extremely happy, for he writes, "A lake shore is a fine place to grow up, for there is, of course, swimming, boating, fishing and skating, with the pleasant industry of ice-cutting going on near-by"; he tells, too, that he "had the good luck to grow up in a congenial crowd of twenty or thirty resourceful young people." "As we grew beyond the little home parties of childhood, we had our dances, husking bees, sleighing parties, and canoeing trips." A "busy reader of almost anything that came to hand," the boy read five weekly and three monthly magazines, as well as all the books he could find. At the Mason Public School he skipped one grade and took two others at once ("they must have been getting a little crowded"), thus enabling him to catch up to his sister, Mabel, and older cousin. Fred entered the Newton High School at twelve (he was exempted from military drill because he was too small to handle a gun) and took a course intended to prepare boys for the Massachusetts Institute of Technology. At school he was more attracted to literature than to chemistry or mathematics; but the "Institute Course" did not include enough Latin and Greek to satisfy college entrance requirements, and sixteen-year-old Fred Melcher decided to go to work instead of studying further.

"Jobs were as scarce after the panic of 1893 as they were to be forty years later," but his grandfather found Fred a position with one of his tenants, the Boston booksellers Estes and Lauriat. The tall, gangling boy was hired at the "going rate" of four dollars for a six-day week, and he began to work as soon as his school closed for the summer in 1895. Young Melcher first worked in the mailing room, where he is recalled as "alert, inclined to seriousness, and not unduly given to skylarking with other boys." Next he was promoted to the receiving department, where he opened bundles and cases for two years; then he was assigned to handle library orders. (On occasion, too, Melcher carried a spear as supernumerary in "many a grand opera of the

MELCHER, FREDERIC G.—*Continued*

de Reszke and Nordica days" around the turn of the century.) In Boston young Melcher came under the influence of the famous printer Daniel Berkeley Updike, who first aroused his enthusiasm for beautiful books and his appreciation of the craftsmanship of bookmaking.

By 1906 Frederic Melcher was a popular salesman with a large personal following: he "studied to know his customers as he knew his books, and he matched one to the other with an almost incredible accuracy." He took time also to study book classification, stock arrangement, and store routine, and to suggest improvements; as assistant to the Lauriat buyer, he persuaded that conservative gentleman to accept new ideas. In 1908, when publisher George H. Doran had written off Arnold Bennett's *The Old Wives' Tale* as a failure, Melcher read a laudatory British review and so thoroughly impressed his clientele with the book's value that he sold five hundred copies in two weeks. (The total sale up to that point had been three hundred and fifty copies.) Doran calls Melcher "the first among bookmen the world over to discover the essential potential classic quality of Arnold Bennett's *The Old Wives' Tale*." When the Boston Booksellers' League was organized he was an active member, as well as of the American Booksellers Association, and he attracted considerable attention by maintaining that, while the book buying problems under discussion were of importance, "we should go forth . . . chiefly resolved to concentrate on book*selling*." A year later, in 1912, Melcher became the Boston Booksellers' League president.

In 1913 W. Kerfoot Stewart asked Melcher to manage his Indianapolis bookstore. The thirty-three-year-old bookman moved to Indiana that March with his wife, the former Marguerite Fellows, whom he had married in 1910, and their son Daniel. (Melcher's two other children are named Nancy and Charity.) Three weeks later came the "Dayton flood." The next January (1914) the bookstore was destroyed by fire, but within three days Melcher had found temporary quarters, acquired a new stock, and had opened for business. The store prospered under his direction, and was patronized largely by artists and writers. "Everyone who has lived in Indianapolis in the second decade of this century and who bought books owes a debt of gratitude to Frederic Melcher," writes Booth Tarkington. Others who often dropped into the bookshop were Vachel Lindsay, Albert Beveridge, George Ade, and James Whitcomb Riley, while Melcher often discussed the making of fine books with the great printer, Edwin Grabhorn. A member of the Indianapolis Literary Club, and the Portfolio Club of artists, musicians, writers, and assorted literati, Melcher is remembered for "the breadth of his knowledge and the delightful energy of his participation in whatever topic came up for discussion." A lay reader at a Unitarian church, the New Englander led the church children in carols each year, and he "could make them sing like all get-out." Melcher also took an interest in librarianship, beginning "those inspiring talks to library groups which have been one of his greatest contributions to the book world." When the First World War came, he started two branch stores at Fort Benjamin Harrison, and these, too, prospered.

According to Harry Hansen '42 of the New York *World-Telegram*, while in Indianapolis Melcher wrote to the *Publishers' Weekly* in praise of Robert Frost's book of poems, *North of Boston*. This won him the gratitude of Frost's publisher, Alfred Harcourt, the firm friendship of the poet, and the attention of the magazine. In 1918 Melcher went East to New York to become coeditor of the *Weekly*. (He is now president of the R. R. Bowker publishing company, which puts out *Publishers' Weekly* and the *Library Journal*.) The next year the new editor recognized the importance of the making of books by giving that subject a full column, which grew into a critical department, *Book Clinic*, seven years later.

Children's Book Week, which he and Franklin K. Mathiews, the Boy Scouts' chief librarian, evolved in 1919, is now observed annually from coast to coast by librarians, bookshops, and schools, and its influence is spreading to other countries. In 1920 Melcher began to devote special issues of *Publishers' Weekly* entirely to juvenile literature; he is credited with a share in persuading the Macmillan Company and Doubleday, Doran and Company to set up departments for publishing such books; and in 1921 he established the Newbery Medal, given annually for the most distinguished contribution to American literature for children. It is named for the first seller of juvenile books in English, and was first awarded to Hendrik Willem van Loon's *Story of Mankind*. In 1937, Melcher also established the annual Caldecott Medal (named for the nineteenth-century illustrator) for the most distinguished American picture book for children; the first award went to Dorothy Lathrop's *Animals of the Bible*. Selections are made by the Children's Librarians Section of the American Library Association.

Melcher's years of editorship are summed up by Hansen: "The possibilities of making books better, more useful, more widely distributed, more fairly sold, were always on the editor's mind. He neglected nothing. Religious books, technical books, war books—all had his attention, and his comment led the special issues. He supported all progressive measures, whether copyright law revision or fair trade practices. He gave librarians a voice in his journal and endorsed attempts to interest new groups, advocating the extension of libraries in secondary schools and even challenging architects to serve culture—and the book trade—by building bookcases in new houses. There is no phase of publishing that has not received its just attention in the *Publishers' Weekly*. And all this comment came from a man who put on his hat and coat and left the office to keep himself informed. There were many hours of legwork, of rides on trains, of patient meetings with long-winded committees behind these editorials."

In his first year in New York Melcher became secretary of the American Booksellers Association, and is now an honorary fellow. He served as head of the copyright committee of the National Associaton of Book Publishers, and later the Book Publishers Bureau, and helped to draft the NRA code. From 1920 to 1924 he was executive secretary of the National Association of Book Publishers; in 1924-25 he was president of the New York Booksellers' League; two years later he became president of the American Institute of Graphic Arts; and in 1935-36 he served as president of the New York Library Association. Melcher's other memberships are in the P.E.N. Club, Authors' League of America, American Antiquarian Society, Grolier Club, Bibliographical Society of America, American Library Association, American Library Institute, and the National Council of the Boy Scouts of America. It has been said that "wherever there were committees, there you were sure to find Fred Melcher working." He has endowed a number of awards in the book field, and attended International Congresses of Publishers in Paris and London. In the summers of 1927, 1928, and 1932 he gave a course at the Library School of Columbia University on practical aspects of bookselling, and he has delivered many other lectures, especially to librarians.

It was Melcher who initiated the quadrennial A. B. A. gift of two hundred books to the White House Library. (Having discovered that there were "practically no books" there, the Association in 1929 had presented the White House with the five hundred basic books with which a good private library should begin.) Melcher, again chairman of the selection committee in 1945, reported that the year's fiction list would be very thin and that history, current affairs, and biography would furnish most of the titles. He "rounded up" the National Council on Books in Wartime in June 1942, and, in the opinion of War Production Board chairman J. A. Krug '44, his complete cooperation and wide following have made his editorials "of inestimable value . . . in creating a better understanding of, and cooperation with, those of our [WPB] programs entailing a reduction in use of the materials consumed by the book industry and in critically short supply." In March 1937 the *Atlantic Monthly* had identified him as, "for close to twenty years . . . the best-trusted referee in American publishing." In the days between the two World Wars, when the Leipzig Book Fair and other international meetings of publishers were instruments of good will and understanding, Melcher represented the American publishers at Leipzig and at the International Congress of Publishers in Paris in 1931 and in 1936 in London. In June 1945 he again went to London, this time for six weeks, at the invitation of the new National Book League of England, founded in 1944 with John Masefield as its first president. The trip was sponsored by the OWI.

In May 1945, his fiftieth year in the book trade, Melcher was given a testimonial dinner by its leading members. Guests were presented with a small book, *Frederic G. Melcher: Friendly Reminiscences of a Half Century Among Books and Bookmen,* published by the Book Publishers' Bureau for the occasion. Chapters in the book are by the reviewer Harry Hansen, the rare-book seller Charles Goodspeed, the librarian Harry M. Lydenberg '41 and seven other authors. One of them, Marion E. Dodd, more or less summed up the tribute of the others when she wrote that Melcher "now stands as number one liaison man to all the branches of the book world. His specific knowledge of publishing, of the graphic arts, of the problems of libraries, and of the distribution of the printed word by booksellers has rolled up into great authority . . . . Whatever he has done, wherever he has been down through these fifty years, Fred Melcher is first and foremost a creative bookseller, a master in the art of the distribution of books." The same month the bookman was awarded the Gold Medal of the American Institute of Graphic Arts. At the mid-winter meeting of its Council in Chicago, Melcher was elected an honorary member of the American Library Association. This rarely-bestowed distinction was held in 1945 by six persons who, the association felt, had given especial service to the cause of books and reading.

Lean, bespectacled Melcher was once described as "informal as his red tie, direct, cheerful, optimistic, interested . . . unhurried and unobtrusive in manner . . . a quiet-spoken, friendly man who had the beginnings of a smile curling at the corners of his mouth when he talked. . . . I have never known a man to be so well informed, so ready to lend what help he could and make so little fuss in doing it." His home, an old New Jersey farmhouse around which the town of Montclair has grown up, "has abounded with the Melchers, their children, dogs, friends, bridge tables, and books these many years, notably the friends and books." He enjoys swimming, skating, sailing, and all the work entailed in serving huge beach suppers at his summer place on Cape Cod. Melcher's particular treasure is his collection of beautiful books, especially Pickerings and some Grabhorn editions. His test for a well-made book is simple: "It *feels* right and you feel right about it." Himself a Unitarian, Melcher feels, as he said in one of his editorials, that "no one can be satisfied with the world as we have built it. No one nation, race, or religion can have by itself the complete solution of the problems ahead. . . . There is need to resolve that all denominations work together. There is need not only for solidarity on military and political fronts, but also on the fronts which face the big problems of life."

MELTON, JAMES Jan. 2, 1904- Singer
Address: c/o Evans and Salter, 113 W. 57th St., New York City; h. Westport, Conn.

The popular artist of radio, concert, and opera, American tenor James Melton, was born in Moultrie, Georgia, on January 2, 1904. Both his parents were amateur musicians: His father, James Wilburn Melton, a lumberman, was a singer and a musician in the Moultrie band; his mother, Rose (Thornton) Melton, was an organist. Soon after James's birth the family

JAMES MELTON

moved to Citra in northern Florida, where the elder Melton owned and operated several large lumber mills. As he grew up, it was young James's delight to do some of the company's errands in his father's car, driving even at the early age of twelve; for then, as now, he loved automobiles. One of the most enjoyable of the assignments he was given was to pick up the Negro millhands in town to drive them out through the woods to the mill, and it was from these workers that he learned many of the spirituals he now sings.

Upon graduation from high school in 1920 Melton entered the University of Florida to prepare for a career in law. To pay his expenses, he sang with the college band and led a dance orchestra which he had organized. It was these musical activities rather than his work in the prelaw courses which brought Melton to the attention of the university's president, Albert A. Murphree, who, discerning the latent talent of the young student, helped him to revise his plan of study to further his potentialities and personally guided his development during the two years he remained at the university. After his sophomore year Melton left Florida to attend the University of Georgia, where he studied for a year, earning his living expenses meanwhile by playing the saxophone in the college band. In 1923 he entered Vanderbilt University in Nashville, Tennessee, and began grand opera studies with Gaetano de Luca.

After leaving Vanderbilt University in 1924, Melton continued to study with De Luca in Nashville, having been assisted by three businessmen friends who lent him the necessary funds. (The money he later paid back, with interest, in one year's time.) Then, when he arrived in New York in 1927 the Southerner besieged "Roxy" Rothafel for an audition, singing outside the manager's door, it is said. Melton's approach was successful, and so was the audition: Rothafel hired him as a member of his Roxy Gang, the well known group of entertainers who gave frequent performances over the Columbia Broadcasting System. This work brought him an engagement with the Revelers Quartet, "an outstanding radio quartet and one of the earliest groups of 'precision' singers."

Since that time Melton has become one of the most popular singers on the radio: From 1928 to 1931 he sang on the *Seiberling Singers* program; in 1933, the *Voice of Firestone*; in 1935, *Ward's Family Theater*; in 1936, *Sealtest Sunday Night Party*; in 1937, *Palmolive Beauty Box Theater*; in 1938, the *Song Shop*; in 1940, the *Telephone Hour*. Of one of Melton's performances on the *Telephone Hour, Etude* wrote: "James Melton has not sung better at any time during his radio musical career than in the Telephone shows." In July 1944 the tenor took over Fred Allen's '41 show *Star Theater* as the summer replacement. When the comedian decided not to return to radio in the fall, Melton then became the full-time star of the program. Jack Gould of the New York *Times* has since praised Melton for "turning in a fine job. . . .Being the presiding officer [of the musical program], Mr. Melton naturally stands out, as well as he might. His lyric tenor encompasses both the operatic and popular with complete aplomb and, as with others who have had to make themselves heard in the balcony, he really sings, leaving to crooners et al. the substitution of a mike's amplifying qualities for vocal versatility." Another reviewer wrote that Melton in his radio role of star and master of ceremonies of *Star Theater* "manages to provide a pleasing and well-balanced musical fare." In August 1944 Melton was rated in sixth place in the Hooper poll of radio popularity. (He is also a recording favorite.)

Radio was, however, only the first field in which he was to become an established star. His voice teacher, Enrico Rosati, he says, soon opened his eyes to his bigger vocal possibilities. In 1932, therefore, Melton made his concert debut with a recital in New York's Town Hall, and favorable reviews encouraged him to continue with concert work. His first tour was with George Gershwin in 1934. In the succeeding years he built up a repertoire of more than twenty-two hundred selections—arias, *Lieder*, folk songs and traditional melodies, Negro spirituals, modern songs, ballads, and light operatic numbers. The tenor believes that a concert program "can be built with a solid foundation, but every number, whether it is a classic or an English or American song, should be on the program for one purpose; it should have audience appeal and entertain."

After his concert debut Melton in 1936 decided to pursue his earliest singing ambition—opera. The singer explains: "I knew that if I applied myself, the roles could be learned, together with stage technique." He bought a dozen scores and chose as his first opera for study *Madame Butterfly*. After two years of intensive study, in 1938 the tenor made his operatic debut as Lieutenant Pinkerton at the Zoo Opera in Cincinnati, and three months later he repeated this performance with the San Carlo company at the Center Theatre in New York. The New York *Times* reviewer wrote that Melton's "steady tones had all the needed volume for the part and were projected with convincing eloquence and ardor in an interpretation that was natural, sincere and convincing." His second operatic role was that of Alfredo in Verdi's *La Traviata,* which he played in the fall of 1938 with the St. Louis Opera Company. He was awarded a contract with the Chicago Civic Opera Company that same year, and was soon singing opposite such divas as Licia Albanese in *Madame Butterfly,* Josephine Antoine '44 in *Martha,* and Lily Pons '44 in *Lucia di Lammermoor.*

Until 1942 Melton divided his time between radio work and operatic performances with the St. Louis, Cincinnati, and Chicago opera companies. Then in September 1942 he auditioned for New York's Metropolitan Opera Company, singing arias from *Don Giovanni* and *Lucia di Lammermoor* for conductor Bruno Walter '42. "I would like to hear you in *The Magic Flute,*" said Walter, and Melton set about learning the role of Tamino for his second audition. He committed it to memory within five days, and after this second audition won a contract. Three weeks later he made his debut on the Metropolitan Opera House stage, singing his audition role. According to Henry Simon, writing in *PM*, "Melton has a clean way of turning a phrase that most critics would call far more genuinely Mozartean than some of the Puccini-Mozart we get from older hands at the business. His voice is light, a little hard, but well placed, and he uses his six feet of good looks with grace and conviction. . . .His debut made him sound like a thoroughly useful acquisition for the lighter tenor roles and for disillusioning that part of the public which imagines a career in popular music and an engaging, thoroughly American personality disqualify one for the Metropolitan."

Melton's association with the Metropolitan has been described on the whole as "a most valuable addition to the roster of international singers." During the 1944-45 opera season his appearance as Tamino was described by Jerome D. Bohm of the *Herald Tribune* as "Melton's best role, although his agreeable voice would sound still better if less openly projected. His enunciation of the English words, however, might easily serve as a model for the rest of the cast." Olin Downes '43 of the New York *Times* lauded his "fresh and youthful voice, his intelligence and sincerity in whatever he did." Some reviewers liked the singer's portrayal of Wilhelm Meister in *Mignon,* although the *Herald Tribune*'s critic complained, "Mr. Melton is never very happy with Wilhelm Meister's music, and . . . his singing, aside from its customary 'whiteness,' was taut and thin in the upper reaches."

During a performance, an interviewer reports, Melton drinks one pint of pineapple juice, "for energy." Through his years of experience in studying opera, the singer finds that it is best to learn the score of the last act first, since, he says, "Quite often singers learn the first act of an opera with a fresh, inspired feeling . . . but are sometimes apt to slight the last act." In speaking of the libretto, Melton says, "[It] is much more difficult for me to learn than the music, and since we often hear operatic recitatives performed uninterestingly, I learn them in strict rhythm, and exactly as they are written, but during the performance I try to expand them and make out of them a real, interesting conversation."

During March and April 1945 Melton toured the United States and Canada, and in June he made an appearance as soloist with the New York Philharmonic-Symphony Orchestra at Lewisohn Stadium, New York. Noel Straus, reviewing the performance for the New York *Times,* said, "Mr. Melton displayed his usual musicianship in all of his selections, adhering strictly to true pitch. But his tones were pushed and often quavering, as a result of attempting to give them more than their inherent amount of volume." According to the critic of the New York *Sun,* "Mr. Melton, though often tight, pleased many of the five thousand listeners with his appealing native vocal gifts." Then featured on the screen in the all-star musical revue, *Ziegfeld Follies,* Melton was scheduled to appear in the leading role of a musical version of Edna Ferber's *Cimarron,* which was first produced in 1931 with Irene Dunne '45. Earlier, in the thirties, Melton appeared in *Sing Me a Love Song* and *Melody for Two,* both released in 1937.

James Melton is described as "handsome, genial, and easygoing, boyish and brown-eyed", "a good-looking six-foot-two with a pug nose, an ear-to-ear grin, and a cavernous laugh." The singer likes to hunt, and he collects pewter and old glass, but he is best known for his collection of ancient automobiles. Since 1935 he has accumulated about eighty cars, which date back to 1893. A good mechanic, he keeps all the motors in running condition, and during the wartime gasoline shortage he used to drive to New York from his Westport, Connecticut, home in "a little ole 'lectric" or a Stanley Steamer. A prize item is a 1900 Rockwell hansom cab, which is said to be the first taxi used in New York; another is Diamond Jim Brady's 1908 Fiat, with sterling silver fittings. Melton wears on his lapel a diamond miniature, formerly owned by Brady, of another of the financier's cars, a 1906 ("#16") Locomobile which once won a Vanderbilt Cup race. Melton's Rockwell, incidentally, was entered in a benefit race against a horse and buggy in 1943, and lost. The state of Connecticut, proud of being the location for what is claimed to be the largest collection of old automobiles in the world, has appropriated a hundred and fifty thousand dollars to build a museum for them at Stamford. Melton is vice-president of the Veteran Motor Car Club of America.

Melton frequently assists young singers. Two of his protégés are Lawrence Brooks, star of the 1945 operetta *Song of Norway,* and a crippled Negro tenor, Pruth McFarlin, who, Melton says, has "one of the greatest voices" he has ever heard. Since June 1929 Melton has been married to Marjorie Louise McClure, daughter of Marjorie Barkley McClure, novelist. The singer is a member of the Delta Tau Delta fraternity and the New York Athletic and Fairfield County Hunt clubs. In speaking of success, he says, "My real happiness comes from the fact that I have solved many of life's problems by learning how to work."

MENNINGER, WILLIAM CLAIRE

(mĕn'ĭng-ẽr) Oct. 15, 1899- United States Army officer; psychiatrist

Address: b. c/o Surgeon General's Office, 1818 H St., N.W., Washington, D.C.; h. 2260 Cathedral Ave., N. W. Washington, D. C.

U.S. Army Medical Museum

BRIG. GEN. WILLIAM CLAIRE MENNINGER

Because of the large number of neuropsychiatric casualties in the United States Army (43 per cent of all medical discharges), Surgeon General Norman T. Kirk '44 placed psychiatry on an equal footing with medicine and surgery, and in December 1943 appointed Brigadier General (then Colonel) William Claire Menninger as director of the Neuropsychiatry Consultants Division in the Office of the Surgeon General. Co-founder of the Menninger Clinic in Topeka, Kansas, Menninger has long been regarded as one of the country's foremost psychiatrists. His management of the Army's neuropsychiatry division not only has won him the first annual Albert and Mary Lasker Award in 1944 for "outstanding service in the field of mental hygiene," but has done much toward the settlement of "the forty-year feud between old-time psychiatrists and the 'upstart' psychoanalysts who follow, with varying degrees of fidelity, the theories of the old master, Sigmund Freud."

On both sides of his family William Claire Menninger is of German-American stock. His father, Charles Frederick Menninger, was a teacher at Campbell University, a pioneer college in Holton, Kansas, until five years after his (the father's) marriage, when he resigned to study medicine. His mother, Flo V. (Knisely) Menninger, of Pennsylvania Dutch origin, worked as a hired girl in order to put herself through Campbell, where she met and was married to Professor Menninger. After her marriage she taught school, too, and although her husband later became a successful Topeka physician, she continued to teach until before the birth of her third son, William Claire, on October 15, 1899. The story of those years, the couple's early financial struggles and later prosperity, she has recounted in her book, *Days of My Life* (1940).

With his two elder brothers, Karl Augustus and Edwin, Claire, as his mother calls him, had an unusually healthy and happy childhood. There was a clubroom for the boys and their friends on the lower floor of the large house the Menningers occupied in Topeka. There were evenings of singing together around the piano, and a string orchestra in which Karl played the piano, Edwin the violin, and Claire the cello. They were the first family in Kansas to have a sleeping porch, the first to grow peonies, and the first to hold a meeting of Boy Scouts. This third "first" had come about shortly after the organization of the Boy Scouts of America, when the group of boys who played and sometimes camped in the Menningers' large back yard became the nucleus of a Boy Scout troop. Today William Claire Menninger is still actively associated with this troop.

When the United States entered the First World War, nineteen-year-old Menninger interrupted his studies to enlist in the Army, becoming a second lieutenant in the Infantry. When the war ended he returned to receive a B.A. degree in 1919 from Topeka's Washburn College, later an M.A. from Columbia in 1922, and an M.D. from Cornell in 1924. From 1924 to 1926 he then served an internship in medicine and surgery at Bellevue Hospital in New York City. Upon the completion of his internship, young Dr. Menninger joined his father and brother Karl in a psychiatric clinic which they had founded six years earlier in 1920. Charles Menninger had long been convinced of two things about medicine: "first, that physicians should practice in groups so that they could support and complement one another; and, secondly, that the psychological aspect of disease (psychiatry) was the most rapidly developing and important field." The Menninger Clinic, "the psychiatric equivalent of the Mayo Clinic," was based on these principles. William Menninger's first work there was in the field of internal medicine, but in 1927, after postgraduate study in psychiatry at St. Elizabeth's Hospital in Washington, D.C., he began specializing in psychiatry at the clinic. Later, in 1934-35, he attended the Chicago Psychoanalytic Institute for further study of psychoanalysis.

The Menninger Clinic, meanwhile, has had "great influence on psychiatric practice in America." (Karl Menninger, through his books and his articles published in the leading popular magazines, has done much toward popularizing "the most abstruse points of psychiatry.") Since 1930 William Menninger has been a member of the board of directors, medical director of the Menninger Psychiatric Hospital, secretary of the Menninger Foundation, and a member of the editorial board of the monthly *Bulletin of the Menninger Clinic.* Among his other professional duties in Topeka is that of neurologist and psychiatrist for the Southard School for Handicapped Children. To his credit are some one hundred and fifty scientific papers, chief among which is the monograph *Juvenile Paresis* (1936).

The entrance of the United States into the Second World War brought Menninger into the Army in November 1942 as a lieutenant colonel in the Medical Corps. Appointed neuropsychiatry consultant for the Fourth Service Command (the seven Southeastern states) the following year, he soon won recognition for his work. Since his appointment in December 1943 as chief of the Neuropsychiatry Consultants Division in the Office of the Surgeon General, he has directed the expansion of the Army's neuropsychiatric work, "an expansion made necessary by the ever-increasing number of casualties returning from the war front." His personality—"modest, quietly good-humored, warm, frank, and tolerant—together with his pronounced professional ability," wrote Albert Deutsch in *PM*, "has helped him break down many walls of hostility and suspicion against psychiatry that impeded proper treatment of mental cases in military service. . . . Army psychiatry, which was in an almost scandalous state of neglect and confusion in the early months of the war, has been markedly improved under Menninger's efficient handling of the neuropsychiatric division. From induction center to battle station, the soldier has a better chance of being protected against a possible mental crackup and of getting prompt and efficient treatment if he does crack up."

On his return from a six-week inspection survey of the European theater of war in the fall of 1944 Menninger, then a Colonel (a year later he became Brigadier General), stated that he had observed a direct relationship between Army morale and mental hygiene. "When morale is good the rate of mental crackups goes down, and vice versa." To make up for the shortage of trained psychiatrists during the war, Menninger's division conducted special intensive three-month courses for young Army doctors. It also operated lecture programs for doctors so that they could better recognize incipient and actual psychiatric cases, and give emergency psychiatric treatment when necessary.

Menninger, in reporting in July 1945 on the expansion of psychiatric service, stated that at that time there was an outstanding psychiatrist in each of the five large overseas war theaters, a consulting psychiatrist with each army, and a division psychiatrist with each division. In the United States there was a leading Army psychiatrist serving as consultant to each of the nine service commands, and psychiatrists were attached to all Army hospitals. In addition, mental hygiene consultation units had been opened and were functioning in thirty-seven United States training camps. Menninger pointed out also that there was a closer relationship between psychiatry, medicine, and surgery in the army than in most civilian institutions.

One of the most telling arguments for the full-employment bill was made by Menninger in testimony before the Senate Committee hearings on the measure in September. He described the dangerous effects of continued unemployment on family life and on human personality, should the bill be rejected. Chronic unemployment during the last depression affected the mental health of two generations, as the effect on the children of the jobless workers was "beyond calculation." "When a family is plagued with unemployment", he said, "it is impossible to conceive of the children maturing without some degree of warp in their personality structure and, consequently, difficulties in their relations to people and to the community—evidence of mental ill health."

The fact that 39 per cent of all men rejected for military service in the last war—1,825,000 out of 4,650,000—were suffering from some type of personality disorder gives an idea of the emotional end results on "depression kids." Furthermore, 300,000 men had to be discharged from the Army for neuropsychiatric reasons, constituting the amazing total of 43 per cent of all discharges for medical reasons." Still another 130,000 men had been discharged, he said, on an administrative basis because of inadaptability or ineptness. Many of these persons, the psychiatrist pointed out, will have difficulty in obtaining and in holding jobs. "Of all the obligations we owe," he said "none is greater than to our disabled veterans, including the neuropsychiatric casualties." If these men do not obtain work, many of them may become confirmed invalids. In conclusion, Menninger called for a program of maximum employment opportunities plus a social security system that would not affect the morale of the temporarily unemployed but would serve as an insurance against the hazards of wide-spread mental ill health.

In an article, "The Mentally or Emotionally Handicapped Veteran," written for the *Annals of the American Academy of Political and Social Science* (May 1945), Menninger stated that in the postwar world it will be up to each community to develop a mental health department in its public health program to assist veterans with psychoneurotic scars. "Many Army misfits," wrote the psychiatrist, "could have been prevented [the United States Army had a greater number of neuropsychiatric casualties than any other army in the Second World War] if there had been greater use of psychiatric and mental hygiene services in the educational system of the country. . . .Just as our tuberculosis incidence was reduced by long years of public education, so can the frequency of psychoneurotic illness be affected by public education which can be planned and directed by the community agencies and the medical profession. One phase of such education," he suggests, "might be concerned with the change-over of community agency responsibility from charitable welfare to service to all in the area who can profit from its workers' training and experience—for fee as well as for free."

The psychiatrist's professional affiliations include Fellowship in the American Psychiatric

MENNINGER, WILLIAM CLAIRE *—Continued*

Association, the American College of Physicians, and the American Medical Association. He is a member of the American Orthopsychiatric Association, the American Psychoanalytic Association, the American Psychopathological Association, the Central Neuropsychiatric Association (secretary since 1937), the Association for Research in Nervous and Mental Disease, the Central Society for Clinical Research, and the Kansas Psychiatric Society.

His work has not prevented the psychiatrist from following his avocation as a "Scouter." During the period of his internship in New York he served as assistant district commissioner of the Queens Council of the Boy Scouts of America, and following his return to Topeka in 1925 he became Scoutmaster of his boyhood troop. While Scout leader he developed in nine years seventy-five Eagle Scouts, the highest Scout rank. (During his own Eagle Scout days Menninger had qualified for eighty-seven Merit Badges out of a possible hundred offered for Scout electives.) In 1928 he organized a Sea Scout Patrol as an experiment. A year later this patrol was converted into a regular Scout ship, the S.S.S. *Kansan,* which, with Menninger acting as Skipper, was three times awarded first place in nationwide competitions. He has served on the National Executive Board of the Boy Scouts since 1937, and for three years (1938-40) he acted as president of the Jayhawk Council for Boy Scouts. In addition to contributing frequently to the magazine *Scouting,* Menninger has written *Handbook for Skippers* (1934).

Menninger's other non-professional affiliations include membership in the American Ornithological Union, the American Philatelic Society, the Collectors Club of New York, and the American Legion. He is a Mason and a Presbyterian. In 1925 he was married to Catharine Wright of East Orange, New Jersey. The Menningers have three sons, Roy Wright, Philip Bratton, and William Walter. The psychiatrist has been described as "tall, clean, and wholesome, like the wheat of his native Kansas."

MILAM, CARL H(ASTINGS) (mī′lȧm) Oct. 22, 1884- Librarian

Address: b. American Library Assn., 520 N. Michigan Ave., Chicago; h. 2608 Orrington Ave., Evanston, Ill.

The record of the past quarter of a century of the American Library Association has been one of steady expansion. The fact that the organization is the effective body it is today is considered the result of the unifying and directing force of Carl H. Milam, its executive secretary since April 1920.

Carl Hastings Milam, the son of George Lee and Florence Amanda (Burch) Milam, was born in Harper County, Kansas, on October 22, 1884. Upon the completion of his secondary education he entered the University of Oklahoma, receiving his B.A. degree there in 1907. While at the university he had his first taste of library work as a student assistant in the library under Milton J. Ferguson, who was to become chief librarian of the Brooklyn (New York) Public Library in 1930. He liked it so well that immediately upon graduation he enrolled in the New York State Library School in Albany, stopping first in Chicago for a few months of experience in the John Crerar Library. He obtained his library certificate the following year. His first position was as an assistant in the Purdue University Library, Lafayette, Indiana.

Milam was at Purdue for a year, obtaining experience in the organization and direction of library service, then became secretary and State organizer of the Public Library Commission of Indiana. The foundation for his future work in the library field was now being laid. In this position he acquired an understanding of library needs on a state-wide basis. He held this post until 1913, when he took over the directorship of the public library in Birmingham, Alabama. In this capacity, according to Louis R. Wilson (*Library Journal,* April 15, 1945), Milam became acquainted with "the relation of public libraries to the population of a region largely unserved by libraries and confronted with the difficult problems of race relationships." Added to this, Milam's membership on various State committees and on the Council of the American Library Association developed to "a national level" his knowledge of libraries and their various types of service. He was president of the League of Library Commissions in 1912-13.

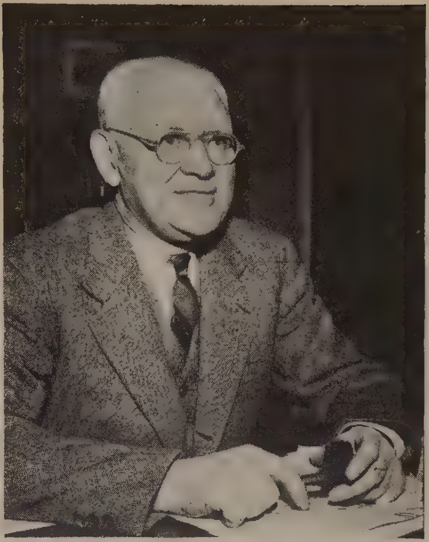
Herbert Putnam, Librarian of Congress, had been appointed director general of the A.L.A. Library War Service, and in October 1917 Milam became his assistant while still retaining his Birmingham library post. In the next three years Milam often came in contact with officials in Washington, contacts later to prove beneficial in his work as executive secretary. He assisted in the collection and distribution of millions of books and in the raising and expenditure of five million dollars for library service to the armed forces. He observed as well as directed "libraries on the march" wherever American soldiers were assigned. "All of which," states Louis Wilson, "served as a training ground for the following twenty-five years of leadership, which have been characterized by his national as well as his international point of view."

Milam succeeded George B. Utley as executive secretary of the A.L.A. in April 1920. At that time the association's "enlarged program" was under consideration. This plan called for the expenditure of three million dollars for the extension of library service and the improvement of existing libraries. Many progressive and farsighted librarians were behind the project. They strove to interest people in the idea, but it was received with little enthusiasm. The scope of the enterprise and the fact that America wanted to settle down to the prewar status was felt to be largely responsible for this lack of interest. Although his first efforts as executive secretary of the A.L.A. met with apparent failure, Milam was not discouraged. To him, the ideas contained in the defeated program were a goal to be attained by America's libraries if they were to justify their position in American life. From that time on he continued to work for their adoption in a modified form, and his efforts have contributed in a great measure to the establishment of the Boards of Adult Education and of Education for Librarianship, the A.L.A. Survey, and the Committee on International Relations. Embodied in these organizations are the aims of the enlarged program, although slightly altered to meet the needs of today.

In his first year of service with the A.L.A. Milam began his campaign to educate the public to the potentialities of library service. In an article written for *Public Libraries* in April 1920, he advocated the preparation and wide distribution of reading courses for adult education, such courses eventually to cover all vocations and reach the thousands who could not hope to have the personal attention of a librarian. He stressed the importance of interesting books on the reading lists. "They must tell enough of the subject in such a way as to entice the prospective student to start the reading course and, so prepared, to keep him interested in completing it." Milam wrote also of the need for the creation of public sentiment that would demand the establishment of libraries in communities lacking such facilities and the adequate financing of libraries then in operation.

In December 1934 Milam advised all librarians to be ready with constructive proposals for the reorganization of library service within their respective states. He was of the opinion, as were many others, that, under the new Federal Administration, changes would take place in the national and state responsibilities of library administration. At that time the executive secretary was far from satisfied with existing library conditions. That same year he decried the slash in library budgets which had been made despite the tremendous rise in the demand for library service, a result of the increase in the number of persons with enforced leisure. The public's opinion of libraries was gradually being lowered because of the depleted book stocks, the less efficient service on the part of overworked librarians, the poor condition of books, and the reduced hours of service.

Still hopeful of educating the public to the importance of "libraries for civilized living," Milam urged the establishment of a system of public and school libraries which would make books and competent guidance in the use of books easily available to every person in the United States. In the October 1934 issue of *School and Society* Milam wrote, "If, as I believe, it is the business of democracy to provide opportunity for individual development to the highest possible levels, then our National Government also has some responsibility for the institutions of education, recreation, and culture." As one method of reaching isolated populations, he suggested the federation or reorganization of public libraries into large systems; the maintenance of these units on a minimum basis by state funds; the cooperation of the Federal Government with the states in planning for their development.



Stadler Studios
CARL H. MILAM

In an address at the Cleveland Public Library in 1938 Milam discussed the public library of the future. Because of the growing importance of pamphlet material, Milam predicted the development of a special open-shelf pamphlet room, presided over by a special pamphlet librarian. He prophesied an increase in music records and music scores, both in quantity and quality, to be available in all libraries; and he foresaw, above all, an expansion of educational services to the public. He advocated that librarians employ subject specialists; open special rooms; and then, through exhibits, posters, newspapers, radio, and moving pictures, stimulate reading interest. When duplicates are needed, he urged that they be purchased by the hundreds or the thousands, if the demand required them, not by the customary threes or fours.

Nor did Milam hesitate to discuss the obvious shortcomings of American public libraries. He stated that they still suffer from tradition. Years ago books were assembled for preservation and for the use of scholars; today, he said, they should be made accessible to everyone. Milam agrees with many of the younger librarians that in order to make the cataloging and classifying of books more useful to the public, the methods should be restudied and improved. And if librarians wish to encourage those who are not attracted by the grandeur and formality of the large library, more thought should be given to architecture, color, and comfort. In his final remarks he recommended cooperation among counties to form regional libraries, a procedure

MILAM, CARL H.—*Continued*

long advocated by many librarians. It is the only method known which will render service to sparsely populated areas. "There are forty million Americans who today have no access to public libraries. Not a healthy situation," he remarked, "for a country which believes in equal educational opportunity for all."

The outbreak of the war in Europe in September 1939 was a danger signal for American libraries to be prepared for readjustment to meet national emergency. In July 1940 Milam, as executive secretary of the A.L.A, outlined special duties for librarians. It was important, he said, for them to speed up book and pamphlet acquisitions to meet new and prospective requests, such as in vocations related to war industries; to help make democracy work by encouraging reading on all current problems; to forego, temporarily, their efforts to obtain well-rounded collections but instead to buy choice books which would be most useful during the war emergency. Moreover, realizing the necessity for an organization which would unite the committees assigned to various phases of war library service, both national and international, the A.L.A. executive board appointed a Committee on International Cultural Relations to study the whole problem of library participation in international cultural cooperation, a project to which Milam has since given much of his time and effort. The librarian believes that the restoration of libraries throughout the world is fundamental to the re-establishment of world intellectual activity, and that a more systematic and thorough interchange of books and journals between countries will increase respect for the nation which produced them. He is confident that the resultant understanding and esteem will contribute immeasurably toward maintaining a permanent peace. As one suggestion to assist in procuring such publications, Milam recommends a revision in copyright, tariff, and postal agreements by the various nations.

For years the executive secretary of the A.L.A. has worked for a closer relationship in library activities with Latin America. He has urged the interchange of library students and librarians in addition to the establishment of library schools and scholarships which will afford a better mutual understanding. In 1939 funds granted by the Rockefeller Foundation made it possible to investigate conditions and plan a program of activities. In 1940 several hundred thousand dollars were expended in the administration of libraries in Managua, Mexico City, and Montevideo, and in the shipment of books to Latin American libraries. Carl Milam and Harry M. Lydenberg '41 of the New York Public Library visited Latin America in the summer of 1944. They had the cooperation of the State Department and financial assistance of the Rockefeller Foundation in making their observations. The recommendations as the result of their study were responsible for the formation of the International Relations Board which now handles the A.L.A. activities related to foreign libraries and librarians from an office in the Annex of the Library of Congress.

Since 1926 Carl Milam has been an officer of the American Association for Adult Education. He is a member of the Cleveland Conference; a consultant to the Joint Army and Navy's Educational Advisory Council; a member of the National Board of Consultants of the Columbia Broadcasting System and of the Liaison Committee for International Education. He has been a consultant of the Division of Cultural Relations of the State Department since 1938 and has worked closely with the Coordinator of Inter-American Affairs. He was a delegate to the first International Library Congress, held in Rome in 1929, and again at its session in 1935 at Madrid. On both occasions he played an important role in the organization and development of the International Federation of Library Associations. He is an honorary member of the Asociación de Bibliotecarios y Bibliógrafos de España and a fellow of the American Library Institute. He is a Congregationalist and a Democrat. His clubs are the Cliff Dwellers (Chicago), University (Evanston, Illinois), and Cosmos (Washington, D.C.).

Of the many characteristics which have contributed to Carl Milam's success, four are said to be predominant: his abundant physical energy; his equally sustained mental ability; his ability to work with others; and his breadth of view. During his term of office Milam has thus far served under twenty-five A.L.A. presidents and worked with twenty-five executive boards. William Warner Bishop considers the executive secretary's constant search for new and unrevealed ability, his insight into possibilities not at first evident, his ability to interpret libraries to persons not engaged in the profession, and his quality of friendliness as his greatest contributions to the advance of librarianship. Bishop also points out that Carl Milam has had much help from other librarians in most of his endeavors, which, he says, is in itself all to his credit: "A lesser man would have tried to do it all himself." On the occasions librarians have disagreed with the policies of the executive secretary, they have been unanimous in their respect for the man and for his work.

In 1910 the librarian was married to Nellie Watson Robinson. They have two daughters, Margery Robinson and Mary Virginia. "Milam is not always to be found in the board room, on the conference platform, or on the national or international front," a writer once observed. "Sometimes he cannot be found at all. He is a fisherman and, once the annual conference is over, he is apt to disappear into some remote region where the fish are supposed to be biting best. If not there, one might find him busily setting out a thousand new trees on his recently acquired farm in northern Illinois."

MILLER, FRIEDA S(EGELKE) Apr. 16, 1890- United States Government official

Address: b. c/o Women's Bureau, United States Department of Labor, Washington, D. C.

The new director of the Women's Bureau of the United States Department of Labor since August 1944 is Frieda S. Miller, former industrial commissioner of New York State's Labor Department. Miss Miller, who in public office has worked for the improvement of labor conditions in both the economic and social aspects, has had an impressive career in labor activities. Frances Perkins '40, when she was United States Secretary of Labor, paid tribute to Miss Miller's work as a practical administrator who understood the economic problems of both New York employers and employees.

Frieda Segelke Miller was born April 16, 1890, in La Crosse, Wisconsin. Her grandparents brought her up after the early death of her father and mother, James Gordon and Erna (Segelke) Miller. In 1911 Miss Miller was awarded a bachelor's degree by Milwaukee-Downer College in Wisconsin. She spent the next four years in graduate work at the University of Chicago, three of them (1912-15) as a fellow in economics. In 1916-17 Miss Miller taught social economy in Bryn Mawr College in Pennsylvania and in 1918 accepted the post of secretary of the Philadelphia Women's Trade Union League, which she held until 1923. In this position she participated in the organization of the Trade Union College later established in Philadelphia, serving as secretary and teaching a number of classes in economics. She had a part also in the founding of the Workers' Education Bureau of America and was one of the original members of the Joint Executive Committee of the Bryn Mawr Summer School.

"I began as a highbrow," Frieda Miller says, explaining that she entered labor activities through the "intellectual back door": "If you're interested in labor problems, you find more interesting material if you go out into the world where those problems exist rather than pondering them behind the protection of a charming campus." Her experiences broadened in the years she spent with the Philadelphia Women's Trade Union League. Young but ingenious, she wore a badge that looked like a state inspector's; she says it helped considerably as she frowningly inspected fire buckets and sanitary facilities.

In the spring of 1923 Miss Miller sailed for Europe as delegate to the International Conference of Working Women which was held in Vienna. She spent a year abroad studying labor conditions in Austria, England, and Germany, where she adopted a German baby named Elizabeth (in 1945 a talented and energetic young woman, a senior at Vassar).

Back in New York in 1924, Frieda Miller worked as a factory inspector and for the fact-finding Joint Board of Sanitary Control of the ladies' garment industry until 1926. Her experiences were further broadened in her survey of the city homes for the aged on Welfare and Staten islands for the New York City Committee of the State Charities Aid (1926-27) and the Welfare Council (1927-29).

FRIEDA S. MILLER

Miss Miller's next post in the New York State labor field came with her appointment in 1929 as director of the Division of Women in Industry in the Empire State's labor department. She served in that capacity for nearly a decade. In the years 1936, 1938, and 1941 she was the United States delegate to the International Labor Organization conferences in Santiago (Chile), Geneva, and New York.

According to the *Christian Science Monitor*, Miss Miller's competence as director of the Divison of Women in Industry marked her as the logical appointee for the position of New York State industrial commissioner to effect the solution of the problem that developed after unemployment insurance benefits became payable in the State in January 1938. When the business slump early that year threw many workers out of jobs, more than half a million claims were filed during the first month. In August 1938 Governor Lehman '43 appointed Miss Miller the second woman labor commissioner in New York State, the first in the post having been Frances Perkins. Climaxing nine years in the State Labor Department, Miss Miller undertook an office which embraced an almost unlimited range of activities, including not only the administration of the State labor and the workmen's compensation laws, but also the acts relating to unemployment insurance, minimum wages, State labor relations, wage claims, and the mediation board. Other ramifications extended to the administration of the laws governing general business, education, domestic relations, civil rights, and social welfare.

Taking the long-range view that the chief problem of the Employment Service was to discover ways and means of conquering unemployment, Miss Miller turned her attention to the problem of re-employment at the same time that she was solving the critical unemployment insurance problem by the decentralized payment plan. As the immediate result of her efforts, placement of men and women in industry increased by 50 per cent in 1939—before defense industries had started rolling. By

MILLER, FRIEDA S.—*Continued*

1940 she had put unemployment insurance in functioning order after a period of two years. In the year 1940 sixty-five million dollars' worth of unemployment insurance checks had been mailed, 98 per cent of them on time.

Throughout her administration a fundamental principle asserted itself: "Labor standards are themselves a basic part of national defense"; reducing labor standards would decrease individual productivity and efficiency. Citing the experiences of industry in Europe and in the First World War, she warned against the lengthening of working hours, except under emergency dispensations in critical war industries.

The passage of the Schwartzwald and Washburn bills gave Industrial Commissioner Miller the authority to enforce the already existing State Civil Rights laws opposing discrimination in industry on the grounds of race, religion, or national origin, by using the powers of administration, investigation, inquiry, subpoena, and hearing. As chairman of the Committee on Discrimination in Employment of the State War Council, Miss Miller was empowered to require the submission of information, records, and reports pertinent to discriminatory practices in industry at any time she saw fit; and in October 1942 she revealed that many employers engaged on war contracts had voluntarily recognized the need for relaxing discriminatory employment specifications, and that "the use of appeal and persuasion by the committee had brought tangible results in some cases and promises of complete cooperation in others."

This 1942 analysis had covered one hundred and twenty employers with nearly two hundred thousand employees who had been investigated by field representatives following complaints by individuals and groups. Although this "implementation for persuasion" applied only to employment in public utilities and in war industries, Miss Miller was not discouraged, believing that public education is far more effective than laws in ending discrimination. "We must make the public understand that it is humanly bad for them to discriminate, that it's bad for their community, that the relief problem is a direct reflection of discrimination."

On December 31, 1942, Miss Miller resigned her office before the incumbency of Governor Thomas E. Dewey '44, who felt that the administration of workmen's compensation had been badly handled. While an investigation by William F. Bleakley and Herman T. Stichman, counsel to Mr. Bleakley, later charged Miss Miller with contributing to the establishment of a "cumbersome bureaucracy," Charles Poletti '43 paid tribute to her: "Both industry and labor attest to your splendid service"; and he also stated that she had met the problems of four and one-half years "with understanding, courage, and intelligence."

In 1940 when she was fast becoming an internationally known expert in labor law administration, Miss Miller had been president of the International Association of Government Labor Officials at the twenty-sixth annual convention in New York. In that year Russell Sage College awarded her an honorary Doctorate of Humane Letters. Then, in March 1943 she was appointed special assistant on labor to United States Ambassador John G. Winant '41 at London. As a result of her English experience, she uses the "buzz bomb" as a favorite simile for the destructive effect of legislation lacking social vision. Miss Miller returned to the United States in the spring of 1944 to play an important role in the I.L.O. Conference held in Philadelphia. One of the significant recommendations of that conclave was the equal-opportunity, equal-pay principle for men and women workers. Miss Miller, herself a strong supporter of this recommendation, believes that passage of the equal-pay measure will not only assure women their rights, but will prevent their becoming "wage cutters and depressors of men's earnings."

In August 1944 Miss Miller went to Washington as head of the Women's Bureau of the United States Department of Labor. She succeeded Miss Mary Anderson, director of the bureau for twenty-five years and long a coworker with Miss Miller in international labor relations. The new director enlisted in a quiet campaign to oppose the proposed equal-rights amendment. Frances Perkins and a number of national women's groups agree with the head of the Women's Bureau that the pending amendment "sounds nice" but would actually "take away from women hard-earned industrial gains which have led to a better standard of living." "No amendment can give women consideration at the hands of the employers who hold the jobs in this country," Miss Miller declares. "It is a matter of prejudice and I have fought that prejudice." During the first ten months of 1945 Miss Miller's Women's Bureau interviewed thirteen thousand women workers, 75 per cent of whom expected to continue work, chiefly from necessity; nine out of ten contribute to the family budget, a substantial number as the only breadwinner. "Their purchasing power," said Miss Miller, "is an inextricable part of . . . national welfare. Their employment is not a war phenomenon, but a long historical development growing out of mass-production techniques. . . .The answer to the question of women in industry should be sought in the direction of a full-employment program."

The most pressing problem facing the Women's Bureau, Miss Miller believes, is the readjustment of women workers during postwar conversion. She urged that women trade union members, housewives in women's civic groups, and Government representatives from both local and Federal agencies should cooperate after the war in solving such problems of community welfare as health, housing, and employment for women. In December 1944 Miss Miller made public a Reconversion Blueprint for Women drafted by representatives of thirty-one national and women's labor organizations. The suggestions included the need for the making of analyses of future job possibilities for women war workers; the establishment of antidiscrimination policies, sufficient public employment service facilities, training and retraining facilities; the advance planning of public works programs; the extension to all states of the collective-bargaining, minimum-wage, and equal-pay for equal-work laws; the extension and improvement of social security measures; the improvement of conditions in major women-employing fields; the analyzing of job shifts; and establishment of seniority rights.

This "mistress strategist of the office and factory feminists" is a robust, cheerful woman with greenish eyes and natural color in her cheeks. She clings to a few old-fashioned tastes: thus her face is guiltless of cosmetics, her long sandy-colored hair remains straight, and she leans to cameos and lace at the throat. Although the emphasis in her career has been in helping women who have sought a livelihood away from home, Miss Miller has typical domestic interests, delighting in experimental cooking and gardening on her ten-acre farm in West Redding, Connecticut. She particularly enjoys sidestroke swimming in her "good little New England pond." Miss Miller is a member of the Academy of Political Science, of the American Association for Labor Legislation, and a Fellow of the American Geographical Society.

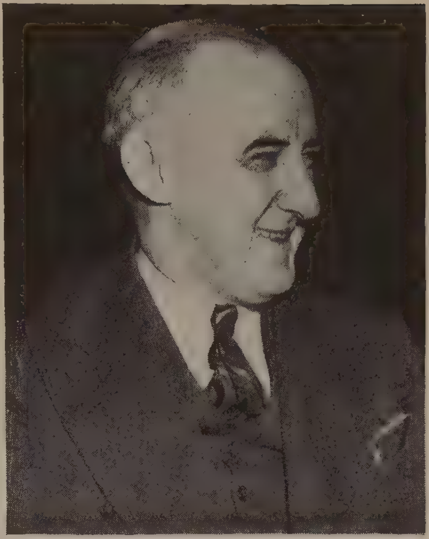
MOLEY, RAYMOND (CHARLES) (mō′ lĭ) Sept. 27, 1886- Editor; author; college professor

Address: b. c/o Newsweek, 152 W. 42d St, New York City; h. 2 E. 55th St., New York City

The associate editor of *Newsweek*, Raymond Moley, is a nationally known editor, writer, teacher, and lecturer. He has taught public law at Columbia since 1923 and is the author of books on government and citizenship, as well as of *The Hays Office* (1945). Chief of the prominent members of President Roosevelt's '42 "brain trust," Moley served as Assistant Secretary of State and mentor to Government officials and agencies during the President's first term; subsequently he became one of the most outspoken critics of the New Deal.

Of French and Irish descent, Raymond Charles Moley was born September 27, 1886, in the small Middle Western town of Berea, Ohio. He is the son of Felix James and Agnes (Fairchild) Moley. After attending the public schools he entered the small Baldwin-Wallace College in Berea, where he received the degree of Ph.B. in 1906. Twenty-year-old Moley then became superintendent of schools for the village of Olmsted Falls, Ohio, a position which he held until 1910. After a siege of tuberculosis had sent him to New Mexico and Colorado for two years, Moley returned to Ohio in 1912 to teach history in Cleveland's West High School, where he remained until 1914. Meanwhile, he studied at Oberlin College and obtained his M.A. degree in 1913. Then he became an instructor and, in 1918-19, assistant professor of politics at Western Reserve University. In that year (1916) he was married to Eva Dall. (The Moleys have twin sons, Malcolm and Raymond, born in 1925.)

Raymond Moley was thirty-two when, in 1918, he became director of Americanization activities, under Governor Cox, for the Ohio State Council of Defense. The following year he took charge of the Cleveland Foundation, and began a five-year survey of organized crime, *The Cleveland Crime Survey* (1922). His work was so successful that he was called upon as consultant for crime surveys in several other states, including Illinois, Pennsylvania and Virginia. During these years Professor Moley published six factual books, one of which, *Lessons in American Citizenship for Men and Women Preparing for Naturalization,* went through ten editions from 1917 to 1930.



RAYMOND MOLEY

In 1923 Moley moved East to become an associate professor of government at Columbia University, where he had received his Ph.D. degree in 1918; five years later he became professor of public law, a position he still holds. At the same time he continued his work in criminology, publishing his findings in *Politics and Criminal Prosecution* (1929); *Our Criminal Courts* (1930), a "most useful" volume which was said to clarify the crime situation and "offer reassurance to those who are beginning to be dismayed by it"; and *Tribunes of the People; the Past and Future of the New York Magistrates' Courts* (1932), which resulted from Moley's study of the magistrates' courts when he assisted Judge Samuel Seabury in an investigation of the tribunals. He has also assisted Seabury in an investigation of the district attorney's office. In 1926 New York's Governor Alfred E. Smith '44 had appointed Moley as director of research on the New York State Crime Commission, on which he served for approximately three years, and in 1930 he was a member of a committee which drafted a model State parole system for Governor Franklin D. Roosevelt. Recognizing Moley's abilities as criminal investigator, Roosevelt appointed him his chief representative on the New York State Commission on Administration of Justice (1931-33).

In that capacity, Moley came into close contact with Governor Roosevelt, whom he assisted in all State matters relating to the ad-

MOLEY, RAYMOND—*Continued*

ministration of justice and criminal law. He was the first of the group of confidential advisers on economics and public policy whom Roosevelt began to gather around him in the months before he received the Presidential nomination. This group, later designated as the "brain trust," soon included, among others, Rex Tugwell '41, Adolf A. Berle, Jr. '40, General Hugh S. Johnson '40, and Felix Frankfurter '41. During the campaign Moley acted as coordinator for the growing group, forwarding to Roosevelt those of the experts' suggestions which merited consideration. Moley is credited with having suggested William Sumner's famous phrase, "the Forgotten Man," and with having originated the term "New Deal" to keynote the campaign.

After the election Moley accompanied the new President to Washington in 1933. There he served as Assistant Secretary of State under Cordell Hull '40 during the famous "hundred days" of history-making legislation, and as liaison officer between Roosevelt and the American delegation to the abortive Economic Conference held in London later that year. In Washington the economist was the brunt of incessant waves of criticism. To accusations that he was an impractical theorist he replied, "I am essentially a conservative fellow," and "I tilt at no windmills." Moley worked hard, and he had a blunt, outspoken manner that often got under the skin of his opponents; practical and realistic, still he was "never so happy as when poking a portly tradition in the nose." Moley had intended to remain only a short time in Washington, and in September 1933 he resigned. However, before leaving Government service he accepted an assignment in the Department of Justice to organize a Federal program for the curbing of racketeering, kidnapping, and other forms of organized crime.

In the meantime Moley had been commuting weekly to New York to lecture to his classes at Barnard College of Columbia University, had been writing a syndicated weekly column of comment for the McNaught Newspaper Syndicate since June 1933, and had been making plans for the launching of a new national weekly magazine. Financed by Vincent Astor, W. Averell Harriman '41, and Mary Harriman Rumsey, this new journalistic venture, *Today*, was to be "primarily concerned with public affairs, independent in its political affiliations, presenting opinion as well as fact, liberal in outlook"—as editor Moley outlined its scope. The first number appeared in October 1933, and within three years the periodical had a circulation of one hundred thousand. Ultimately, early in 1937 *Today* was merged with the magazine *Newsweek*, then merely a weekly digest of news, "in order to incorporate in one periodical signed opinion, a compendium of the news, and an appraisal of the significance of the news," explained Moley. He and his friend Ralph Robey '41 became associate editors of that magazine, each contributing a weekly column of opinion. In 1945 Moley was the main survivor of the original staff, and by the end of that year he had submitted his column of comment every week without a break for twelve years, in six of which he was the only signed commentator.

Between 1933 and 1937 Moley's editorial opinion in *Today* reflected the changing course of his feeling toward Roosevelt and New Deal policies. The backers of *Today* were deeply sympathetic with the objectives of the New Deal, "objectives which we felt any enlightened American government, Democratic or Republican, must strive for," and even after Moley's resignation from his State Department post he did not disappear from the councils of the Administration. During 1934 and 1935 he saw Roosevelt frequently in Washington, and "there was scarcely a message or major speech in whose preparation I took no part," he says. He was also asked to help draft bills, and it was he who suggested the appointments to the Securities and Exchange Commission. As time went on, however, Moley became strongly critical of new Presidential proposals, such as the "soak-the-rich" tax and the plan to "pack" the Supreme Court by enlarging it; he condemned Roosevelt's "less and less neutral" policies, such as breaking off trade relations with Italy, and he admonished him for his dislike of business in general. The man in the street, observed Moley, while he believes in the New Deal, does not at the same time believe that businessmen are all devils, and "we must all see how unsatisfactory, how intolerable the relations of business and government have come to be." He began to view the President as one endowed "with a conviction of personal rectitude that would brook no dissent, suffer no challenge." It was at the close of Roosevelt's first term in office that the erstwhile ardent New Dealer decided to sever completely his relations with the Administration.

In 1939 Moley's criticism of Roosevelt and the New Deal, *After Seven Years*, "an account of political events as I saw them," was published. Based upon his "notes, memoranda, documents, daily journal, and other firsthand material," the volume was published immediately, Moley wrote in his preface, because "an obligation to give to the public that which belongs to the public rests upon anyone who is privileged to participate in public affairs." Most reviewers recognized *After Seven Years* as first-rate writing and absorbing reading and conceded that it is "an important contribution to contemporary political history in its inside phases." It was said also that it was far from being an objective book. Wrote the *Yale Review*: "To read it is to stir your blood; to criticize it is to take sides in a political debate that will last as long as the United States maintains the ballot box." Moley declared in 1945, however, that "no fact in the book has been successfully controverted, and only one fact has been controverted at all."

Moley's weekly column on the last page of *Newsweek*, under the title of *Perspective*, as well as his coast-to-coast lectures and talks and his syndicated newspaper column, have brought him prominence as a political analyst. His syndicated column, distributed through Associated Newspapers, Inc., was begun in 1941. It appears thrice weekly and reaches sixty-four papers, with an aggregate circulation of over six million.

Since the death of Roosevelt Moley has looked with favor upon President Truman '45, predicting that the new Administration would be unfavorable to extremists and that the Democratic Party would swing toward the Right. At the same time he asserted that the Republican Party would show a trend toward the Left. In January 1945 Moley had made news by setting forth, in a speech before the Indiana State Bar Association, a program of "twelve commandments" for the Republican Party to follow. No. 1 was "Stop hating Roosevelt." "Thou shalt not covet Roosevelt's ideas," continued Moley. "It is quite possible to build a set of principles that are progressive and anti-New Deal." Among the other precepts were that party members stop fighting among themselves and try to learn from Sidney Hillman '40 and the PAC how to get out the votes.

Moley became the newest addition to the ranks of radio commentators in March 1945. It was said that the American Broadcasting Company chose Moley for his "middle-of-the-road" stand to offset its other commentators who seemed to "hang a little heavier on the New Deal side because of the predominant audience appeal of [Walter] Winchell '43 and [Drew] Pearson '41." Moley, who is on the air on Sunday evenings, says that he is not a reporter, but that, basically, he will try to explain why things happen and what may logically happen as a result. In October he left ABC, stating that "after six months of lush news there wasn't going to be enough to talk about on the air."

Back in 1936 Moley began collecting material for his history of the Motion Picture Producers and Distributors of America, *The Hays Office,* a volume he completed in 1945. A study of the activities of Will H. Hays '43 since he assumed the presidency of the M.P.P.D.A. in 1922, the book is, Moley wrote in his foreword, "an account of what one industry has learned about governing itself." Expressing unqualified admiration for Hays as a politician and businessman, Moley believes that the Hays Office represents an experience in self-regulation by which business in general can learn how to avoid "the paralyzing hand of government bureaucracy and politics." *Variety* and the *Saturday Review of Literature* rate *The Hays Office* as an objectively written, reportorially dispassionate "capsule history of the motion picture business." The motion picture trade papers, too, received the book with approval, as did most newspaper critics. Some reviewers, however, noted an over-adulatory attitude toward the benefits of the Hays Office. "In short," commented Bosley Crowther in the New York *Times,* "the author has successfully failed to make the dispassionate analysis of the Hays Office that we sorely need."

Twelve years ago Moley was described as "a youngish man of medium height, broad-shouldered, with fat cheeks but no jowls, a low voice, wide forehead, black brows and thinning gray hair." Although he is heavier in figure in 1945, his appearance has changed little. He is said to be an approachable, likable man who laughs easily. While he takes no exercise if he can avoid it, he does like an occasional game of billiards.

MOSHER, IRA (mō'zhẽr) Nov. 15, 1887-
Manufacturer

Address: b. Russell Harrington Cutlery Co., Southbridge, Mass.; h. 56 Everett St., Southbridge, Mass.

The president of the National Association of Manufacturers for 1945, Ira Mosher, is a small businessman, head of the Russell Harrington Cutlery Company in Massachusetts and director of several other organizations. Born in Melrose, Massachusetts, on November 15, 1887, Mosher is the son of Ira and Cordelia (Sweet) Mosher, who had emigrated from St. John, New Brunswick. He is a graduate of the Melrose high school and a school of accounting.

At the age of twenty-six young Mosher became one of the first certified public accountants in Massachusetts. Twelve years later, in January 1925, the C.P.A. became director and treasurer of the Russell Harrington Cutlery Company, a small manufacturing concern in Southbridge, Massachusetts, employing three hundred persons. After another twelve years Mosher, in January 1937, was elected president, a post he has held since that time. In the last years he has also been part-owner. His office has never been a full-time one, however. In addition to it he has held directorships in the Southbridge National Bank, the British branch of the American Optical Company, the McLaurin-Jones Company, the

IRA MOSHER

G. C. Winter Company; the presidency of Canada's Consolidated Optical Company; and he has been treasurer and director of the Better Vision Institute. His principal work, however, has been with the American Optical Company of Southbridge. Since 1922 he has been successively comptroller, treasurer, vice-president, and general manager and trustee of the concern, but in November 1944 he severed all connections to devote more time to his other work.

Mosher had had several other organization leadership jobs before his election as NAM president. In 1941 he was elected president of the Associated Industries of Massachusetts; he served on the NAM's Relation of Government to Industry Committee the same year; and he helped to organize the first regional War Labor Board of New England.

Up until a few weeks before the forty-ninth annual convention of the NAM in early December 1944—when Mosher was chosen to succeed Robert Gaylord '44 in the nonpaying post of president—business leaders had held the optimistic opinion that reconversion would be the most discussed subject before the convention. By convention week, however, it was found that war production still had undisputed precedence. Returning from a tour of the European battlefronts, Frederick C. Crawford '43, chairman of the Association's executive committee, reported that the American industrialist must make an unprecedented number of bombs, shells, and other war materials to win the European war. And from General Brehon Somervell '42, chief of the Army Service Forces, came the warning that production was lagging behind consumption, that, although present shortages were local and largely due to transportation difficulties, the concern was for the future, when battles would become heavier. This, said *Time*, was "the first official word to United States business that cutbacks in war production after V-E Day had shrunk from the 40 per cent which WPB once promised to a slim 15-20 per cent.' "In some confusion," continued the magazine, "the NAMsters hastily armed their full support to the war. Then the ponderous convention machinery, which had been geared up to reconversion . . . rolled on into the postwar world."

One of the most important tasks before Mosher is that of directing the six-point program drafted by the convention. In it, according to *Time*, were generalities against cartels, in favor of free enterprise, good government, a sound currency system, but no mention of a protective tariff for postwar business. The *Christian Science Monitor*'s interpretation of these resolutions is that they say in effect: "Private enterprise *is* the American economic system, and given truly free competition the system would be automatically self-regulating. There should, therefore, be no restriction on regulation of the system, 'except to protect the public health and safety.' Government is instrinsically bad; it is a necessary evil, which should be limited to the performance of its protective functions." The *Monitor* article declared that the "chief trouble with the NAM credo is that it is unrealistic. Private enterprise . . . never has been the whole of the American economic system. . . .Competition has never been altogether free, nor wholly self-regulating, nor self-regulating altogether for the common good. . . .In fact, wholly unrestricted competition implies such a cost in waste and distress that neither capital nor labor has ever been willing to try it out."

To explain how free private enterprise proposes to provide jobs and a higher living standard for all, NAM launched a million-dollar advertising campaign after the convention. The key advertisement, according to *Newsweek*, "called on working men and women to support tax policies that leave sufficient funds for expansion, laws that prevent unregulated monopoly, labor policies that establish responsibilities of both labor and management, and business operation under law instead of under unpredictable Government directive." In speaking of the campaign the financial editor of the New York *World-Telegram*, Ralph Hendershot, wrote: "Association officials are aware that the very best logic in the world presented in the prettiest package will not, of itself, get the job done. . . .If American economic leadership is to be intrusted to businessmen in the future, these leaders must demonstrate by performance that they have what it takes."

Mosher says he is aware that he faces no easy task. "He believes that domestic differences must first be resolved if the country is to win complete victory in the war and be strong enough to contribute to something better than political chaos abroad. In his first public statement he discussed labor relations, saying, "I can only speak for myself, but too many businessmen are content to limit their concern to the four walls of their own plants. It's past time that they got out and talked to people. We'll get understanding the same way we always got it. That's by sitting down and talking things out in the public's interest, not in any group interest. Personally, I'm willing to sit down right now with any recognized labor leaders to work out ways and means of resolving differences to establish an effective, coherent national policy that respects rights and defines responsibilities for both sides."

Following the public announcement that an industry-labor charter designed for postwar unity had been signed on March 28, 1945, by Eric Johnston '43, president of the United States Chamber of Commerce, Philip Murray '41, president of the CIO, and William Green '42, president of the A. F. of L., Mosher stated that he would offer wholehearted cooperation, provided certain points in the code were clarified. He also said, "We must find some way of resolving the issues which divided labor and management in recent years, some way of minimizing the industrial strife which paralyzes production and prevents attainment of true prosperity. . . .The proposed charter is a significant step in this direction. If certain shortcomings can be eliminated, it will provide an important foundation for further progress."

As the May-Bailey bill (amended from a "work-or-fight" to "work-or-else" measure) was being debated in Congress, the *NAM News* said: "Management and labor must solve the problem—manpower—for themselves." (Labor generally is regarded as also being against the bill.) As reported in the *Christian Science Monitor* on February 1, Mosher predicted that the bill would become a "fight-or-work" law "by rewarding conscript workers and penalizing the free workers in our war plants." In another statement he contended that the measure would become the "national slowdown bill."

Mosher has joined with the resolutions committee of the Association in attacking the development of government-sanctioned cartels, and he has urged that Congress consider immediate passage of legislation which will "reflect what the people want." The NAM's attack on cartels, commented *Newsweek* "had the force of novelty," since the question had been "left in the air" by the International Business Conference, the National Foreign Trade Council, and the Bretton Woods conference of 1944. Although the question of protective tariffs was not covered at the convention, Mosher has since stated that he favors "progressively lower tariffs as economic events make them possible."

In May 1945, when the NAM mailed to its membership the reprinted condensation by *Reader's Digest* of Friedrich Hayek's '45 controversial book, *The Road to Serfdom,* Mosher wrote an accompanying letter in which he said, "This condensation will, in my judgment, do much to arm businessmen to effectively analyze the dangers of government planning and the soundness of a system based on individual and free enterprise." In June 1945 Mosher urged the Nation's business leaders to unite in a ten-year postwar prosperity plan, and proposed that delegates from manufacturing, retailing, banking, transportation, the utilities, and other economic interests hold a "National War-to-Peace Council" as soon as Office of Defense Transportation regulations would permit, to chart an all-business postwar program.

Fully realizing the necessity of a speedy reconversion to peacetime production on the part of industry, Mosher declared in a symposium prepared for the New York *Herald Tribune* that reconversion problems were confined to a very small segment of industry, and that, according to an NAM survey, the solving of those problems would not be "as prolonged as the pessimists would have the public think." He added that this survey of more than seventeen hundred NAM companies showed that 61 per cent of manufacturers had practically no reconversion problems, and only 11 per cent of them would require more than thirty days to get started on peacetime production. He concluded: "All that is needed to write a thrilling sequel to the 'Miracle of War Production' is the necessary materials, the go-ahead from Washington and the cooperation of labor." Ten days after the fall of Japan Mosher attended the White House meeting at which representatives of business and labor organizations agreed to participate in a management-labor conference under Government auspices. It was opened on November 5 by President Truman. Philip Murray '41, backed by Henry Wallace '40, pleaded for inclusion of wage increases in the discussions, but Ira Mosher declared that this was not a national collective bargaining conference. At another meeting he said that industry was ready to "forego lockouts and unfair labor practices" but that labor is unwilling to forego "strikes, boycotts" and other "weapons of industrial warfare." Until labor was willing to accept responsibility under the law, he added, there was little hope for real accomplishments at the parley.

As an alternative to the Murray '45 full employment bill, Mosher urged Congress to adopt "a national policy of eliminating special favors and special privileges." This would include vigorous enforcement of antitrust statutes and overhauling of the national labor policy. He outlined the plan in testimony prepared for the House Executive Expenditures Committee, and urged sharp reductions in corporation taxes to a level that would assure a free flow of capital into jobmaking activities.

In June 1912 Mosher was married to Grace Howard. The couple have three sons—Howard, Jack, and Paul, the first two of whom in 1945 are in the armed services. In Southbridge Mosher serves as trustee for the YMCA and the Universalist Church, and he takes an active interest in the Southbridge Manufacturers and Merchants Association. His greatest source of relaxation is found working in the machine shop he has built in the basement of his old-fashioned house in Southbridge. He also owns a house in the woods near the Connecticut border. "Both he and his wife are familiar figures on the golf course, and they frequently entertain week-end groups in their summer home." Mosher is described as being "chunky" and as having sharp features, bushy black eyebrows over rimless glasses, and a wide smile. He is considered forceful and blunt-spoken, and a good mixer. "Business associates," reports *Newsweek*, "rate him as a keen, quick-witted, aggressive executive, bubbling with ideas."

MUNSEL, PATRICE (mŭn-sĕl′ pătrēs′) May 14, 1925- Singer

Address: b. c/o Hurok Attractions, Inc., 711 Fifth Ave., New York City

The "baby coloratura" of the Metropolitan Opera is Patrice Munsel, who startled the musical world in December 1943 with her debut at the age of eighteen. "Princess Pat," as she is affectionately called, began her swift flight to operatic stardom when she won a Metropolitan contract on the *Metropolitan Auditions of the Air* only a few months before her debut. Since that event she has sung leading roles in the world's greatest opera house and has won an even larger audience through her appearances on the concert stage and on radio programs.

PATRICE MUNSEL

The Metropolitan's youngest singer was born Patrice Munsil on May 14, 1925, in Spokane, Washington, the only child of Dr. Audley J. and Eunice Munsil. Her father is a successful Spokane dentist, and her mother, who is her constant companion, is musically inclined and plays the piano. Patrice attended Lewis and Clarke High School, where she was captain of the girls' football team and star of the school's theatrical productions. Not so long before her Metropolitan debut she was singing the lead in the high school's version of Gilbert and Sullivan's *The Pirates of Penzance.* The athletic schoolgirl took ballet and tap-dancing lessons and also studied "rhythmic whistling." Before she studied singing seriously Patrice was a "virtuoso at artistic whistling" and she now claims that whistling was valuable in her singing career for the training it gave her in breath control and phrasing. At twelve Patrice began taking singing lessons with Charlotte Gramis Lange and Mrs. Paul Kennedy. Her voice soon attracted attention in Spokane, and it was suggested that she sing for Vladimir Bakaleinikoff, associate conductor of the Pittsburgh Symphony Orchestra. Bakaleinikoff, who was then in the West, was greatly impressed with the young girl's voice and advised intensive study. Her mother therefore took her to New York for lessons, but after two months they decided they had been premature in their plans—the adolescent voice was not yet ready for professional development. Two years later the sixteen-year-old girl and her mother were back in New York, embarked on a rigorous training schedule for the young singer. Miss Munsel still adheres to this program, which includes voice lessons with William Herman and Renato Bellini, acting and Italian with Antoinette Stabile, French with Maria Savage, and coaching in operatic roles with Giacomo Spadoni.

Opera News reports that it was Spadoni who brought his young pupil to the attention of Wilfred Pelletier '44, program conductor of the *Metropolitan Auditions of the Air.* Miss Munsel entered the *Auditions* and in the finals in March 1943 sang the "Mad Scene" from *Lucia di Lammermoor.* As the youngest winner in the history of the radio series, Miss Munsel attracted special notice in the press. Her prize in this operatic contest was a thousand dollars and a silver plaque, in addition to the cherished contract with the Metropolitan. The Spokane soprano thus was the youngest singer ever signed by the Metropolitan and the second youngest of operatic debutantes, only the famed Adelina Patti having made her debut at an earlier age. But there were still new triumphs in store for Miss Munsel. She received another thousand-dollar award from a fund established for the education of young singers by the late Madame Anna Schoen-René. Then, in November 1943 she signed a contract with S. Hurok '41 for a minimum guaranty of one hundred and twenty thousand dollars for concert appearances during the following three years. (About this time the young star changed the spelling of her name to "Munsel" to simplify the pronunciation.) There were radio and film offers which the aspiring singer refused in order to sing at the Metropolitan.

Before her much-heralded debut at the Metropolitan Opera in 1943, Miss Munsel went home to Spokane in June to give her first professional concert. The recital, a benefit for the Red Cross, was a great success. It was considered a civic event in the star's birthplace, being described as "unique in the history of that city." Miss Munsel later repeated this concert for a large soldier audience, which accorded her a warm reception. Before leaving Spokane she was made honorary Base Commander of Geiger Field, in Washington, by courtesy of the commanding officer "in recognition of her musical achievements and her devotion to her country and the armed forces." Since then the singer has frequently entertained servicemen, singing operatic as well as the lighter popular music.

Patrice Munsel's first professional engagement with an orchestra came in August 1943 in Salt Lake City, where she sang with the Utah State Orchestra and drew flattering press reviews. In the fall Miss Munsel was back in New York preparing for her operatic debut, an event keenly anticipated by the operatic world. In her few years of musical study the soprano had mastered ten operatic roles. But for her debut she had to learn a new role, that of Philine in *Mignon*. On December 4, 1943, the self-assured young girl sang grand opera for the first time from the stage of the Metropolitan. She was an immediate favorite with the audience, her rendition of the aria "Je suis Titania" provoking an eight-minute ovation. However, she did not fare so well with the critics, most of whom considered Miss Munsel miscast in the sophisticated courtesan's role. Several critical reviews noted the newcomer's dramatic ability, poise, and vocal agility, at the same time contending that she was not yet ready for the Metropolitan. Virgil Thomson's '40 review in effect summarized the general opinion: "Miss Munsel, though a young woman of phenomenal talents, is far from being prepared for present glory."

Soon after her debut Miss Munsel again sang in *Mignon*, this time for a high school audience at a Junior Performance of the Metropolitan Opera Guild. On this occasion the youthful star remarked: "It thrills me no end when my own age group burst out in whistles and cheers, yet there is nothing in the world to compare with the feeling I get when I hear the 'bravos' of that wonderful Metropolitan audience." Since her appearance in *Mignon* Miss Munsel has sung other leading coloratura roles. Her second part was the mechanical doll Olympia in *Tales of Hoffmann*, which was followed by the role of Gilda in *Rigoletto*. As Gilda, she was considered lacking in operatic technique and consistent vocal quality. When the young prima donna sang the title role in *Lucia di Lammermoor* the critics pronounced her immature for this taxing role, which has been sung by such notables as Melba, Galli-Curci, and Pons '44. Her voice was called "schoolgirlish" by some, while her musical intelligence and natural stage presence were commended by others. The New York *Post* critic declared that her voice was much more lovely in quality than it had been the previous season, and that she handled it much better. "It is a large voice for a coloratura," the reviewer continued, "and happily much more emotional in quality than the usual bird imitation characteristic of so many voices of this type."

In December 1944, in *The Barber of Seville*, the "baby diva" earned her most favorable critical comments. In the comic Rossini opera, the critics found the soprano very acceptable and decidedly promising. The critic of the New York *Times* called the performance "by far the most proficient singing of her Metropolitan career so far," and Jerome D. Bohm in the New York *Herald Tribune* spoke of the singer's "native vocal flexibility and wide range." Miss Munsel's rendition of the famous aria, "Una voce, poco fa" was especially singled out for praise of its brilliance. On March 1, 1945, the soprano sang the difficult role of the Queen of Shamakhan in Rimsky-Korsakoff's operatic fantasy, *The Golden Cockerel*, presented by the Metropolitan for the first time in English. A later part was that of Juliet in the Metropolitan's revival of Gounod's *Romeo and Juliet* in December.

The soprano in early 1945 started out on her second concert tour, with an itinerary of thirty cities, of which one was Chicago. C. J. Bulliet of the Chicago *Daily News*, in reviewing Miss Munsel's rendition of the spectacular and difficult "Echo Song" by Eckert at one of her early concerts, observed that the work illustrated as well as anything could the singer's merits and defects: "Her merits are overwhelmingly in the ascendant—a voice with a warm and human charm duplicating the incomparable witchery of her magnetic personality. . . .Her defects are the defects of youth and inexperience. She hasn't quite mastered her miraculous native talents. . . .Patrice's voice is one that may cause her to be pursued through life by critical purists. But such purists will indicate that she has other attainments so rare that the attention she gets will be tribute to her challenging personality."

Miss Munsel enjoys concert work and finds travel exciting. In addition, since August 1944, replacing Gladys Swarthout '44, she has been the featured artist on the *Family Hour* over the Columbia Broadcasting System. In March 1944 the *Cavalcade of America* program presented a radio adaptation of Patrice Munsel's biography entitled *Song From Spokane*. In the Second Annual Radio Poll, conducted by *Musical America*, Miss Munsel ranked among the three most popular woman singers for 1944-45. Miss Munsel has a contract with RCA-Victor for a series of recordings. (The Victor *Record Review* considers her voice "unrivaled for thrilling precision and clarity.") In 1945 she is also under contract to Warner Brothers '45. Miss Munsel still works and studies, guided by her mother who keeps shorthand notes of the instructions of directors to aid her daughter in studying her operatic roles. The energetic singer can sing high G in alt above high C in practice, but in performances she has not sung higher than F above high C.

This slender young woman stands five feet five and a half inches tall and weighs one hundred and nineteen pounds. She has large deep-brown eyes, and her oval face is framed by shoulder-length dark hair. Her brunet beauty has been pictured prominently in the press, and her flashing smile has graced the cover of *Life*. She is a fun-loving, vivacious girl, fond of sports, especially skiing and riding. Her favorite drink is a chocolate soda, and like most of her contemporaries she likes boogie-woogie music and dancing.

MURRAY, JAMES E(DWARD) May 3, 1876- United States Senator from Montana

Address: b. Senate Office Bldg., Washington, D. C.; h. 321 Broadway, Butte, Mont.

James E. Murray, proponent of many progressive measures, has been less well known to the general public than his fellow Senator from Montana, the anti-New Deal Burton K. Wheeler '40. But during recent years the Democratic Senator Murray has come forward as the sponsor of much of the Administration's most far-reaching legislation. Emerging as the protector of small business, he has had a firm hand in such important matters as war contracts termination, surplus property disposal, and the extension of the social security system. At least two of his major projects—a bill for the independent development of the Missouri Valley Authority and the full employment bill of 1945—have been called "foundation stones in the postwar plans of Left-wing Democrats."

JAMES E. MURRAY

James Edward Murray was born in Canada, near St. Thomas, Ontario, on May 3, 1876. His parents were Andrew James Murray and Anna Mary (Cooley) Murray.. In 1897, when the Murrays moved to Butte, Montana, the boy's uncle, a wealthy miner for whom James was named, sent him to New York to study law. The young Canadian became an American citizen and took his LL.B. at New York University Law School in 1900, his LL.M. a year later. He then returned to Montana and, settling down under the wing of his colorful and influential uncle, proceeded to build up a comfortable law practice.

Murray's first elective office was that of county attorney of Silver Bow County (1906-08), to which he was elected at thirty. For the next two decades Murray lived a quiet life: To the citizens of Montana he was "a comparatively drab figure," while his uncle remained the outstanding Murray of the State. It was not until 1933 that he again entered the political scene, becoming chairman of the State Advisory Board for the PWA. On November 6, 1934, Murray was elected to the United States Senate to fill the unexpired term of the late Thomas J. Walsh. With little opposition, he was re-elected for the 1936 and 1942 terms. A faithful New Dealer, during these years he backed the majority of the Administration's legislative measures, and soon became known as one of the most progressive Senators.

In the early months of 1941, when problems of national defense became a paramount concern, Senator Murray, as head of the Special Senate Committee on Small Business, became the champion of these small enterprises in their competition with big business for the major defense production contracts. In September 1941 he asked for an appropriation of one million dollars to study their problems. For some months things moved slowly for the Murray Committee. But by the end of 1942 small business found a firm backer in Donald M. Nelson '41, chairman of the War Production Board, who assured Murray that the WPB sub-agency, the Smaller War Plants Corporation, would make a number of surveys.

The Murray Committee was able to bring to light, in December 1943, examples of discrimination against small business when General Brehon Somervell's '42 Services of Supply overloaded large plants with its orders but overlooked the facilities of small companies "crying for a part in the war program." The Anaconda Wire and Cable Company was particularly named by Murray—the company had been charged with supplying defective communication wire to the Army and was also seen as opposing the Government through the many newspapers it owned in Montana. (The former charge was dealt with by the Department of Justice's War Frauds Unit under Tom C. Clark '45.)

Early in 1943 Senator Murray warned that growing giant corporate monopolies would lead to "a complete abandonment of free enterprise and the building in its place of a totalitarian system like that of Germany" unless something were done to "tide smaller firms over the war period." Although the Smaller War Plants Corporation Act, devised to aid smaller companies to get war contracts, was finally passed, Senator Murray charged a lack of coordinated aid to small business bungled the whole problem. In 1944 the SWPC was renamed the Small Business Corporation.

The Montana Senator in July 1943 introduced his war contracts termination legislation, terming this "one of the prime tasks before the present session of Congress." His bill provided for permissive loans by the Government up to 75 per cent of a contractor's claims at the time his contract was canceled. There was, however, considerable pressure for redrafting, and Murray came forward with a recommendation for an "omnibus" war contracts termination law.

On February 22, 1944, Murray joined with conservative Democratic Senator George '48 of Georgia to introduce into Congress an industrial demobilization bill which embodied some of the Baruch '41-Hancock plans for terminating war contracts, together with disposal of surplus Government property. The Murray-George bill was passed by the Senate on May 4. Harley Kilgore '41 of Virginia in turn offered an amendment (which the Senate rejected) to establish a central planning board, and fought to get the Senate to consider such "human" things as unemployment compensation for workers who lose jobs when contracts are canceled. Foreseeing the possibility of "nineteen million idle" at the close of the war, Murray urged that legislation meeting the best features of both proposals be enacted at once. But the new Kilgore-Murray bill, drafted in August was defeated by supporters of the George bill, the latter advocating not Federal but state-controlled compensation plans. Kilgore, however, supported by Murray, reintroduced his bill into Congress in July 1945.

Tied in with all this was the problem of the disposal of many millions of dollars in surplus war properties. Murray explained that the Small Business Act of 1944 was devised to authorize the Small Business Corporation to "acquire these surpluses for disposal through it to small concerns." A bill providing for civilian rather than military control over surplus properties was introduced in August 1944 by Senators Murray, Steward, and Taft '40. The bill would further empower the Attorney General to prevent sale of plants to monopolies. But a deadlock soon arose between the Murray supporters and Presidential right-of-center advisers, including "assistant president" James Byrnes '41 and Baruch. In 1943 Will Clayton '44, Southern "cotton baron," had been named Surplus Property Administrator. At that time the Murray-led liberals had succeeded in passing a bill that would provide instead for a three-man board, which Clayton called unworkable. But when it was reported that Clayton, backed by Secretary of Commerce Jesse Jones '40, had moved to place on the board men who had "big business" interests, Murray warned the President that such appointments would be a betrayal of the New Deal, and the Jones-Clayton appointees were ruled out. In January 1945 Murray's Small Business Committee was liberally represented on the newly created Surplus Properties Board. Public hearings for disposal of approximately two hundred billion dollars' worth of surplus were held by the Murray Committee, and the scramble to negotiate acquisition of large Government war plants began.

Shortly after the defeat of the Murray-Kilgore bill, the Senator from Montana turned his attention in September 1944 to President Roosevelt's '42 request for early legislation to create a Missouri Valley Authority for most of the country west of the Mississippi, to be patterned after the Tennessee Valley Authority. The proposed legislation for the MVA was opposed by the Army Engineers (who are in charge of river and harbor work) and the Reclamation Service, and the lameduck Congress of November tried to scuttle the Administration's plan for an independent MVA by introducing piecemeal legislation. But on November 28 the Senate voiced unanimous opposition to a substitute plan for turning the river's resources into various projects favored by Western states.

Early in 1945 Murray introduced a revised bill for the MVA, the project to affect large areas in Missouri, North and South Dakota, Nebraska, Iowa, Kansas, Montana, Wyoming, and Colorado. "The full development of the resources of this great region," he said, "might well rank as the most important national development since the Louisiana Purchase. But Vice-President Truman '45, although a Missourian, committted the bill to the Senate Commerce Committee, headed by Josiah Bailey '45, who was known to be opposed to Government-owned power projects. Secretary of the Interior Ickes '41 further complicated matters by proposing that the MVA be put under control of the Department of the Interior. By September 1945 a strong lobby, said to be "the first large-scale power lobby since the National Electric Light Association, controlled by the Samuel Insulls," was doing everything possible to defeat the MVA bill. A national association of electric companies, representing a large number of private power companies and the utility holding company interests, was heading the lobby, aided by the Mississippi Valley Development Association and the National Reclamation Association. President Truman, in the meantime, had come out in support of the bill, and thousands of residents of the states affected had petitioned Congress for its early passage.

It was in connection with a bold program for postwar security in America that the name of the Montana Senator began to appear most often before the public. Jointly with Senator Robert Wagner '41 of New York and Representative John Dingell of Michigan, Murray on June 3, 1943, introduced into Congress a bill designed to eliminate the economic hazards of unemployment, sickness, and old age for every American. It would extend the social security system to fifteen million citizens not yet covered, broaden old age and unemployment benefits, and set up medical and hospital insurance to cover all workers and their families.

The bill's most popular feature—and the one also subject to most attack—was the proposal of a broad Federal system for postwar medical and hospital insurance for all. This program would be financed by setting aside one fourth of the total social security collections under the proposed system—an estimated two to two and a half billion dollars a year. Among its provisions were: Each person would be entitled to choose his own doctor; doctors would be free to go in or stay out of the plan, and those who went in would be free to select their patients; doctors would be paid from the insurance fund; hospital care would be limited to thirty days a year, and include all illnesses except tuberculosis and mental cases. While the program for medical care received the immediate support of some organizations, strong opposition came from the powerful American Medical Association and certain large commercial interests. In a series of speeches in November 1943, Senator Murray charged these groups with "waging a political fight" to destroy the health provisions of

MURRAY, JAMES E.—*Continued*

the proposed social security plan. "It is tragic," he said, "that a bill introduced solely in order to bring more adequate medical care to all the people in the United States should be so misinterpreted by a group which professes to represent the medical profession."

For more than a year the Wagner-Murray-Dingell bill lay in committee, receiving no hearings. Then, with the drafting of a new bill in April 1945, further provisions for national health were made in a program to meet practically all family medical costs except the purchase of patent medicines. Dental care was included, and provisions made for grants to states for maternal and child-health service, and for the extension of health insurance to independent farmers, professional persons, and small businessmen, although the measure was attacked as one aimed at "centralization and socialization of the Federal Government." In November a five-point national health program, including the first plan for compulsory health insurance in the history of the United States was presented to Congress by President Truman. Bills by Senators Wagner and Murray were immediately introduced in the Senate to support the President's recommendations. The bills were again sharply attacked by the A.M.A. It unanimously adopted a statement which declared that positive proof existed from experience in other countries that inferior medical service resulted from compulsory health insurance.

In December 1944 the War Contracts Subcommittee of the Senate Committee on Military Affairs, with Senator Murray as chairman, had drawn up a basic plan for far-reaching legislation intended to guarantee a job for every employable American after the war. The program, designed to provide sixty million postwar jobs (the figure cited by President Roosevelt in a campaign speech), came to be called the full employment bill of 1945. Cosponsored by Senators Wagner, Elbert D. Thomas '42, and Joseph C. O'Mahoney '45, it was introduced by Murray into the Senate in January 1945. The bill would set up a "new type of budget to carry out the policy of necessary investment and expenditures—a national production and employment budget." Each year the President would furnish Congress with an estimate of the number of persons willing to work for whom employment would be needed; an estimate of the total investment of and expenditure by private business, state, local, and Federal governments needed to provide this employment; and an estimate of the amount of such expenditure in prospect. If, when his suggestions were accepted, there was still prospect of unemployment, he would be directed to offer a program of public works. A joint committee of the House and Senate would be set up to study the President's proposals so that Congress would be prepared to take action before a depression came. "This is not just a bill to take up the slack through public works," said Murray. "It is founded on the premise that we can't just sit around and wait until people are out of work before we do something about promoting employment." The legislation looked toward the cooperation of industry, agriculture, labor, and state and local governments for the free competitive enterprise which would provide full utilization of the country's resources.

Early hearings on the full-employment bill were promised. But the measure, called the "fool employment bill" (*Newsweek*, June 18, 1945) by its opponents, brought forth considerable attack from the supporters of big business. The *Saturday Evening Post* called it "The Sixty-Million-Jobs Myth." Others said it was an "undemocratic" move: "No democratic government can manage the national economy and remain the government of a free people." Anti-New Dealers saw in the bill the beginning of a "new" New Deal for the postwar period. Senator Murray, for his part, warned business leaders against adopting the position that business needs and wants a floating number of unemployed in order to operate "to the better advantage of business." America cannot survive, he said, unless "business wholeheartedly adopts the goal of jobs for all who are able and willing to work."

Strong support for the bill came with its endorsement in June by War Mobilization Director Fred M. Vinson '43, known as a conservative Southern Democrat. President Truman, who as a Senator had been on the Murray subcommittee which originated the bill, could be counted on, it was said, to make it one of the major objectives of his Administration. "Virtually every Government agency dealing with labor and postwar economic problems, as well as the A. F. of L and CIO, stood behind the full employment bill. It was passed by the Senate late in September 1945, but only after it had been amended to read that any expenditure "shall be accompanied by a program of taxation . . . to prevent any net increase in the national debt." When the Attlee '40 Labor Party won in Great Britain, Senators Murray and Wagner declared that it was the unemployment issue that contributed to the political upheaval in Britain and "turned it toward socialism."

During 1943, 1944, and 1945 Senator Murray had lent active support to other Administrative progressive legislation. He urged that the Government take the public into its confidence in planning price control and rationing. The enactment of a bill to take the Office of Civilian Supply away from the WPB and establish it as an independent administration was seen as a victory for Murray's Small Business Committee. During the debate over Secretary Stettinius' '40 selections for his State Department staff, Murray approved all except Will Clayton. He led the opposition against the Social Security Tax freeze which the Senate passed in December 1944. In January 1945 he introduced, with Senator Wagner, a bill to liberalize the unemployment sections of the GI Bill of Rights. In March he introduced a bill to prohibit large tire manufacturers from distributing their products through company-owned outlets. In April he suggested the use of idle textile mills in France to help take care of the huge Army textile requirements. Throughout the war years he assailed as "traitors" those who he said were "trying to strike terror into the hearts of our people with false tales about Russia's plan to communize the world and desert the United Nations." He cosponsored a resolution to persuade Great Britain to allow establishment of refugee centers in Palestine, and declared in regard to developments there in the fall of 1945, "There is hardly another instance in the memory of our generation where promises have been so lavishly made and so consistently violated." At a dinner given in New York for Yugoslav relief, he lauded Marshal Tito '43 as a "great leader." In early 1945 he headed a committee of nationally known Catholics to urge the Big Three at their conference to discuss a world-wide ban on racial discrimination.

In January 1945 he succeeded to the chairmanship of the Senate Committee on Education and Labor. He reported at that time that organized labor was not asking for any new legislation on its own behalf. In May 1945, as chairman of the Small Business Committee, Murray ordered a broad study of labor-management relations, including the question of consolidating the Government's scattered labor agencies. Hearings were scheduled for June to discuss in particular the role of labor organizations as related to small business. It was on May 23 that the Senate Committee on Education and Labor voted for the Chavez bill to establish a permanent statutory Fair Employment Practice Commission to succeed the wartime FEPC created by President Roosevelt in 1941. New work loomed before the Labor Committee when, in June, stiff labor opposition rose against the new Ball '43-Burton '45-Hatch '44 bill for a proposed Federal industrial law. Murray was also a supporter of President Truman's plan to establish fact-finding boards empowered to make recommendations in major labor disputes. Murray has consistently opposed any further extension of the draft and has frequently gone on record for repeal of the Act passed in 1940. When the question of further investigation of the Pearl Harbor situation was brought up in the Senate in the autumn of 1945, Murray lead the opposition.

James E. Murray is said to be one of the wealthiest members of the Senate. His thin, sensitive face, with a broad brow, is offset by a determined mouth and chin. He has been described as "a soft-spoken, gentle, and modest (one might say shy) soul utterly devoid of the bluster and brass one finds on Capitol Hill." Another writer has said, "You catch an angry glint in his eye and a firmer set to his jaw" when he fights opposition to the social measures he has sponsored. Murray was married in 1905 to Viola Edna Horgan; they are the parents of five sons: James, William, Edward, Howard and Charles. The youngest son, Charles, who is an economist and secretary to the Senate Labor Committee, is said to be "the chief confidant of his father, who makes few decisions without consulting him."

MYDANS, CARL M(AYER) (mī′dȧns) May 20, 1907- Photographer; journalist

MYDANS, SHELLEY SMITH May 20, 1915- Journalist; author

Address: b. c/o Time, Inc., 9 Rockefeller Plaza, New York City

In June 1938 *Life* Magazine's first photographer-reporter team was formed by the marriage of two staff members, Carl M. Mydans, photographer and reporter, and Shelley Smith, researcher and writer. Throughout the war the Mydans, working jointly or independently, reported in words and pictures from almost every fighting front. And as internees in the Santo Tomás camp in Manila, and in the Shanghai International Settlement, for twenty-one months in 1942-43 they experienced another phase of the war, as prisoners of the Japanese. The story of these months has been told in novel form by Shelley Smith Mydans in her book *The Open City* (1945).

Alfred Eisenstaedt

CARL M. MYDANS

The son of David J. Mydans, an oboist, Carl Mayer Mydans was born in Boston on May 20, 1907, eight years, to the day, before the birth of his future wife and co-worker, Shel-

SHELLEY SMITH MYDANS

ley Smith. A native of Palo Alto, California, she is the daughter of Everett W. Smith, professor of journalism at Leland Stanford University. After being graduated from Boston University in 1930 with a B.S. in journalism, young Mydans spent the next five years on the city desks of various newspapers and, during the major portion of this period, as news editor of the *American Banker*. An enthusiastic photographer, the young editor spent his leisure time improving his technique, and in 1935 he became a photographer for the United States Resettlement Administration.

Unlike Carl Mydans' early training, Shelley Smith's preparation for a career was no springboard to her journalistic future. Eager to be a dancer and an actress, she was for a while a member of a stock company in San Francisco, before going to New York to pursue her career on Broadway. But, as circumstances would have it, she went to work instead as researchist for the now defunct *Literary Digest*. Meanwhile, a year before she was to transfer to *Life*'s research staff, Carl Mydans joined *Life* as a photo-reporter. Mydans' peacetime assignments were unusually scattered: photo-reports on Hollywood studios, sailors in submarines, Mexican cattle ranches, transcontinental trucking, High Mass at St. Patrick's Cathedral in New York City. Then, at *Life*'s Christmas Eve party in 1937, Mydans and Shelley Smith were introduced, and six months later (June 1938) the couple were married. For the next two years Mrs. Mydans worked in *Life*'s New York office, while her husband carried out assignments in the field.

At the outbreak of war in September 1939, the Mydans were sent to Europe as correspondents for their magazine. The couple didn't reach Paris till the latter part of October because of an emergency appendectomy Mydans underwent in Bermuda, their first stop en route. France, still in the deceptive "phony" state of war, was not an exciting spot for correspondents eager for action, so the team left for England. In December Carl Mydans set out for the Finnish-Russian front, while his wife went to Sweden. For two and a half months Mydans photographed, in sub-zero weather, the hardships of Finnish civilians during Russian bombings, the Kemi River battlefield, Viipuri under fire. The cold was so intense that he carried two cameras inside his sheepskin coat, alternating their use so as not to expose one camera too long to the cold. Says the photographer: "Pictures lay at every glance, but never have I suffered more in getting them."

Joining his wife in Stockholm, he next photo-reported an article on Sweden's possible course of action in the event of a German invasion. After a short stay in London, Mydans then returned to the Continent to cover the capitulation of France in June 1940. Coincidental with his stay in Paris, was Shelley Mydans' assignment in Portugal, where she collaborated on an article with *Life* photographer Bernard Hoffman. A few days before the Germans entered Paris, Mydans and his colleagues of the *Life-Time* staff started south for the Spanish border. Mydans' repeated attempts to photograph the panicky exodus of civilians to the south were frustrated. Frenchmen, angry, frightened, and tired, found a ready-made scapegoat in this reportorial staff of twenty-five Americans and Britishers. The people shouted "Capitalist robbers" at *Life*'s automobiles; the Britishers were refused service at restaurants; some of the staff, including Mydans, were mistaken for German parachutists and almost hanged; and when Mydans photographed a group of Frenchmen at a gas station he was mobbed by the crowd and rescued only by the intervention of a soldier attached to *Life*'s employees by the French Ministry of Information. The staff finally reached Lisbon on June 24 and boarded a clipper for the United States.

Back in the States, Shelley Mydans was assigned to the National Defense Departments of Time, Inc., in New York and Washington, D.C., while her husband, after two weeks in Washington, embarked for Hawaii. Two months later he covered maneuvers of the Pacific Fleet, then headed for Mexico to report on the inauguration of President Avila Camacho '40. While in Mexico, Mydans was attacked by an anti-United States, anti-Camacho mob.

With the Far East their next joint assignment, the Mydans left California in December 1940 on the S.S. *President Taft*. Leaving the ship at Hong Kong, they continued by plane to Chungking. In an article in *Life* entitled "The Backwoods Capital of China," they described the Chungking of 1941 as a blockaded city filled with poverty, dirt, and disease, but inhabited by an undaunted people. According to the Mydans, "It must be discouraging to the Japanese to see China make great strides in health, education, and modern living under the steady rain of bombs. . . .And it must cause consternation in Tokyo to realize that if a Chinese farmer's house is destroyed by a bomb, and his horse and pig killed, the collected metal of the destructive missile will pay for a new home, horse, pig, and set him up anew."

Life in China was hard for the Americans, too, becoming more unsafe for the Mydans with the gradual destruction of their hotel by bombings, but Carl Mydans kept right on photographing, in the sweltering heat, life in wartorn China. From Chungking the couple headed for Singapore on a photo-reporting assignment embracing the social, economic, and military conditions of the British colony. Following their return to China, they visited the Yellow River front, Chengtu, Langchow, and Sian, then turned eastward to Hong Kong.

In these travels through the Orient prior to the bombing of Pearl Harbor, the Mydans found Japan's efforts at fraternization under the banner "Asia for the Asiatics" almost ineffectual, reactions varying with the locality. Inhabitants of the hot regions of Malaya, Java, and Sumatra were less antagonistic to Japanese rule than the subjugated peoples farther north. But, contended Mydans and his wife, in the long run, Japanese slogans and sporadic gestures of good will would be outweighed in all the conquered areas by the hunger and maltreatment they brought.

In September 1941 the couple flew from Hong Kong to Manila to gather information on the defenses of the Philippines. They wrote two articles—one on Corregidor and one called "Defenders of the Philippines." The latter, illustrated by Mydans' photographs of the United States Army's preparations for the defense of the Philippines, was based on Shelley Mydans' research. Traveling on the last clipper leaving Manila prior to December 7, 1941, the manuscripts arrived in New York on Pearl Harbor day.

Choosing to remain in burning Manila while *Time*'s correspondent in the Philippines, Melville Jacoby, followed the American retreat toward Bataan and Corregidor, Carl and Shelley Mydans shortly afterward, on January 2, 1942, were interned with about thirty-five hundred American and Allied nationals at Santo Tomás University in the Philippine capital. Describing the internment, the Mydans say: "At dusk on January 2, 1942, the Japanese advance forces entered the city. . . .With a minimum of contact and good order, they separated us from the Filipinos interned with us, confiscated our property and business, then moved on toward Bataan, leaving Manila a breadless, inert city."

In September 1942 the Mydans were fortunate enough to be transferred by the Japanese from Manila to the Chapei Civil Assembly Center in Shanghai, where they had more liberty. In December 1943, they were repatriated on the *Gripsholm*. In a letter to *Life*'s executive editor, Wilson Hicks, written soon after they boarded the Gripsholm, Shelley Mydans said: "Despite our anticipation, none of us was quite prepared for the emotions that suddenly choked us as we stepped onto the deck." Freedom to the fifteen hundred men, women, and children after twenty-two months of imprisonment felt like a new experience. Describing the Japanese repatriates, Shelley Mydans commented on the fact that they looked healthy and well-dressed in comparison to the pitifully thin and raggedly clothed Allied repatriates. She described their first meal aboard the *Gripsholm*—jokes and casual conversation did not very well camouflage the longing looks in the people's eyes as each dish was set before them. They had two years' hunger to appease, but had been advised to eat sparingly. In the words of Mrs. Mydans, "Our shrunken stomachs are easily satisfied, as are our hearts. They were both filled to discomfort—a little bit of food and the feeling that we were welcome." Greeted by the press upon their arrival in New York, Mydans said, "This is the first time I have ever been on the receiving end of this kind of business."

Mydans' first important undertaking after his return to the United States was a photo-report on the Tule Lake Segregation Camp—a relocation center for Japanese considered disloyal to the United States. His pictorial report of the camp contained illuminating photographs of a community run on a cooperative basis. After a week's stay at the center, *Life*'s correspondent noted that "the Japanese at Tule Lake have everything they need for happiness except the one thing they want most—liberty."

Mrs. Mydans was kept busy, too. After answering with her husband the large number of letters from relatives and friends of the internees at the Manila camp, she wrote two articles for the April 1944 issue of *Fortune*, "When the Jap Came to Manila" and "Asia for the Japanese." In the first article she pointed out the difficulties the Japanese encountered in the Philippines after December 1941 in trying to eradicate the islanders' concepts of personal freedom and their deep-seated Occidentalism. In "Asia for the Japanese," she wrote a study of Japan's growth during the Second World War from a "have not" nation to one of the great "have" nations of the world.

In February 1945, after the liberation of Manila, Shelley Smith Mydans' book *The Open City* was published. Written as a novel, *The Open City* portrays, through fictional characters, life as experienced by the internees at the Santo Tomás camp. She tells of the camp's organization into committees—education, purchasing, sanitation, disciplinary, recreation, work assignment, and insect control—a division of work which produced an efficiently run community bent on maintaining order and justice. Its reputation for being "the best camp in Asia" was attributed to the fact that the internees handled most of their own affairs. The author asserts that anxiety more than physical privations were responsible for the distress of many of the prisoners. (Mydans worked in the camp clinic and his wife was on the sanitation committee, cereal cleaning detail, and was monitor of the women's room.) The book also discusses such details as "the rumors from Bataan; the clogged drains; the weevily rice; the brutalities of the gendarmes, only worsened by complaint; and the heroisms and hesitations of Americans." Said Lewis Gannett '41, "Her book is a novel, and perhaps because it is a novel it is more desperately real than any factual account of life in such a camp could dare to be." James Fuller, reviewing the book in the New York *Times*, found *The Open City* an ingenuous novel written . . . with sympathy and sincerity. . . .Mrs. Mydans, for all her keen observations, is not a natural story-teller. . . . A factual journal by Mrs. Mydans would almost certainly have been impressive."

The next few months after their return from Manila found Mrs. Mydans at *Life*'s New York news office, and her husband in Italy as an accredited correspondent with the United States

MYDANS, CARL M. and MYDANS, SHELLEY SMITH—*Continued*

Army in the Mediterranean theater of war. He accompanied the Fifth Army in the Cassino fighting, and later covered the invasion of southern France and the drive north.

Then, as one of three correspondents on board General MacArthur's '41 ship, Mydans returned to the Philippines in October 1944 with the invasion forces. His wife joined him there about a month later. Assigned to the Second Squadron of the Eighth Cavalry Regiment of the First Cavalry Division, Mydans accompanied a motorized column in a sixty-mile dash through Japanese-held territory to free the internees of Santo Tomás. By February 4, 1945, the camp was in American hands. Mydans, describing the raising of the American flag over the camp, said, "The internees stood by breathlessly. . . .Some started singing 'God Bless America,' and the entire camp picked it up. I have never heard people singing 'God Bless America' and weeping openly. And these people have never seen soldiers—hard-bitten youngsters such as make up the First Cavalry—stand unashamed and weep." Carl Mydans was officially commended by Major General Verne A. D. Mudge, commanding general of the First Cavalry Division, for coverage of the "flying wedge" attack on Manila. Husband and wife are back in the United States again. Shelley Mydans will become a radio commentator for *Time* Magazine, beginning January 1946. She will do newscasting on a program called *Time for Women.* Carl Mydans is based in the New York home office of *Life* as a photographer.

Shelley Mydans, slim and pretty, is said to possess much patience in tracking down facts. Carl Mydans is short and dark, and has an amiable disposition, plus an adeptness for getting out of difficult situations. In 1939 he won the *United States Camera* Magazine's award.

NATHAN, GEORGE JEAN Feb. 14, 1882- Critic, author, editor

Address: The Royalton, 44 W. 44th St., New York City

Although there is a popular legend to the effect that George Jean Nathan, the drama critic, is a thoroughgoing skeptic who writes with "bitter scorn and contemptuous cynicism," it is generally conceded that no other American critic has so greatly influenced public taste or played a more important part in raising the standards of the American theater during a third of a century. A master at lampooning, Nathan has penned "annihilating waggeries" that have laid low many objects of his barbs. On the other hand he has stanchly and consistently supported those who have contributed originality, honesty, and dignity to the theater. He is credited with the introduction into the American theater of the best of the European modern dramatists, with the encouragement of young native playwrights like Eugene O'Neill and William Saroyan '40, and with a reformation of the general critical attitude toward the theater. In the past Nathan has been associated with a great many leading American and European periodicals. In 1945 he was conducting the drama departments for the *American Mercury* and *Esquire* as well as doing a weekly (Monday) drama report for the New York *Journal-American.* He is the author of thirty or more books, most of which are devoted to the theater. He was co-editor with H. L. Mencken of the *Smart Set* magazine (1914-23), and in 1924 helped Mencken found and edit the *American Mercury.*

George Jean Nathan was born in Fort Wayne, Indiana, on February 14, 1882, to Charles Naret and Ella (Nirdlinger) Nathan. His father, born Charles Naret, the son of Jean-Jacques and Renée (Callot) Naret, was given his stepfather's name (Nathan) when his mother remarried. Charles Naret Nathan, a Parisian lawyer, was a graduate of Heidelberg. A linguist, a skilled fencer, and the owner of French vineyards and a Brazilian coffee plantation, he had lived in almost every civilized country of the globe. On a visit to Fort Wayne, Indiana, he met and was married to Ella Nirdlinger, whose family had settled there when it was little more than a frontier fort. Of German origin, the Nirdlingers made the journey to Fort Wayne from Chambersburg, Pennsylvania, in a covered wagon. Although Nathan's father never engaged in business in Indiana the family continued to live there until George Jean was four years old, when they moved to Cleveland.

In Cleveland George attended the public school and received private instruction in Spanish, German, and French, as well as piano lessons. As early as eleven the future critic showed interest in the theater; he wrote dramas which were acted by the neighborhood children in the Nathan barn. "Love: A Scientific Analysis," his first long piece, was written at the age of sixteen. The flippancy with which he dealt with "poor Cupid on the dissecting table," foreshadowed the writing of Nathan, the man: it was the "protoplasmic ancestor" of his books *The Bachelor Life* (1941) and *Beware of Parents* (1943), inspired, he says, by his own unmarried state at the age of sixty.

Graduated from the Cleveland High School, young Nathan chose to go to Cornell because it seemed to him the one of all American universities to approach most closely the European universities which he had come to know during three summers spent abroad in his high-school days. His record as an undergraduate shows that he was active in extracurricular activities. He was a member of Kappa Sigma; Quill and Dagger, senior honorary society; the Masque, the dramatic club; and the fencing team. He was also editor of the college daily, the *Sun*, and of the *Cornell Widow.* In addition to fencing (for which he won the Amsler Gold Medal) he was excellent at tennis. Upon obtaining his B.A. degree from Cornell (1904), Nathan went to Italy where he attended the University of Bologna for a year. He returned to the States and, through the influence of his uncle, Charles Frederic Nirdlinger, playwright and well known critic of his day and a friend of James

Gordon Bennett, editor of the New York *Herald*, young Nathan became a cub reporter at fifteen dollars a week on the *Herald* (1905-06). The writing of murder stories, sports, and Sunday feature stories followed in the succession named. In between his feature stories Nathan, as third-string drama critic, occasionally turned in a play review. Irked by the many "don'ts" of Bennett's editorial policy, Nathan left the newspaper to become associate editor and drama critic on two magazines, the *Outing* and the *Bohemian* (1906-08). Nathan's biographer, Isaac Goldberg, in *Theatre of George Jean Nathan* (1926), says that Nathan has too much imagination and "caprice in the face of facts" to have been happy as a newspaperman. (Nathan has consistently refused to accept the post of drama critic on any daily newspaper because, he says, he could not conscientiously turn in a play review immediately after seeing a performance; to him it seems that critical opinions should be given after longer consideration.)

One of the best pieces of advice Nathan ever received on free-lance writing came from Finley Peter Dunne, creator of the popular cartoon character, Mr. Dooley. "Don't ever bother about the dignity or importance of the medium for which you write," said Dunne. "It doesn't matter where your stuff appears, so long as it is good. If it is good, the right people are sure to see it." In his career Nathan has been associated with more than thirty publications as drama reviewer. By 1925 he had become the most widely read and the highest paid dramatic critic in the world. At that time, besides holding a staff position on *Judge*, he contributed a weekly drama review to the New York *Telegraph* which was widely sold throughout the United States and in other countries by the Wheeler Syndicate. During the same year he also contributed articles on the theater to English, German, Italian, and Dutch journals. Although the victims of his diatribes attempted reprisals, no one disputed his thorough knowledge of the world theater and its literature, his catholicity of taste, and his independence of judgment. His fight to raise the American theater from its low estate of over two decades ago to its present artistic heights as seen in the productions of the Theatre Guild, Arthur Hopkins, Guthrie McClintic '43, Brock Pemberton '45 (to name only a few), was carried on alone through what has been called the most searching and illuminating sort of criticism—burlesque. "This method," wrote Mencken in a defense of Nathan, "of course, makes for broken heads. . . . There is so far as I know no one on Broadway who has not tried, at one time or another, to dispose of Nathan *attentat*." Nathan's criticism, Mencken pointed out, is founded on the Benedetto Croce '44 doctrine, "that every work of art is at bottom unique, and that it is the business of the critic, not to label and pigeon-hole it, but to seek for its inner intent and content and to value it according as that intent is carried out and the content is valid and worthwhile. . . .It lets in every theatrical work that has an honest aim and achieves that aim passably and is presented frankly for what it is. Bear this theory in mind," Mencken continued, "and you have a clear explanation of his [Nathan's] lampooning and his ardent championing of such widely diverse men."

GEORGE JEAN NATHAN

In the second decade of the century Nathan championed Max Reinhardt's *The Miracle*, the early plays of George Bernard Shaw '44, "the daring nobodies of the Grand Guignol, such divergent originals as Lord Dunsany, Ziegfeld, George M. Cohan, and Arthur Schnitzler; the farces of Avery Hopwood, the whimsey humor of Clare Kummer and Ferenc Molnar, the simple and unaffected writing of Eleanor Gates in *The Poor Little Rich Girl*." Mencken continues, "He distinguished what was sound in the Little Theater movement from what was mere attitudinizing and pseudo-intellectuality. He refused to recognize Belasco as a profound artist or Augustus Thomas as a great playwright or Maeterlinck as a great thinker. Coming upon the scene at the height of the Ibsen mania, he ranged himself against its windy pretenses from the beginning. He saw the high merit of Ibsen as a dramatic craftsman but he also saw how platitudinous was the ideational content of his plays and announced the facts in terms highly offensive to the Ibsenites." To the less discerning, Nathan's destructive methods are most frequently remembered, although he has supported many a "lost" play. He very early recognized O'Neill as a playwright of "size," a term Nathan reserves for genius. Although O'Neill had had his first plays produced by the Provincetown Players, he has said that Nathan's publication in *Smart Set* of three of his one-act plays, the *Long Voyage Home, Ile,* and *Moon of the Caribbees*, presented him to a wider and more general public, and that recognition from Nathan meant a disinterested and critical approval. (Nathan was also instrumental in the production of O'Neill's first long play, *Beyond the Horizon.*) Later Nathan was to welcome the Abbey Players to the American stage, and to see the special qualities in the playwrights, Sean O'Casey, Paul Vincent Carroll, and William Saroyan.

Edith R. Isaacs of the *Theatre Arts* Magazine said that when Nathan sees quality in an artist, he becomes at once not only his champion

NATHAN, GEORGE JEAN—*Continued*

but his salesman to the public. "He trumpets alone, and long, if need be." Eleanora Duse was one of the few actresses whom the critic respected enough not to want to touch with a satirical pen. Although John Barrymore's *Hamlet* had received the highest acclaim from the critics, Nathan declared that his performance was so critically precise "that it is at times histrionically defective."

According to Isaac Goldberg the close friendship between Nathan and Mencken began when they were engaged to edit *Smart Set* in 1914. Over their first cocktail, following a conference, they discovered that they had many opinions and attitudes in common. "That night," recalls Nathan, "we met again over the beer table." The friendship thus begun had a profound effect on American culture. Under their editorship *Smart Set* "projected new attitudes, campaigned for a free, virile, open-air joy in the arts." While some of its humor was regarded as verging on vulgarity, it was "Rabelais rather than barbershop." The co-editors contributed, in addition to book reviews (by Mencken) and drama reviews (by Nathan), a department (written jointly) called *Répétition Générale*, which contained ideational patter and their observations on the human comedy. The magazine thrived, becoming "a focus of intellectual rebelliousness, a rally-ground for disaffected youth, a forum for the new talents." Some of the new talents discovered or fostered under the Mencken-Nathan guidance of *Smart Set* were F. Scott Fitzgerald, Theodore Dreiser, James Branch Cabell, Aldous Huxley, Ben Hecht ['42], and James Joyce. However, despite its pleasing of the intelligentsia, *Smart Set* was not a financial success, earning for each of the erudite pair, who were given stock in the publication in lieu of salary, less than fifty dollars a week. When Alfred Knopf ['43], the publisher, offered to back them in a new venture, they accepted, resigning from *Smart Set*.

The new venture was the *American Mercury*, which Nathan and Mencken founded in 1924. In this they owned an equal share of the stock. They also shared in the job of editing, Mencken writing the book reviews and a monthly editorial, and Nathan being responsible for the drama department and, to a larger degree than Mencken, for *Clinical Notes*, the successor to *Smart Set*'s *Répétition Générale*. In a 1925 *Bookman* article Nathan wrote: "A magazine, to me—and to my associate, friend, and partner Mencken no less— is a toy, something with which to amuse ourselves and also, perhaps, a sufficient number of similarly minded readers to keep the mechanism of the toy from running down. It provides us with the pleasure ot unloading certain of our ideas upon the world, and sensing the reaction of other men to those ideas." A professed hedonist, Nathan has repeatedly stated that he had "no itch to make the world a better place to live in," and that he had never indulged in either "messiah" editing or writing. When the *Mercury* under the more socially conscious Mencken veered toward politics and considerations of a nonaesthetic nature, Nathan announced his resignation as co-editor (August 1925) and his continuance as a contributing editor. This change, however, did not affect the friendship of the two men. After the *Mercury* went into other hands (it had been a financial and literary success from the beginning) Nathan with Theodore Dreiser, Eugene O'Neill, James Branch Cabell, and Ernest Boyd founded the American *Spectator* (1932-37), a "literary newspaper," patterned after the London *Spectator*.

In 1913 Nathan interrupted his duties as a critic to write *The Eternal Mystery*, a one-act play, which was presented on Holbrook Blinn's distinguished program of short plays at New York's Princess Theatre. Dealing with "an illusory agnostic element in religion" (Nathan is an avowed agnostic) the playlet was called sacrilegious, and when it met with the same criticism on its production by tributary theaters in Philadelphia, Pittsburgh, and Detroit, Nathan withdrew it from American production. With the exception of three scenarios for plays which he and Mencken had planned to write but did not finish, this was Nathan's only attempt at serious creative writing for the theater. The play *Heliogabalus* (1920), written in collaboration with Mencken, was never intended for production. Published in a private and limited edition it was pronounced by James Gibbons Huneker, the art and music critic, "a brilliant farce. . .a hell-broth of wit, humor, fantasy, and downright idol-smashing," with a Roman rather than a Christian moral. Nathan's third play, also a product of his impishness, was published under the title *The Avon Flows* (1937). In it he "orchestrated" three of Shakespeare's plays into a "comedy of modern marriage." The opening act is taken from *Romeo and Juliet*, the second and third acts are transposed scenes (dialogue intact) from *Othello* and *The Taming of the Shrew*. The re-identification of the leading characters from the last named plays with the characters Romeo and Juliet and added stage directions resulted in an amusing play.

The critic's series of books on the contemporary theater, published annually since 1916, have met with diverse reviews. *The Popular Theatre* (1918), the first to receive wide acclaim, won from Gordon Craig the tribute that Nathan was greater than Shaw in the art of criticism: "He sees . . . Shaw tries to see. He feels . . . Shaw thinks." *Comedians All* (1919) drew so many adverse reviews that Alexander Woollcott ['41], then drama critic of the New York *Times*, came to his colleague's defense: "Many popular misconceptions and dislikes begotten by the Nathan mannerisms should not betray his not inconsiderable public from profiting by the soundness of much that he writes." Nathan's prolific output of books on the theater is seen as taxing his ingenuity at titling. *Encyclopædia of the Theatre*, the title given his 1940 volume, was called a misnomer, inasmuch as it is not an encyclopedia except in the alphabetical arrangement of subjects. The *New Yorker* pronounced it "good standard Nathan"; the New York *Times* reviewer pointed out what he considered Nathan shortcomings as repetitiousness, lack of clarity and "a style too breezy." In 1943 when he used the title *Theatre Book of the Year 1942-1943* and announced a projected series of yearbooks under that title, there was a general protest from reviewers. "A misleading title," said Burton Rascoe of the New York *World-Telegram*. "It is in no sense a completely rounded survey," or a "book of record." The *Library Journal* warned that "in no way is it a rival of Burns Mantle's '44 justly famous annual volume." The subtitle, *A Record and an Interpretation*, was considered more appropriate. These yearbooks contain an honor list of "bests" in different fields of theatrical accomplishment, critical essays on the season's plays, some statistics, and an index. The New York *Times* review of Nathan's second yearbook (1943-1944) proclaimed him to be "still the nimblest spirit in the narrow row of world dramatic criticism." In his third yearbook (1944-1945) Nathan remained as "jubilantly dizzy" as ever, although for the first time he arranged his impressions chronologically and even provided an index. John Mason Brown wrote of Nathan in the *Saturday Review of Literature*: "The energy of the man is unfailing and incredible . . . his critical headwork at sixty-three amazing . . . his joy in his job undiminished, his precision unerring."

Possibly the two most important books Nathan has written on subjects other than the theater are *The American Credo* (1920), written in collaboration with Mencken, and *The New American Credo* (1927), which he wrote alone. The first-named, a book of 193 pages, contains a preface of 103 pages. This disproportion was justified by the authors by, "Having read it [the preface], one need not read the book." In their book the authors held that "deep down in every man there is a body of congenital attitudes, a corpus of ineradicable doctrines and ways of thinking, that determines the reactions to this ideational environment." The book's preface consists of ratiocinations on those attitudes and doctrine, the book itself is a collection of maxims and traditional tenets of the modern man. The Boston *Transcript*'s critic wrote of the book: "The truth about America and its inhabitants is told as it has not been for some time." Disagreeing, the *Survey* commented: "The stringing together of widely held fallacies does not constitute an American credo." *The New American Credo* was pronounced a "more significant book" than the first *Credo* but "still far from a complete corpus of the current superstitions, prejudices and platitudes which help to render literature and conversation deadly."

The Borzoi Reader (1936), selections from Knopf publications, contains Nathan's "Three Friends: Lewis, O'Neill, and Dreiser." These intimate recollections of the three famous men reveal the author's keen insight into character and his ability to do "exquisite" word caricatures. They also reveal Nathan and Mencken in the lighter moments of their *Smart Set* days. Dreiser, painted as a somber individual, was the butt of their practical jokes, such as filling his mail-box with Black Hand threats, sending him letters purportedly from the President urging him to visit the White House, a photograph of the Czar bearing the inscription: "To Theodore Dreiser, gentleman and scholar—well, anyway, scholar." In 1945 Nathan edited a collection of seven *Pulitzer Prize Plays*.

Nathan's facial characteristics are eyes "like the middle of August," a sensitive mouth, a "nice" nose; his hair, originally dark, is gray. Five feet and seven and one-half inches tall, he weighs 130 pounds. Nathan's favorite form of exercise is now "walking to the nearest taxicab," his favorite recreation, "sitting and smoking." His voice is pleasing. He has a "seductive" collection of walking sticks, and of his many overcoats, one (of Russian wolf) Broadway says he has trained to bark. On special first nights he wears a silk hat and Inverness cape. He has lived in a three-room apartment in The Royalton for thirty years. Through the years of his bachelorhood the rooms have become filled with books and manuscripts. They line the walls, are stacked ceiling-high on chairs, tables, and on the floor. His favorite restaurants are the 21 Club, the Colony, and Fourteenth-Street Luchow's. Elsa Maxwell '43 says that he is one of a "strange, ill-assorted, but charming group of people who dine with Dumpa" (the Fifth Avenue and Newport Mrs. Hermann Oelrichs) every Christmas. "Nathan under a Christmas tree," says the columnist, "giving and receiving presents . . . his eyes swimming with sentimental and true affection for his friends," is not the man his public confessions would lead you to expect.

NEAGLE, ANNA (nēg′l) Oct. 20, 1904-
Motion picture actress

WILCOX, HERBERT Sept. 19, 1892-
Motion picture producer and director

Address: b. Pathé Films, Film House, Wardour St., London; h. Hartfield House, Deacons Hill, Elstree, Hertfordshire, England

"The culmination of the longest professional association in the British film industry," is the way the Irish-born British producer and director, Herbert Wilcox, described his marriage to the English film star, Anna Neagle, which took place at a London registry office in 1943. Since 1932 in their respective capacities they have made nineteen pictures together, including the memorable *Nell Gwynn* (1934), *Victoria the Great* (1937), and the 1945 release *A Yank in London.* In addition to discovering Miss Neagle, who, under his direction, rose from an unstarred role in musical comedy to "England's first lady of the screen," Wilcox is credited with introducing to the screen Charles Laughton, Herbert Mar-

Swarbrick studios, London

ANNA NEAGLE

shall, Sir C. Aubrey Smith '44, John Loder, Jack Buchanan, and Dame Sybil Thorndike. He is one of the few British producers who have made films in Hollywood and whose English-made pictures have been widely distributed in the United States.

Anna Neagle was born Marjorie Robertson in Forest Gate, near London, on October 20, 1904 (*Who's Who in the Theatre*). She is the daughter of Herbert William Robertson, then a captain in the British Merchant Marine, and of Florence (Neagle) Robertson, whose surname the actress later took for the stage. "Of all the good fortune I've had," Miss Neagle once told an interviewer, "the greatest was a happy home life during my childhood." With her two elder brothers she played cricket, and when on occasional cruises with her father swabbed down decks and cooked in the ship's galley. Pretty, blond Marjorie was a "natural" for heroine roles in school plays, but a shyness which she did not overcome for many years made her refuse everything except ensemble work. At ten she began taking dancing lessons and at sixteen entered a school for advanced dancing. A *Collier's* article reports that while at dancing school the future star became a dance instructor or a dance hostess at a West End London hotel. But, being stepped upon by portly gentlemen did not please her, and she soon left. It is also recorded that she had been a gymnasium teacher as well as dancing teacher, and that in the days before entering the theater world she reached the finals in a world championship dance contest held in Queen's Hall. Later, when forced to add to the family income because of her father's illness, Miss Neagle became a chorus girl.

"Dangerously contented" is the expression the star has used to describe her attitude during the six years she spent in the choruses of different London musicals. Her first engagement was in the 1925 edition of André Charlot's famous revues, the revues that introduced Beatrice Lillie '45, Gertrude Lawrence '40, and other stars to London audiences. Other musicals of Miss Neagle's chorus days were the London presentations of American productions, *Rose Marie* (1926) and *Desert Song* (1927), and Noel Coward's '41 *This Year of Grace* (1928). It was while she was working in the cabaret at the Trocadero Restaurant that she entered the cast of *Wake Up and Dream* (1929), a revue with Cole Porter '40 music and lyrics. The success of this London production, in which Jack Buchanan, Jessie Matthews, and Tillie Losch '44 were starred, brought it and Miss Neagle to New York for 136 performances on Broadway.

It was the American chorus girls who jolted the English chorine out of her dangerous contentment. Under that stimulus, Miss Neagle set out to promote herself. She began visiting Hollywood agents, took tap dancing and singing lessons. Nevertheless, although the agents told her she was lovely to look at, she failed to secure a contract. Her luck was not much better when she returned to London. For four months she tramped from office to office, securing only bit parts in two motion pictures, *Should a Doctor Tell?* and *The Chinese Bungalow,* the latter described as "an early English movie which even the British are trying to forget."

Then one day she received a tryout notification for Buchanan's first show as a producer, *Stand Up and Sing*. A place in the chorus with the star of the show that had taken her to New York was hers for the asking, but she requested the feminine lead. And, surprisingly enough, she received it, for Buchanan had felt that his own drawing power was sufficient to carry the show and that an unknown lead would save him many pounds in salary. During the out-of-town tryout the new leading lady suffered from the shyness which had made her content with chorus work for six years. But Buchanan was kind—he "built her up in her own estimation, and London [in 1931] was a cinch." Moreover, she proved a "great success," and the musical ran for more than three hundred performances.

While the show was still running Buchanan took Miss Neagle to meet producer Herbert Wilcox. Actually, it was not their first introduction. Earlier, the actress had tried to get a part in a Wilcox film starring Madeleine Carroll, but at that time Miss Neagle's future husband, the man with whom she was to become internationally famous, gave her a perfunctory dismissal. On this second occasion their long association began when Wilcox decided to use the young actress in a picture he was directing.

Herbert Wilcox had been producing pictures for more than ten years before he met Miss Neagle. A dozen years her senior, he was born in Cork, Ireland, on April 19, in the year 1891 (*International Motion Picture Almanac*). His parents, Joseph John and Mary (Healy) Wilcox, moved to England while he was still a boy, and he was educated in the Brighton schools. He worked for a time on a newspaper, but when England entered the war he enlisted, and served as pilot in the RAF until 1919. Wilcox's connection with the motion picture field began, one source records, with his sale of a number of original stories to several film companies. In another account it is told that in 1919 he began producing pictures independently, having accumulated funds through working as a film renter in Leeds. His initial offering as a producer seems to have been *The Wonderful Story*, called a masterpiece of the early days of the silent film. Numerous other silent pictures followed: *Chu Chin Chow, Madame Pompadour, The Only Way, Paddy the Next Best Thing, The Triumph of the Scarlet Pimpernel,* the production in which Miss Neagle had tried to get a bit part. After the advent of the talkies, Wilcox organized the British and Dominion Productions, and his debut as a producer of talking pictures was made with *Black Waters,* which starred James Kirkwood and Mary Brian.

The first picture that Wilcox was to make with Miss Neagle in the cast was *Good Night, Vienna* (1931) (released in the United States in 1932 as *Magic Night*). The actress was now calling herself Anna Neagle, for Marjorie Robertson was too well known as a member of the chorus line. Her first important picture in the Wilcox studios was the adaptation of Noel Coward's *Bitter Sweet* (1933), but her first big hit was in Wilcox's remake of *Nell Gwynn* (1934), which the producer had made originally with Dorothy Gish '44 in the title role. English reviewers called the new star "vivacious", "alluring," and "an admirable actress." Although there were dissenting voices on Wilcox's direction of the famous love story of Charles II (played by Sir Cedric Hardwicke) and Nell, orange-seller and actress, the film was popular with the English public. Before it could be released in the United States, the Hays '43 Office demanded drastic changes in the script. *Time* Magazine commented that these changes had "made it one of the more genteel specimens of British historical cinema," but that its lack of *esprit,* and the frequently forlorn comedy scenes were compensated for by the sympathetic acting of Hardwicke and Neagle.

Other motion pictures by the Neagle-Wilcox team followed, for a time a series of historical films. One of the greatest successes was *Victoria the Great,* which opened in London in September 1937. Before the première the film had won the "Cup of all Nations" award at an international contest held in Vienna, and Wilcox, who has been called the P. T. Barnum of the cinema, allowed this news to "slip out." Piccadilly on opening night was "jammed with swells in toppers and ladies in sables": British society for the first time was honoring the lowly flickers. After expressing regret over the omission of many historically important issues in the sixty-year reign of Victoria, the *Spectator* concluded that, "if the limits are too narrow, the excellence of the portrayals . . . the authenticity of the settings, and the beauty of the photography make up for much." The London *Mercury and Bookman* said, "Judged by the average standards of screen entertainment, *Victoria the Great* is an unusually good picture. Judged as a piece of craftsmanship, it is not brilliant but very skillful." American critics hailed it as the best film yet to come out of England. It was considered so satisfactory a story of Great Britain's queen, played with noteworthy distinction by Miss Neagle, that Hollywood did not film Laurence Housman's *Victoria Regina,* in which Helen Hayes '42 had captivated American audiences a season before.

HERBERT WILCOX

Victoria was the actress and producer's first big financial success. In fact, so low had the Wilcox coffers been previously that Miss Neagle, it is said, was forced to add her personal savings to tide him through production. When RKO rewarded them with a contract for several pictures to be released through the Hollywood company, Miss Neagle remarked that it was a great relief to know that in the future they would be able to do a picture "without the cashier and the sheriff playing tag among the sets."

Shortly before the release of *Victoria,* the Imperator Film Productions, Ltd., was organized, and Wilcox became chairman and managing director. A unit of this syndicate was Wilcox Productions. One of the earlier pictures to be made under this new setup was *Sixty Glorious Years* (1938), which Miss Neagle and Wilcox made as a sequel to *Victoria the Great.* "Anybody who possesses even a small acquaintance with the history and the personalities of the nineteenth century," wrote the reviewer of the *New Statesman and Nation,* "must recognize that the thing is a travesty of the truth." Nevertheless, the film received "a shower of praise," "even in the most respectable press," in the words of the *New Statesman* critic.

In 1939 another biographical picture was released by Wilcox, *Nurse Edith Cavell.* The story of the English nurse who was executed by a German firing squad for espionage during the First World War, had been produced in 1920 under the title *Dawn,* with Dame Sybil Thorndike as Nurse Cavell. *Sociology and Social Research* hailed Miss Neagle in the role as England's finest actress, the story "a reminder to the civilized world that the military code at its worst reads, 'No mercy to be shown.'" The *Spectator* found Wilcox's new version of the story "all exactly as you would expect: Belgians sing Anglican carols . . . .

NEAGLE, ANNA, and WILCOX, HERBERT—*Continued*

Germans . . . . all brutes in boots (except for the one regulation officer who is always inserted in such films to show the measure of our impartiality)." Miss Neagle looked nice as the nurse, continued the review, but "she moves rigidly on the set, as if wheels were concealed under the stately skirt: she says her piece with flat dignity and trolleys out again." The blame for this lack of "life, character, and truth" was placed on the "slow and ponderous" production.

On the Hollywood RKO lot the English pair in 1940 decided to shelve *Queen of Destiny,* a third play about Victoria, in favor of a musical comedy. *Irene,* a 1919 American hit, was selected. American critics were warm in their praise of the actress' beauty and "her smart dancing legs," but found the Wilcox adaptation "stiffly British." Vincent Youmans' '44 *No, No, Nanette,* which Wilcox put before the camera in 1940 fared no better with the American press. *Sunny,* based on an old Otto Harbach and Oscar Hammerstein 2d '44 musical, had, in the opinion of the New York *Sun,* "the snap" that was missing in the previous musicals. "After two years [1940-41] in Hollywood," it was commented, "Wilcox has picked up a brisker technique."

"Wilcox has fashioned an honest and timely biography," wrote *Time* of *Wings and the Woman* (1942) in which Miss Neagle played Amy Johnson Mollison, the world-renown English aviator who lost her life in 1941 when the plane she was ferrying for the Air Transport Auxiliary broke up over the Thames estuary. Wilcox this time had given the story a slow pace and a minimum of fictional embroidery. *Newsweek* called Miss Neagle's performance "a restrained, sympathetic, and always creditable characterization of the flier." The next year Miss Neagle and Wilcox both worked on *Forever and a Day* (1943), a screen play made in Hollywood by seven well known producers and directors, some twenty writers, and an all-star English-born cast. The picture was conceived in 1941 as a tribute to English courage in the war, and was made cooperatively by both Britons and Americans, who gave their services free of charge. Profits went to charitable organizations.

The first picture that Miss Neagle and Wilcox made upon their return to England after America's entry into the war was *The Yellow Canary* (England, 1942; United States, 1944). A spy story of the Second World War, it revealed to critics that Wilcox had not forgotten his Hollywood lessons in faster tempo. And Miss Neagle, one reviewer declared, "gives a good account of herself as a British lady of quality who isn't as bad as duty (in her role of a counterspy) forces her to be." When the producer-director visited the United States again, in July 1945, he signed a contract with Twentieth Century-Fox for a series of pictures scheduled for world-wide distribution. The first of these is expected to be *A Yank in London,* originally entitled *I Lived in Grosvenor Square.* "It is the best bet on Anglo-American relations build-up the screen has yet offered," was *Variety*'s preview comment on the film, which is based on an actual story of a heroic American Air Corps crew in England. Miss Neagle, another reviewer wrote, gives her "most convincing performance to date."

Since becoming a film actress Miss Neagle has occasionally returned to the stage. In 1934 the former chorus girl played Rosalind in *As You Like It* and Olivia in *Twelfth Night.* A few years later, while *Victoria the Great* was drawing record crowds to a Piccadilly film house, the actress was appearing in person in another Piccadilly theater in the title role of Barrie's *Peter Pan.* In 1945, besides touring Army camps on the Continent in *French Without Tears,* Miss Neagle played London and the provinces in Jane Austen's *Emma.*

The star is five feet five inches tall and weighs one hundred and eighteen pounds. To these statistics one male reporter has added that she has red-gold hair, deep blue eyes, "teeth that reduce tooth paste models to shuddering defeats," and a smile that could "make a Romeo out of a woman-hater." In addition, in 1940 the Fashion Academy of New York voted her the best-dressed woman on the international screen. For exercise, the actress walks and bicycles to offset the effects of the lemon pie she likes so well. She has been described as modest and sensible, and when a guest on *Information, Please* one evening in 1941 she acquitted herself with "such charm and wit" that she was invited to participate in the movie short made of the radio program. Part of the acquitting consisted of spotting a Chopin waltz before music expert Oscar Levant '40 did, and correcting the Shakespearean authorities on a quotation from *King Lear.*

In a July 1945 interview with the New York *Herald Tribune,* Miss Neagle's husband said, in comparing the film products of the United States and England, that he believes that the chief difference is the matter of pace. In his opinion (contrary to critical opinion on some of his films), "English films have a faster, more provocative pace . . . mostly because Hollywood chooses to slow down its films by abusing the use of the close-up." The producer-director rarely makes a change in his shooting script, rarely shoots more than thirteen takes of any action, never acts out a scene for his carefully chosen cast, and is one director who never raises his voice.

Wilcox, who wears glasses, is described as blondish, inclined to be stocky, and not much taller than Miss Neagle. A superstition of the Irish-born producer is centered on the number thirteen. Since his World War days in the RAF, when several incidents involving the number made him regard it as a lucky one, his life has been quite wittingly interspersed with thirteens—today all his important business undertakings are begun on that day of the month. When traveling, he is usually accompanied by his manservant, Taylor, who is distinguished by his birthplace, Windsor Castle, and by his mixing of Wilcox's favorite drink, the English version of a mint julep (gin substituted for whisky). Wilcox frequently talks in superlatives, particularly when speaking of his favorite star, Mrs. Wilcox. Shortly after his marriage to the actress in August 1943, the British Broadcasting Company dramatized the romance, with the principals playing themselves. The Wilcoxes have a country home near London, and from there, until gasoline rationing, traveled to every soccer game within reasonable motoring distance. Taylor's opinion is that the couple are "real people."

NEGRIN, JUAN (nā-grēn' hwän) 1892(?)- Spanish Republican leader; scientist

With the growing international opposition to the Franco '42 dictatorship in Spain, Juan Negrín, the last Premier of the Republic, has become a cohesive force among Spanish Republicans within the country and in exile in England, France, the United States, and Mexico. The Socialist Negrín has been working throughout his own exile toward the re-establishment of a democratic Spain and, in the opinion of Freda Kirchwey '42, he "will succeed in drawing together all groups except the die-hard irreconcilables."

Juan Negrín was born in the Canary Islands, the Spanish possession in the Atlantic Ocean off the coast of Africa; one source gives the date as 1892. Educated largely on the Continent, he studied medicine at several German universities. It was in these student years that he came into contact with the leaders of German socialism and his political ideology developed. When he had completed his studies in Germany, Negrín studied in other European capitals. Returning finally to Madrid, he became one of the youngest professors in Spain. (Negrín was one of the founders of University City, which was later reduced to rubble in the fight for the capital.) He served as professor of physiology at the Medical Faculty of Madrid University, and was also at different times director of the Physiological Institute and director of the Madrid Chemical Laboratory. In addition to his scientific prominence, the Spanish intellectual gained a reputation as an expert in economic and financial affairs and as a political philosopher. The professor's practical ability was also demonstrated, as for example, in his formation of *Editorial España*, described as "that great nursery of Spanish contemporary thought." A member of the Socialist Party for many years, he actively entered politics in September 1936 when he became Minister of Finance in the Largo Caballero Cabinet. One of his first acts upon assuming office was to reassure American investors concerning their holdings in Spain.

In April 1931 the people of Spain had voted for a republic and King Alfonso had fled into exile. Thus by a bloodless revolution the Bourbon monarchy was replaced by moderate Republican leaders, with a new constitution which provided for universal suffrage, sweeping social legislation, the separation of Church and State, and cooperation with the League of Nations. As Minister of Finance Negrín survived many Cabinet changes in the swiftly flowing current of Spanish politics. In May 1937 the professor-politician was made Premier, a fact which is said to have caused some surprise since he was considered a mediator rather than a leader. Jacques Ambrun, writing in *Living Age* (October 1938), pronounced Negrín's election "a good thing in many respects, and, indeed, [it] marks a new era in Spanish politics." He emphasized that Negrín, "the leading spirit of Republican Spain," was a man whose "patriotism is not marred by overexcessive, foaming-at-the-mouth nationalism and to whom Europe is a reality. . . .By education and conviction, he is primarily a European."

JUAN NEGRIN

Negrín retained the portfolio of Minister of Finance and Economy in his own Cabinet, and in April 1938 assumed the added responsibility of the Ministry of National Defense. Spain, in the grip of a bloody civil war since July 1936, was ravaged as the Loyalists fought for the Republic against German and Italian arms under Franco's command. For almost three years the struggle raged. William C. Atkinson, writing in the British *Fortnightly* in January 1939, stated that the Republican resistance "belied all the prophets, even the dictators; it will be remembered when the history of human values in the twentieth century comes to be written." To the claim of Franco sympathizers in the United States that he was fighting bolshevism, one reporter stated, "There was not a single Communist in the Popular Front Government when the Franco forces launched their rebellion," and *Time* Magazine pointed out that Negrín's Cabinet was "no more and no less Red than that of French Premier Léon Blum '40."

Negrín and the Republicans appealed to the world for help, but the non-interventionist policy of the democracies and increasing German and Italian aid to Franco doomed the Republic. At Geneva in 1938 in one of his many calls for action by the League of Nations, the Spanish Premier stated, "Once foreign intervention in Spain has been eliminated, I can assure you a policy of national conciliation, conducted under the firm, energetic direction of an authoritative government, will make it possible for

NEGRIN, JUAN—*Continued*

all Spaniards to forget these years of conflict and cruelty and will rapidly re-establish the domestic peace." Negrín also announced at that time the evacuation of foreign volunteers from the Republican ranks—those men who had come from many countries to fight in the international brigades beside the Loyalists. Treatment of Spain's case by the League was described by one reporter as "power politics in the raw and at their worst." In those stormy years Negrín once told reporters, "Gas masks today are worth more than all the protests to Geneva. We will fight in the language the enemy understands."

On May 1, 1938, Negrín announced a long-term program, addressed to all Spaniards on both sides asking them to cooperate in the building of a new, peaceful Spain. Among the Premier's "Thirteen Points" were: 1) the absolute independence and territorial integrity of the country; 2) the ejection of all foreign elements, military and economic, "who since July 1936 have invaded Spain and sought to dominate her economic life in their own interests"; 3) a republic of the people, based on the principles of pure democracy, with a strong executive power dependent at all times on the will of the people, plus provisions for social legislation, agrarian reform, and amnesty of prisoners. But Franco's troops continued their advance, and the closing phase of the struggle was marked by upheavals within the Loyalist regime itself. When President Manuel Azaña resigned in February 1939 Negrín became active head of state. A month later Madrid was delivered to the Nationalists by a military coup d'état, and the Government leaders fled to France. There Negrín remained until June 1940 when he went to live in England.

Living in exile in London, Negrín has maintained contact with his ministers, many of whom are in Mexico. (Meanwhile, in Madrid in 1941 a Franco court stripped him of his citizenship and imposed a fine of one hundred million pesetas.) The Spanish leader is said to have retained the optimistic confidence which distinguished him even in the hopeless days of the civil war as he now plans for the restoration of the Republic. In 1941, in his first speech after the end of the civil war, Negrín told a group of Loyalists in London of the continuing resistance within their country. He called for an end to "squandering precious energies in back-room recriminations and personal knife-play," and urged all to join in the common struggle against fascism and nazism. Early in 1942 the press carried reports of Negrín's fight on another front, the scientific—he assisted in experiments carried on by the eminent British scientist J. B. S. Haldane '40, among them, the testing of the effects of gases on submarine crews.

With the military defeat of fascism in Europe the anti-Franco forces have gained power, and predictions are made of impending trouble for the Falangist leader. In January 1945, writing in *PM,* Alexander H. Uhl declared, "The battle for Spain is going on right now." That same month a meeting in New York's Madison Square Garden under the sponsorship of Nation Associates and other liberal groups urged the United States to break relations with Franco Spain. The rally was scheduled to hear an address by Negrín broadcast from London, but British authorities refused the Spaniard permission to use the radiotelephone service, an action which caused adverse comment in Britain and America. Negrín's speech was, however, read at the meeting and was thereafter reprinted in various periodicals. The Spanish Premier, who had broken his five-year silence, self-imposed because he "did not want to add fuel to the political bickerings within the Spanish emigration," emphasized his belief that the Spanish people were ready and able to conduct their own affairs without intervention, but would welcome the help of friends.

In February Ted Allan in a *Collier's* article, "Battle For Spain," wrote that he found Spain industrially under German "occupation" and that more people died from starvation and disease in Spain from 1941 to 1944 than in any other country in Europe. Allan told of the underground movement directed by a broad anti-Franco group, the Junta Suprema de Unión Nacional, whose leaders still repeat their war slogan, "Madrid will yet be the tomb of fascism." Negrín, Allan stated, "may be the hope of Spain—for he alone may be able to unite all the various factions. Once before all the anti-Franco factions fought under his leadership during the civil war, and Spain's underground is hoping that he will again emerge to head a national coalition." In March Negrín spent five weeks in conference with Spanish leaders in France, winning the support of the Communists. A few months before that he had conferred with anti-Franco political groups in Paris, where the French press had welcomed him. In March Clifton Daniel reported in the New York *Times,* "Dr. Negrín's prestige has grown enormously in the past six months."

In May 1945 Negrín arrived in America, stopping in Washington and New York on his way to the United Nations Conference on International Organization. His presence in San Francisco at that time was interpreted by the liberal press as a hopeful sign for Spain. A *PM* editorial lauded the San Francisco rejection of the Franco regime and applauded Negrín's plan for establishing a government-in-exile. By July Negrín was in Mexico working with Republicans there. Meanwhile, anti-Franco sentiment continued to grow on an international scale. The Potsdam conference decision on Spain was considered a major blow to Franco's reign. The joint communique of the Big Three barred the admission of Spain to the United Nations organization because the Spanish Government, "having been founded with the support of the Axis powers, does not, in view of its origin, its nature, its record, and its close association with the aggressor states, possess the qualifications necessary to justify such membership."

The New York *Herald Tribune* carried a series of articles in August 1945, "Spain Under Franco," in which the author, John Chabot Smith, stated, "It is said in Spain that 95 per cent of the people are opposed to the Franco regime." J. Alvarez del Vayo, last Republican Foreign Minister, discussed Negrín's plan for Spain in the *Nation* (July 21, 1945). "His dominating concern," said del Vayo, "is to bring about the restoration of the Republic with a minimum of violence and to establish rapidly the peace and order necessary for reconstructing the country." In August he told a Republican meeting in Mexico City that he would be willing to resign to expedite unity. Later that month when Diego Martinez Barrio was installed as provisional President of the Spanish Republic before the exiled Cortes (Parliament), Negrín urged a government of all parties to work toward the restoration of the Republic, and he and his Cabinet resigned, according to custom. A few days later when José Giral became Premier, it is reported that his first act was to call on Negrín to induce him to join the new Cabinet as Foreign Secretary. Negrín's refusal caused considerable speculation as to dissension within the Republican bloc. However, Negrín is not opposed to the Giral Government; and according to an article by Owen Roche (*PM*, September 5, 1945), his absence is due to the following reasons: "1) to remove any cause for red-baiting; 2) to eliminate the fears of British and other investors in Spain; 3) to enable him and his followers to return to Spain in the best position to accept a mandate from the Spanish people themselves." In her book *Smouldering Freedom*, published in early September 1945, Isabel de Palencia '41 stated that there can be no doubt that Negrín "has the support of the majority of Spanish Republicans in exile and probably of those within Spain also."

After having consulted with Under Secretary Dean Acheson at the State Department in late December 1945, Negrín proceeded to Paris where members of the Spanish republican Government-in-exile were gathering. He has steadfastly insisted on the legitimacy of the present Government-in-exile, but in the opinion of many observers he will use his influence to make it more representative of the Spanish resistance groups than it has been.

The Spanish democrat, a man of vigor and "exceptional versatility," is described by one writer as "that strange phenomenon, an active scholar, a curious mixture of scientist and businessman, an intellectual and an organizer." A fluent linguist, Negrín speaks English, French, and German, and understands Russian. He writes little, but did contribute an article to *Free World* in January 1943, "Science and Statesmanship," in which he stressed the necessity for a union between science and statesmanship in order to achieve reconstruction and a lasting peace. A man of modest manners with a lively sense of humor, Negrín is reported to have appeared to Churchill '42 as "one of the ablest statesmen in Europe." Negrín's family has been in America since 1939; his wife María and son Miguel were in New York City to greet him when he arrived in May 1945. Another son, Juan, is a brain specialist in a New York hospital.

NELSON, (JOHN) BYRON (JR.) Feb. 4, 1912- Professional golfer

Address: b. c/o Haas-Jordon Co., 1447 Summit St., Toledo, Ohio; h. Route No. 2, Denton, Tex.

BYRON NELSON

Voted the outstanding golfer in the United States in 1943 by fifteen leading fellow professionals, and named in December 1944 the male athlete of the year by seventy-nine sports writers throughout the country, Byron Nelson broke golf records in 1944 by averaging less than seventy strokes on eighteen holes in seventy-eight competitive rounds of big-time tournament. Called "the master of the iron shot," Nelson succeeded Gene Sarazen as the second golfer who won first place in the fourteen years' history of the sports writers' poll. Biggest golf money-maker in 1944, he won more than forty thousand dollars in war bonds in prizes. He played even better golf in 1945. Winner of the national professional golfers' championship and of eighteen other tournaments, he was named the world's No. 1 male athlete of 1945 in the annual Associated Press poll for the second consecutive year.

The son of John Byron and Madge Marie (Allen) Nelson, John Byron Nelson, Jr., was born February 4, 1912, near Fort Worth, Texas. Young Byron's at-homeness on the golf greens dates from his early teens, when he caddied after school hours on the local courses, and also managed to play a few rounds of golf with the other boys when the backs of the club overseers were turned. From the time it became clear to him that "practice makes perfect" he spent all his spare hours on the links. After his graduation from the Polytechnic High School he got a job as a file clerk in the accounting office of the Fort Worth and Denver Railroad. Although his job left him much less leisure time, Nelson nevertheless worked in a lot of golf practice. He played over week-ends and after office hours, concentrating on his drives and long shots until sundown and then putting on the green until it became dark, using a white handkerchief to spot the cup.

In 1930, during the depression, eighteen-year-old Nelson was released by the railroad com-

NELSON, BYRON—*Continued*

pany. He then found employment on a bankers' magazine, a job which fortunately gave him more free time for the links. Within a year Nelson reached his first milestone in the golfing world when he entered the 1931 National Amateur at Beverly, in Chicago. Although his practice in Texas had perfected his skill in playing in a wind, it had not prepared him for working on wet fairways. Yet he missed qualifying by only one stroke. The following year, with jobs scarce and golfing more to his liking than any other occupation, Nelson turned professional in the latter part of 1932 to play in the five-hundred-dollar Texarkana Open (held in the city on Texas-Arkansas border), where he finished third with a prize of seventy-five dollars. Then, touring the tournament circuit in California in the winter of 1932, Nelson accumulated winnings reaching the grand total of twelve dollars and fifty cents, a share of the last money prize in one of the tournaments. With his lean reserve ebbing away and his winnings small, Nelson embarked on a rather stringent diet, making many meals of bars of chocolate. Ironically, he came to be known as the "Kandy Kid" by friends who, ignorant of his dire straits, thought he had an extremely sweet tooth. Nelson attributes his poor playing at that time to an unbalanced diet. Often playing through the early stages of tournaments under seventy, he would lose control of the necessary body coordination and clarity of mind as the session wore on. Some said he had "lack of heart"; he knew it was "lack of stomach."

In 1933 the Kandy Kid accepted the Texarkana Club's offer of the job of club "pro," a position which promised a steady salary. With three regular meals a day and few financial worries, good fortune began inching toward Nelson. During 1934-35 his winnings jumped from $924 to $2,708. In that year, too, he was married, to Louise Shofner, also a golfer. Later that season he became affiliated with the Ridgewood Country Club in New Jersey. In his last year with this club (1936) he won his first major tournament, the Metropolitan Open at Quaker Ridge in New York State. From 1937 to 1939 he was pro of the Reading Country Club in Pennsylvania; from 1940 to 1944 he was pro at the Inverness Golf Club in Toledo.

It is the opinion now of most golf experts that although "some can outputt him, some outdrive him, and some exhibit prettier form, Byron Nelson is 'King of Golf' because he hits his peak just when you think you have him licked." In almost every instance, either when apparently defeated or confronted with a difficult shot, he emerged a victor. In the 1939 National Open at Spring Mill, Philadelphia, Nelson lagged behind six strokes after the first thirty-six-hole play of the tournament. There were twelve men ahead of him as the final two rounds began. At the end of the two rounds Nelson was tied with Craig Wood and Denny Shute for a total of 284.

In the play-off for the championship the contestants had been whittled down to Nelson and Wood. At the end of the first eighteen holes they broke even. In the next round Nelson picked up a two-stroke lead on the third hole by pitching a long approach shot to within a yard of the pin for a birdie three. On the fourth, where he was outdriven by Wood, Nelson put the ball right into the pin from a downslope position 215 yards from the green. According to Robert M. Yoder and James S. Kearns, in the *Saturday Evening Post*, "Nelson was gambling heavily on his ability to hit the exact shot the situation demanded. What he produced was a good example of the Nelson Emergency Special, the kind of shot he performs best when the situation is tough. . . . With a brisk cross-wind blowing, he hit a low-line drive, drawing it through the wind with just enough hold to curve over the front corner of the green, right into the hole." Nelson finished the round with a seventy and the championship. He had played the seventy-two holes in 277, four strokes under the best golf ever played for the regulation four rounds of a National Open. (That same year he also won the Western Open.)

In 1940 Nelson won the top golf tournament, the Professional Golfers' Association match at Hershey, Pennsylvania, only to lose it the following year to Victor Ghezzi. According to Nelson's own analysis, he had played the game "too safe." In the 1942 Professional Golfers' Association match in Atlantic City Nelson lost the game on a twenty-inch putt. Had the putt been a twenty-foot one, his followers claim, the "Crisis Kid" would have made it. He also lost the P.G.A. match in 1944, but won again in 1945.

That same year, 1942, Nelson won his second Masters' championship at Augusta, this time defeating Ben Hogan. (In 1937 he had also been a winner.) This second match forced Nelson to use every bit of skill and good judgment he possessed. At the end of thirty-six holes he was eight strokes ahead of Hogan. After seventy-two holes they were tied at 280. Handicapped by a recurring digestive ailment which especially "acts up" when his nerves are taut, Nelson was the answer to his opponent's dream. On the first hole he had a right hook which settled under a scrub pine. The only way to get at it was to play the ball left-handed with the back of his putter. Before he finished the hole he had a six, Hogan four. Ralph Guldahl, a former Masters' winner and two-time National Champion, commented: "This is Nelson's kind of a spot, when he's chasing you, he's really tough." And he was. On the sixth Nelson, now trailing Hogan by three strokes, cut his opponent's lead two strokes by sinking a ten-foot putt for a deuce. In the eight holes following this deuce Nelson was six under par. As Yoder and Kearns put it, "it was one of the Nelson runs that break an opponent's heart."

In the 1942 Tam O'Shanter Open in Chicago—a rally which drew one of the largest galleries in the history of golf—Nelson again displayed some of the tactics which make him "one of the hottest golfers of the day." After achieving a 4-3-1 score against a par of 5-5-3, and finishing the third round at sixty-five, seven under par, Nelson on the next thirty-six gave the game back to his opponent, Clayton Heafner, by chalking up a seventy-seven score against Heafner's seventy-two. In a depressing, discouraging situation and with two thousand dollars at stake, Nelson responded as expected. On the fourth hole on a muddy and soggy fairway, he landed the ball ten feet past the pin, then putted in for a birdie three. On the next hole Heafner's second shot landed near the cup for a sure birdie, but Nelson was in a heavy rough. He lifted the ball out of the shaggy grass with his wedge and bounced it into the cup for an eagle two. With the next hole, a birdie for both contestants, Nelson won the prize money.

According to Tommy Armour, who has held every major open title in the world, "Even when Nelson is only half-way putting, he can't be beaten. He plays golf shots like a virtuoso. There is no type of problem he can't handle. High shots, low shots, with the wind, or across it, hooks or fades, he has absolute control of all of them. He is the finest golfer I have ever seen." This is an almost unanimous opinion of Nelson's playing that perhaps can be attributed to his five requisites for top-notch golfing. Nelson asserts that interminable practice, plus stamina, coolness, unflinching courage in a precarious moment, and a competitive spirit are essential to successful golf play. Says Nelson: "They aren't discovered suddenly; they're developed through long and earnest training and practice." According to him, no golfer gets results on the course unless he keeps regular hours and good diet. Nelson also urges the development of a "golf temperament"—"play the shot you're playing," he says, "not the preceding one." Nelson has learned through experience that golfers harassed by previous mishaps throw the subsequent shots away. He still indulges in pep talks to himself during a tense moment, on the order of, "All right, Nelson, old kid, take it easy. So you've made a bad one. So what? Another bad one won't make it good. Take it easy."

Sport fans are of the opinion that Nelson is a master of the iron shots but is weak in putting, this weakness being ascribed to a tendency to strike short putts with too much force. However, there is much controversy over, and many explanations for, Nelson's alleged "unorthodox cocking of the wrists on the down swing." Tony Longo of the Inwood Country Club finds that Nelson on a swing leads so sharply with his left side that his wrists and hands, with relation to the club head, result in a wrist-cock. All professionals agree that the style is unusual. According to Phil Turnesa of the Metropolis Country Club, "Nelson, tall of stature, and possessed of powerful hands, doesn't need a full back-swing, and the fact that he takes less than a three-quarter arc accounts for his unerring direction from tee to green." Very few golfers attempt to imitate Nelson's peculiar swing because of the unfavorable results they get.

In the first two months of 1945 Nelson played in six open tournaments, in which he won three of them, tied for second in one, and came in second in two of the others. In the Los Angeles Open tournament, a $13,333 war bond event, Nelson lost first prize to Sam Snead, missing a chance to tie his opponent when he faltered on a twenty-foot putt. In this match he tied with Harold McSpaden, winning sixteen hundred dollars in bonds instead of the top prize of $2,666. In the same month Nelson won the Phoenix Open with a score of 274, ten strokes under par for the seventy-two holes. In February Nelson was "a par-cracker" in the Corpus Christi (Texas) Open, scoring sixteen under par, with McSpaden gaining second place. In one of the most interesting tournaments of the winter season, Nelson shot a seven under par when he defeated McSpaden by five strokes in a play-off round for the New Orleans Open. In the Gulfport (Mississippi) Open, golfer Nelson tied with Sammy Snead for first place, but lost the tournament to him in the play-off by missing a sixty-foot putt by two inches on the last hole. The Pensacola (Florida) Open he lost to Snead by seven strokes. This defeat put him one game behind his opponent in the fourteenth tournament of the 1944-45 winter golf circuit.

During the first week in April Nelson set a seventy-two-hole scoring record of 263 on the Capitol City links at Atlanta, Georgia. The match for the mythical world championship of golf opened at Fresh Meadow Country Club, Flushing, Long Island, on May 26, with thirty-six holes of medal play. Defeated by a single stroke, Nelson came back the next day at the Essex Country Club, West Orange, New Jersey, and defeated Snead, four up and three to play. Actually, as the New York *Sun* pointed out, "Snead and Nelson broke even, Snead winning stroke-play laurals at Fresh Meadow and Nelson taking match-play honors at Essex." The big event of the season was the Professional Golfers' championship held at Dayton, Ohio, on July 15. Nelson capped a brilliant season of open tournament play by winning in a test that showed him to be as good a match player as he was a medal player. Although he was hard pressed twice during the match play the Texan made good, sweeping the honors from qualifying to final. In the latter he defeated Sam Byrd, coming from behind to win comfortably under windy and difficult conditions after being down early in the afternoon round of the crucial test. The PGA tournament raised $51,000 for the veterans' hospitals. (Nelson has played numerous matches for the benefit of the Red Cross, the USO, and Bond-selling campaigns.)

On July 30, at the Tam O'Shanter Country Club in Chicago, Nelson won the seventy-two-hole All-American Open, nineteen strokes under par and eleven strokes ahead of his nearest rivals. His award was a $10,500 check, "the richest golf pay-off in the country." In September, while seeking his seventeenth major victory of 1945, Nelson lost the Nashville Open when Ben Hogan, former Air Forces lieutenant, won with the record-approaching score of 265. Then in October Nelson broke his own world competitive record for par-seventy golf courses when he shot a sixty-six for a seventy-two-hole mark of 259, beating par by twenty-one strokes in the final round the Seattle Open. This feat won him $2,000 in war bonds, the first prize in the $10,000 tournament. The day following the tournament the Professional Golfers' Association announced plans to classify golf courses as to championship or nonchampionship qualities, in order to protect scoring records set by its members. The tournament manager, Fred Corcoran, explained, "This is not to detract anything from Nelson's remarkable victory, but there is a difference in courses, and some method must be determined to protect records made on the tougher ones."

(Continued next page)

NELSON, BYRON—*Continued*

Nelson closed out the year in golf on December 16 with his nineteenth tournament victory. He swept over the icy Glen Garden Country Club course with a sixty-six, 77-136 for the final thirty-six holes, giving him a total of 273, eleven under par. The prize of $2,000 in Victory Bonds brought his golf earnings up to $66,000, the largest gains ever made by any player in a twelve-month period. At the end of the year Nelson was named the world's No. 1 male athlete of 1945 by sports writers throughout the country in the annual Associated Press poll. In the words of *Life*, "Nelson has made golf the only sport in the United States that is better than it was before the war. The great Bobby Jones has said, 'At my best I never came close to the golf Nelson shoots.'" As 1945 drew to a close, the sports authority, Grantland Rice, commented on Nelson's victories, and said "the Toledo-Texan should crowd Babe Ruth's '44 top baseball mark of $80,000 before another New Year's arrives." Actor Bing Crosby '41 commented humorously in *Pic*, "If Byron could putt, they wouldn't have to play any tournament. They could just send him the money because he'd win 'em all." Crosby was also quoted as saying that putting is "entirely mental," and that Nelson "thinks he is a bad putter and so he is."

Over six feet tall and weighing one hundred and eighty pounds, Nelson is a large man, has blue eyes and brown hair. He neither drinks nor smokes; he says that such abstinence has been a tradition in his family since the time of his great-grandparents. He enjoys the movies, bridge, and baseball, but is particularly fond of hunting—deer, elk, and quail. In the latter part of 1943 Nelson became vice-president of Toledo's Haas-Jordan Company, umbrella manufacturers. This American golfer, who has held every major title except the British Open, has had the honor of playing on two Ryder Cup teams, an international golf competition between Americans and Britons. Each team consists of ten players, and to be selected a golfer's record and scoring are considered over a two-year period. When Nelson played in 1937 his score was the lowest of the Americans competing in the British Open. In the tournament he placed fifth; but with the war's end he hopes to do something about that score.

NORDEN, CARL L(UKAS) Apr. 23, 1880- Inventor; consulting engineer

Address: b. Carl L. Norden, Inc., 80 Lafayette St., New York City

"Delicate as a pharmacist's balances, fine as a thoroughbred colt, closely-guarded as a sultana—but sturdy as a stone barn"—the Norden bombsight is, in the words of Kurt Rand, "the most discussed yet least known of all the tools of today's war." And its designer, Carl L. Norden, is perhaps the least known of the Second World War's celebrities.

Carl Lukas Norden, who has devoted twenty years to the service of the United States Navy and Air Forces, was born a citizen of the Netherlands in Semarang, Java, on April 23, 1880. When he was five his father died, and the widowed Mrs. Norden took her children back to Holland. Young Carl attended the schools at Nijmegen, a name to be made famous sixty years later by a great battle of the Second World War, and later at Apeldoorn. In 1893, when Carl was thirteen, his family moved to Dresden, Germany, and three years later to Zurich, Switzerland. There the sixteen-year-old boy went to work as an apprentice in a machine shop, where he spent about three years. Then he left the shop and went back to school to prepare for the entrance examinations of the Federal Polytechnical School. He passed them, and was admitted in 1900.

Graduated in 1904 with a degree in mechanical engineering, Norden sailed for the United States, where he was employed by the H. R. Worthington Pump and Machine Works in Brooklyn, New York. Part of the next two years he spent upstate and in Ohio working for affiliated companies, but in 1906 the young Hollander was back in Brooklyn, designing and estimating special equipment for the J. H. Lidgerwood Manufacturing Company. After five years, in the fall of 1911, Norden was engaged by the famed Sperry Gyroscope Company to design the first gyro-stabilizing equipment ever produced for ships in the United States. After its successful test on the United States destroyer *Worden*, the engineer was given a number of similar assignments, including work on the transport *Henderson*, In 1915, when the First World War was already raging in Europe, the thirty-five-year-old designer set up his own establishment in Brooklyn as a consulting engineer. During the next years he furnished the United States Navy with many advanced instruments and devices, such as the radio-controlled target airplanes. Although he devised practical robot flying bombs, these were not put into use because they were considered an inhuman and undiscriminating weapon. It was Norden, too, who designed the catapults and arresting gears for the aircraft carriers, the *Lexington* and *Saratoga.* For these he worked out the first hydraulically controlled landing gears ever made.

The Navy Bureau of Ordnance entrusted Norden with the study of precision bombing problems in 1921. Two years later he was joined by another consulting engineer for the Navy, Theodore H. Barth, who is listed in *Who's Who in America* as "co-inventor of U.S. bombsight." The two formed a partnership, with Barth "putting Norden's ideas into metal." In 1927, after six years of work, Norden's laboratory turned out "a practical timing sight, incorporating optics directly stabilized on three axes," which reduced the usual radial error by 83 per cent. The following year the partnership was succeeded by a corporation, Carl L. Norden, Inc., of which from 1928 to 1938 Norden owned one-half of the stock and was an official. Barth was president of the corporation, and attended to the business and production aspects, while Norden devoted all his time to laboratory research. Their company had only one customer: the United States Navy, which in turn supplied the Army Air Forces. From its beginning on one floor of a New York building, the corporation had by 1943 two entire buildings and also operated other offices, and plants in Indianapolis, Indiana, Easthampton, Massachusetts, and Danbury, Connecticut. When the United States entered the Second World War the company also began to subcontract, supervising production of the Norden bombsight in other factories.

In 1928 Carl Norden was joined in his experiments by the assistant research chief of the Navy Bureau of Ordnance, Captain Frederick I. Entwistle. From that time on the inventor devoted himself to designing and improving aviation equipment, particularly for bombardment purposes. From his laboratory came glide bombing devices, automatic erectors, sights for dive bombing, and radar (radio aircraft detection and range-finding) sights and equipment. (Norden was not, however, the originator of the radar principle.) In 1938 the bombsight now in general use was completely designed and available for subsequent large production. Working in a field where items sometimes become obsolete while in production, Norden had turned out an instrument which was still to be in use years later. This, the most secret and the best known of all his devices—is called simply the Norden precision bombsight, although Captain Entwistle shares the patents and the credit.

Until 1945 this valuable mechanism was "surrounded with the most elaborate and spectacular secrecy, such a ritual of hiding, with armed escorts and oath-swearing guardians, that the forms of protection became a legend, and the bombsight's mere existence a propaganda." To some observers, it is in itself responsible for the Army Air Forces technique of high-altitude daylight precision bombing. "Around the Air Forces schools, where thousands of young men have been taught to use the bombsight," someone wrote while the war was going on, "one of the ancient but favorite jokes is the mock-solemn prediction that, any time now, the Army is going to start giving commissions to the bombsights and leave the bombardiers at home." To a layman, certainly, "bombsight" seems an inadequate word for a handy ninety-pound gadget which can take over complete control of a huge Superfortress, make a series of complicated calculations with lightning speed, and drop the ship's bombs squarely on the distant target. To the bombardier, however, some credit must be given: it takes a man four hundred and eighty-two hours, in an eighteen-week course, to master the use of the instrument.

Underwood & Underwood
CARL L. NORDEN

What is the Norden bombsight? Among other things, it's a device which costs the taxpayers nearly ten thousand dollars, can be carried by one man, is standard equipment on all United States multi-engined bombers, and contains some two thousand parts—"a bewildering confusion of gears, mirrors, cams, lenses, wires, prisms, bearings, and a myriad of tiny parts," all machined to extremely fine tolerances. The lower half, usually fixed permanently into the plane, is a stabilizer. In the one-half cubic foot space in its castings there is a horizontal gyroscope, with azimuth control. The upper part—the sight proper—was carried aboard the plane, during the war in a crate, under guard, never uncovered while on the ground, and returned to the bombsight officer after the mission. One unit is a vertical gyroscope; the other includes a telescope, to sight through, and the computing apparatus. As the target is approached the human bombardier adjusts the sight for the weight of the bombs, the airspeed, and the altitude; sets the gyroscope spinning with its axis perpendicular to the ground; lines up the target through the

NORDEN, CARL L.—*Continued*

cross-hair sight, which turns the plane automatically in the right direction. This last operation, by means of the Norden automatic pilot, keeps the plane on the proper course. All compensation for the plane's forward motion, for its drift, and for motion of the target, is made automatically. Then "Bombs away!" and the bombsight gives the plane back to the pilot, while the bombardier reflects that with it he could "drop a dime into a pickle barrel at fifty thousand feet."

The engineer who made all this possible was honored for his "valuable devices which should hasten the peace" by the American Society of Mechanical Engineers in November 1944. He was awarded the Holley Medal, given annually to "one who, by some unique act of genius of an engineering nature, has accomplished a great and timely public benefit . . . meriting the highest honor within the gift of the mechanical engineering profession." Norden, who emerged from his self-imposed obscurity just long enough to accept the honor and then went right back to his laboratory, revealed in his brief acceptance speech that all patent rights, models, and designs for his immensely valuable inventions were turned over to the United States Government for the nominal payment of one dollar apiece. "These many individual dollars," Norden added, "I never received. But it occurred to me that this very evening, through your great kindness, they have indeed been paid with compound interest."

Less than a month later the name of Carl L. Norden, by virtue of the Carl L. Norden firm, was again in the news, in connection with a Federal indictment, although the engineer himself was specifically excluded from the charge of conspiracy to restrict production of the Norden bombsight to the Norden concern. (The defendants involved entered pleas of not guilty.)

Although a first-grade notable, Carl L. Norden is hardly known outside the intimate circle of Army, Navy, and aviation engineers. His private life is nearly as well kept a secret as what makes his devices tick. His name is not to be found in any of the *Who's Who*'s, and few know that he is married and has a son and a daughter. In appearance Norden fits the stereotype of a Hollander. A big, heavy-set man, fair-haired, short-nosed, thin-lipped, and heavy-lidded, he has light eyebrows and a thick, blond mustache. Norden has retained his Netherlands citizenship, but he is said to be selflessly devoted to the adopted country he served so well.

NYE, RUSSEL B(LAINE) (nī) Feb. 17, 1913- Author; educator

Address: b. c/o Michigan State College, East Lansing, Mich.; h. 540 Glenmoor Rd., East Lansing, Mich.

In 1945 a young teacher of English was awarded the Pulitzer Prize in American biography for a work that originated as a doctoral thesis. The prize winner is Russel B. Nye, whose first book, *George Bancroft; Brahmin Rebel,* was welcomed as a scholarly study of the nineteenth century historian. Described as an "intelligent, well-organized, superior" biography, the book was considered by the *Christian Science Monitor* "far more than the life of one man, but instead a history of Bancroft's times." The author, an associate professor at Michigan State College of Agriculture and Applied Science, has been teaching college English since 1935. In 1942 he won the second annual Knopf '43 Fellowship in Biography to assist him in completion of the Bancroft study which was then in progress.

Russel Blaine Nye is a native of Wisconsin. He was born in the town of Viola on February 17, 1913, to Charles Henry and Zelma (Schimeyer) Nye. He received his early education in Viroqua, a town not far from his birthplace. Going to Ohio for further study, Nye attended Oberlin College, where he won his B.A. in 1934. The next year he took graduate work at the University of Wisconsin and earned his Master of Arts degree. At that time he obtained a position as instructor at Jordan College, where he remained for a year. In 1936 he returned to the University of Wisconsin, joining the faculty as an assistant instructor. Nye accepted a similar position three years later at Adelphi College in Long Island, a post he left in 1940 for his present professorship at Michigan State College. During much of this period he had been working on his doctoral thesis, a study of the life and times of George Bancroft, and in 1940 he received his Ph.D. from the University of Wisconsin.

After having completed this thesis, Nye became even more deeply interested in his subject and planned to continue his research. His interest in the American historian-diplomat, who founded the Naval Academy and ordered the occupation of California, dates back to Nye's childhood, when he spent hours browsing in his grandfather's library where a large set of Bancroft's writings was a venerated possession. In 1942 the Knopf Fellowship assisted him in the completion of his project. He won the twelve-hundred-dollar grant on the merits of the incomplete manuscript, with the understanding that Knopf would publish the book. Two years later, after the author had spent many months in further research work, studying the Bancroft material in New York, Cambridge, Boston, and the Library of Congress, *George Bancroft; Brahmin Rebel* was published. The writer has remarked that the Bancroft records are "disconcertingly voluminous," for George Bancroft's life covered a long and eventful span in America's history: from 1800 to 1891 Bancroft lived and worked in a growing Nation; educator, diplomat, and politician, he also wrote history—his *History of the United States* was the standard text for two generations of Americans. In the words of his biographer, "he was much more than a writer of history. He was a maker of it as well."

In the preface of his book Nye has explained his method of treatment of the famous nineteen century figure: "I have thought it proper to allow Bancroft, as much as possible, to tell his own story, supplemented by the accounts and impressions of his acquaintances." Most critics admired the scholarship of Nye's biography; according to the *Weekly Book Review,* "it takes its place at once as the definitive biography of the great historian." Comment was also made on the work's panoramic view of the historical, political, social, and educational currents of Bancroft's day. Agreeing that the book was "meticulous and scholarly," Orville Prescott found it written "directly and well, but without any particular grace or charm to lure the reader on," an opinion concurred in by a few reviewers. "Perhaps, however," wrote one of them, "Bancroft is better served by pedestrian lucidity than by epigram." There was some critical discussion about Nye's designation of Bancroft as a Brahmin—a member of the highly cultured and exclusive New England society. Gerald W. Johnson in the New York *Herald Tribune* questioned the author's accuracy in this case, as Bancroft's father was a "slightly heretical minister" and the son "turned Democrat when all the rest of Beacon Street was Whig, which would seem to rule the son out of the caste." To Nye, Bancroft represented "the culmination of the Brahmin tradition of New England, the tradition of Concord, Cambridge, and Boston at its highest, yet he was a rebel against it and could not make his peace with it." While any estimation of Bancroft's place in history is regarded as debatable, his influence as a historian is generally admitted. Most critics also agree that he presents a diverse and interesting study in character. Nye found him "a fascinating, many-sided, paradoxical personality. He was shrewd and realistic, yet a visionary and a dreamer."

On May 7, 1945, Nye received the Pulitzer Prize for the year 1944 for his biography, "teaching patriotic and unselfish services to the people." At the time the Pulitzer awards were announced the book had sold about five thousand copies and another printing was reported a few weeks later. There was some surprise in literary circles when the book was chosen by the Pulitzer board. Previously the annual advance poll conducted by the *Saturday Review of Literature* among thirty-seven critics and editors had given Catherine Drinker Bowen's '44 *Yankee From Olympus* twenty-four votes, and Nye's book two votes.

RUSSEL B. NYE

The teacher-writer in 1945 was working on three projects: a sketch of the American abolitionist, Theodore Weld, and two studies, "Civil Liberties and Abolition" and "Theology in American Poetry." Nye was awarded a Rockefeller Foundation Fellowship for the year 1944-45. The blue-eyed, brown-haired biographer is five feet eleven inches tall and weighs one hundred and seventy-five pounds. He was married to Mary Kathryn Chaney on August 6, 1938; the couple have a son, Peter William. Nye is an independent in politics. For recreation, he prefers golf and baseball.

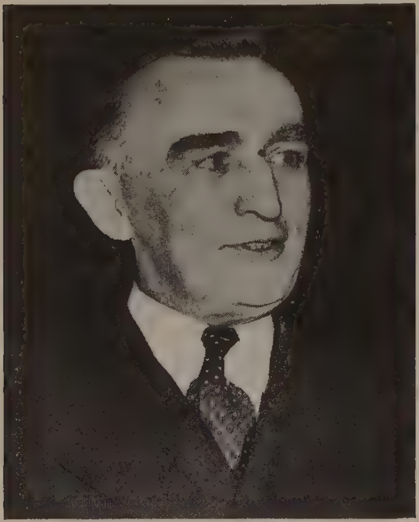
O'MAHONEY, JOSEPH C(HRISTOPHER) (ō-mă'hŏ-nĭ) Nov. 5, 1884- United States Senator from Wyoming

Address: b. Senate Office Bldg., Washington, D.C.; h. 502 E. 22d St., Cheyenne, Wyo.

For more than a decade Senator Joseph C. O'Mahoney has been one of the leading progressive members of the upper house of Congress. A former newspaperman and lawyer, the Democratic Senator from Wyoming is a crusading antimonopolist, having, as the chairman of the Temporary National Economic Committee, conducted an exhaustive survey of the American economy. Among the significant measures he has initiated is the "epoch-making" O'Mahoney-Murray ['45]-Wagner ['41]-Thomas ['42] full employment bill, which was the subject of Senatorial debate in the fall of 1945.



JOSEPH C. O'MAHONEY

The Western Senator is a New Englander by birth. Born in Chelsea, Massachusetts, on November 5, 1884, Joseph Christopher O'Mahoney is the son of Irish immigrant parents, Dennis and Elizabeth (Sheehan) O'Mahoney. The boy attended the Cambridge Latin School in his home state before going to New York, where he studied at Columbia University from 1905 to 1907. He then began a ten-year period in journalism, taking a job as a reporter on the Cambridge *Democrat*. In 1908 young O'Mahoney went West, to Boulder, Colorado, where he became city editor of the *Herald*. After eight years he moved again, this time to Cheyenne, Wyoming, where he took over the city editor's desk of the *State Leader*. He served in this capacity until March 1917, when he was appointed secretary to Wyoming's United States Senator John B. Kendrick, who was also owner of the *Leader*. In the Capital, O'Mahoney took the opportunity to continue his studies. He attended the law school of Georgetown University, winning his LL.B. degree in 1920. (He has since been awarded an honorary LL.D. by Columbia [1938] and Georgetown [1941].) He then returned to Cheyenne to set up his law practice.

While O'Mahoney had joined Theodore Roosevelt's Bull Moose campaign in 1912, since 1916 he has been a member of the Democratic Party. He rose rapidly through the party ranks and by 1922 was vice-chairman of the Democratic State Committee, a position he held for eight years. During the year 1925-26 he represented Wyoming at the conference on uniform state laws, and in 1929 was elected Democratic national committeeman. In the crucial 1932 Presidential campaign, as a delegate to the national convention, he helped formulate the party's platform and served as vice-chairman of the campaign committee. After this initial Roosevelt ['42] victory O'Mahoney was appointed first assistant United States postmaster general in March 1933. But the following December he resigned to accept an appointment as member of the Senate, designated by Wyoming's governor to fill the vacancy caused by the death of Senator Kendrick. Since first assuming office in January 1934, O'Mahoney has retained his seat, having been re-elected for another six-year term in November 1940.

According to Raymond Moley ['45], O'Mahoney, once in the Senate, "neatly telescoped the usual two- or three-year-long novitiate, emerging after a few months as one of the most respected young members." He was a member of the committees on appropriations, Indian affairs, irrigation and reclamation, post offices and post roads, and public lands and surveys. Although once known as "a 100 per cent New Dealer," he came into the national spotlight when he fought against the President's Supreme Court reorganization plan. An article in the *Nation's Business* (September 1938) reported that the Wyoming Senator "wrote the bitter and more acid part of the report of the Judiciary Committee in which the President's plan for reorganizing the Supreme Court was denounced." Long opposed to monopolistic and bureaucratic practices, he has spoken on such issues both in and out of the Senate. It is said that a favorite quotation of the legislator's is a statement from Wyoming's constitution, which reads: "Arbitrary power exists nowhere in a republic, not even in the largest majority." In 1938 his bill requiring Federal licensing for corporations engaged in interstate commerce received wide support. In a radio discussion of this measure, O'Mahoney analyzed the evils of unregulated corporations and called for enactment of a Federal law which "shall clearly define the corporate powers of all interstate corporations." The *Literary Digest* called the bill pro-labor, pointing out that it would grant charters only to corporations which did not practice discrimination against women workers, did not employ child labor, and recognized collective bargaining.

In 1938 Congress created the Temporary National Economic Committee, composed of six Executive and six Congressional members, and headed by O'Mahoney. The chairmanship of the TNEC was called the biggest job of his political career, and the long investigation aroused much discussion and controversy. In the stormy aftermath of the great depression, TNEC, also known as the Monopoly Investigation, studied the concentration of wealth in American industry, seeking to discover why there is "poverty in the midst of plenty." Under the leadership of O'Mahoney and such Administration figures as Leon Henderson '40, Robert H. Jackson '40, and Thurman Arnold '40, the probe was carried on for almost three years, during which time such matters as industrial monopoly, unemployment, life insurance, corporation methods, and technology were examined, and a steady stream of monographs was issued. The *Christian Science Monitor* saw the committee as a "springboard for the advocacy of a wide variety of economic reform ideas and the source of numerous significant economic studies." Shortly before the expiration of the committee in 1941, O'Mahoney proposed the following program: 1) national charters for corporations doing business on a national scale; 2) effective and thorough enforcement of antitrust laws; 3) encouragement of new business and small enterprise by revision of tax laws; 4) a national conference of representatives of business, labor, agriculture, and consumers to concentrate public thought on objectives on which there is general agreement.

With the conclusion of the TNEC inquiry, various estimates of its work were offered. *Business Week,* in an article entitled "TNEC—Magnificent Failure," reported that the committee's monographs had become almost "best sellers" by establishing sales records at the Government Printing Office. A writer for the National Association of Manufacturers attacked the TNEC reports, seeing no reason for "all the fuss over concentration of economic power." One article named as TNEC's one achievement the direction of legislative and business attention to "the choice between two correctives for monopolistic conditions: either tighter antitrust laws to compel increased competition or more Government regulation of individual industries." Writing in the *Nation* (March 22, 1941), I. F. Stone declared that the investigation "will rank with the great inquiries of the past," and called O'Mahoney's summary "a document which deserves to be read by every American." According to this writer, TNEC showed the extent to which the Nation and its institutions "no longer belong to the people who inhabit it." In April 1941 the *United States News* predicted that the TNEC "blueprints for the next reform era" would be laid aside for the duration of the war but were "likely to provide the basic design for numerous postwar reorganization plans."

O'Mahoney's antimonopoly activities include a long fight against the insurance lobby, which won him commendation in liberal quarters. In 1943 he led the investigation of the fire insurance industry's effort to block Federal antitrust legislation by the attempted passage of the Bailey '45-Van Nuys '44 bill. In May of the following year a writer in the *New Republic* stated that the legislator deserved "a Congressional Medal of Honor for statesmanship" for his diligent work in the public interest. In the Senate Judiciary Committee he blocked passage of the bill "almost single-handedly," giving evidence that the insurance industry was "monopoly-ridden." In 1943, as chairman of the Subcommittee on Industrial Reorganization of the Post-War Planning Committee, he again stressed the danger of concentrated economic power. The following year O'Mahoney urged the abolition of the two-thirds Senate vote on treaties, favoring instead a majority vote "which would more nearly approximate the will of the Nation."

Called a "middle-of-the-road" politician, the Senator generally supported the Roosevelt Administration, but voted against it on some vital issues. In 1943 he voted for repeal of the Executive order limiting salaries to twenty-five thousand dollars after taxes; for the anti-strike bill, and then for overriding the Presidential veto of this measure. In 1944 he again voted to override a Presidential veto, this time on the tax bill. Each time anti-poll tax legislation has been under consideration O'Mahoney has signified his opposition: in November 1942 he voted against adoption of closure to limit debate on the bill and prevent filibuster, and since then in the Judiciary Committee he has voted against the bill. However, he believes that the poll tax should be abolished by constitutional amendment, a method which has been criticized as "cumbersome"; in September 1945 he introduced a resolution to submit the question to the States as a constitutional amendment.

On the manpower problem during the war, he favored some controls but not stringent Government control of the worker. The Senate accepted the O'Mahoney-Kilgore '43 manpower bill as a substitute for the stronger May '41-Bailey work-or-fight bill in 1945. During that year the Senator conducted hearings before the Senate Patents Committee and the Senate Petroleum Committee in an investigation of cartels, and introduced a bill requiring registration of international cartel agreements by American firms. In the early summer of 1945 O'Mahoney's subcommittee of the Senate Military Affairs Committee began investigating the operations of the Surplus Property Board, headed by W. Stuart Symington '45.

Columnist Thomas L. Stokes has remarked that O'Mahoney pursues a progressive course on a broad national and international scale, "but he goes Wyoming on the tariff." Noting the possibility that the Wyoming cattle industry is fearful of the Argentine cattle interests, that writer pointed out the Senator's desire for Congressional approval of every trade agreement. In early June the Senate rejected his amendment to this effect, and later that month he voted against the Trade Agreements Law, which nevertheless passed, becoming the first Congressional victory of the Truman '45 Administration. In the fall strong Administration support was being given the full employment bill, sponsored by the senior Senator from Wyoming and his colleagues, Wagner, Murray, and Thomas. This measure, which would establish a national production and employment budget, has been called "the most far-reaching proposal for Government planning that has ever been seriously advanced" in the United States. Testifying on behalf of his bill in August, O'Mahoney warned that only full employment could avert economic crisis. "We cannot afford to drift," he declared. "We dare not take a chance that the soldiers returning from this war will be unable to find jobs. We

O'MAHONEY, JOSEPH C.—*Continued*

dare not risk mass unemployment, for without full employment the capitalistic system will be rocked to its foundation."

The Senator has voiced his opinions widely, through press and radio, and in speeches before various groups. An article in the magazine *Flying* (April 1944) contained his views on aviation's fuel supply. In a radio broadcast in 1943 O'Mahoney predicted that Congress would try to curb the "growing Federal bureaucracy," and, while suggesting no "invasion of Executive authority," he called for judicial review of administrative decisions. In similar vein was his article in *Reader's Digest* (August 1943), entitled "America Is Being Made Over—And We Won't Like It." Here he again objected to the current use of Executive authority, stating: "Policies are no longer being determined by the people or their representatives but through Executive order by employees of the Executive arm of the Government." O'Mahoney has a reputation as an incisive fact-finder and a courteous but thorough inquisitor.

His committee assignments in 1945 include Appropriations, Indian Affairs, of which he is chairman, Judiciary, Military Affairs, Patents, and Public Lands and Surveys; he is chairman of the special committees to investigate the wool situation and petroleum resources, and is a member of the Special Committee on Post-War Economic Policy and Planning. As a member of the subcommittee of the Senate Irrigation and Reclamation Committee he voted against the Truman-sponsored bill for the creation of an MVA because it "delegated to a distant board power over the intimate lives of the people of the region." In October 1945 he introduced a resolution asking Congress to support American participation in a "universal international agreement to outlaw the use of the atomic bomb."

The senior Senator from Wyoming is a member of the American Bar Association, and his fraternity is Phi Kappa Sigma. Mrs. O'Mahoney is the former Agnes Veronica O'Leary of Massachusetts, to whom he was married on June 11, 1913. The legislator is described as a "welterweight" with sandy hair and penetrating gray eyes. A well-liked Washington figure, he is known for his unaffected warmth, sincerity, and good humor, one "who speaks for the wide open spaces of Wyoming with a Boston accent."

OPPENHEIMER, J. ROBERT Apr. 22, 1904- Physicist

Address: b. c/o University of California, Berkeley, Calif.; h. Eagle Hill, Berkeley, Calif.

In 1942 a young physicist then unknown to the general public, J. Robert Oppenheimer, was called from his laboratory at the University of California by the War Department to play a leading part in solving the problems of building the first atomic bomb. In 1945, after he had served for two and a half years as director of the atomic bomb laboratory at Los Alamos, New Mexico, the War Department credited him with "the implementation of atomic energy for military purposes."

J. Robert Oppenheimer was born on April 22, 1904, in New York City, to Julius and Ella (Freedman) Oppenheimer. Educated at Harvard University, which he had entered in 1922, the youth received his B.A., *summa cum laude*, in 1926 as a member of the class of 1925. At the same time he was elected to membership in Phi Beta Kappa. The year 1925-26 Oppenheimer spent as a student at Cambridge University; the following year the Ph.D. degree was conferred upon him by the University of Göttingen. Then, in 1927-28, as a National Research Fellow, and in 1928-29, as an International Education Board Fellow, Oppenheimer studied at Harvard University, the California Institute of Technology, and in Leyden and Zurich. His fellowship years spanned a period of rapid development in the quantum theory stimulated by Werner Heisenberg's formulation of the "uncertainty principle" and his new quantum mechanics based thereon; and Oppenheimer worked on many problems deriving from the quantum theory, "both to see what the implications of the quantum mechanics would be," he says, "and to try to extend it into the field of electromagnetic phenomena." In 1928 the physicist was appointed an associate professor at the California Institute of Technology. He was made an assistant professor of theoretical physics at the University of California in 1929 and became an associate professor the next year.

When the positron (a particle equal in mass to the electron but opposite in charge) was discovered in 1932 by the American scientist Carl D. Anderson, Oppenheimer's interest in the general questions of the quantum theory and atomic physics led him to an investigation of the new particle and especially to a study of the creation and disappearance of electron-positron pairs. On the basis of these investigations, Oppenheimer evolved a new theory of cosmic ray showers and drew the conclusion that the bulk of these cosmic rays must be composed of still unknown particles—particles which have since been discovered and named mesotrons. In nuclear physics his experimental work during succeeding years concerned, among other questions, deuteron reactions (now called the Oppenheimer-Phillips Reaction), the peculiarities of the reaction of light nuclei, and artificial radioactivity induced by deuteron bombardment. Shortly before the war began the connections between mesotrons and nuclear forces had come under his investigation. Meanwhile, at the University of California he had risen to the position of professor in 1935, and in 1937 he was promoted to the rank of professor at the California Institute of Technology. Both in Berkeley, where the University of California maintains a large school of theoretical physics, and in Pasadena at the institute, Oppenheimer's work was done, he says, in collaboration with research associates, National Research Fellows, and graduate students—the training of physicists coordinating naturally with the research programs of the laboratories.

In the summer of 1942 (as far as can be gathered from the H. D. Smyth report), Oppenheimer joined the atomic bomb project. Succeeding G. Breit, who had been directing various physical studies which were necessary preliminaries to the designing of the bomb, Oppenheimer was brought into the "Metallurgical Project" of the University of Chicago at that time to expand and coordinate the work begun by Breit—most of which was now transferred to the laboratories of the University of California. "By the end of the summer of 1942, when General L. R. Groves '45 took charge of the entire project," states Smyth, "it was decided to expand the work considerably, and, at the earliest possible time, to set up a separate laboratory." By November the site at Los Alamos, New Mexico, "located on a mesa about twenty miles from Santa Fe," had been chosen because of its isolation and the large area available for proving grounds. Oppenheimer was appointed director, and he arrived at Los Alamos in March 1943.

Despite the handicap of a location devoid of usable buildings and accessible only by a winding mountain road, the task of assembling the necessary equipment—which included "three carloads of apparatus from the Princeton project . . . a cyclotron from Harvard, two Van de Graaff generators from Wisconsin, and a Cockcroft-Walton high voltage device from Illinois"—was completed in short order and the first experiment was performed early in July. Oppenheimer now had under his control "probably the best-equipped physics research laboratory in the world" and "an extraordinary galaxy of scientific stars," in addition to an auxiliary force of nearly six thousand scientific and military employees. "Established," summarizes Smyth, "for the purpose of investigating the design and construction of the atomic bomb, from the stage of receipt of U-235 or plutonium to the stage of use of the bomb, the new laboratory improved the theoretical treatment of design and performance problems, refined and extended the measurements of the nuclear constants involved, developed methods of purifying the materials to be used, and, finally, designed and constructed operable atomic bombs."

Both the War Department and Oppenheimer's colleagues at Los Alamos have praised the physicist's handling of the laboratory, which has been termed by one of the scientists concerned the "true nerve center" of the "Manhattan Project." "The main decisions," this scientist continues, "were made by Oppenheimer, and all proved to be correct. . . .The amazing thing about . . . [his direction of the laboratory was] his ability to keep in touch with detailed developments in every part of the project. It has been my own experience on more than one occasion to see 'Oppy' come down to our office . . . ask to see some piece of work, glance at it for a few seconds, and then make some pointed suggestion." Former Secretary of War Henry L. Stimson '40 cited Oppenheimer's "genius and leadership," and the War Department described him as a leading teacher and a man of "boundless energy, rare common sense . . . possessing tremendous organizational abilities." Another associate has said, "'Oppy' is smart. No one can fool him for a second—he knows more about most of our specialties than we know ourselves. In fact, he's the smartest of the lot in everything."

J. ROBERT OPPENHEIMER

Oppenheimer's resignation as director of the Los Alamos laboratory was announced in October 1945. Although "a little scared of what he had made," he has stated that he has no regrets, believing that in wartime "it was necessary and right for us to make bombs" and that in peacetime atomic energy will be capable of transforming and enriching man's existence. "It is fair to say," he said in an interview, "that no scientist would be honestly or conscientiously a scientist if he believed that the advancement of human knowledge were a bad thing. A scientist cannot hold back progress because of fears of what the world will do with his discoveries." Oppenheimer believes that scientists are primarily humanists, reports Peter Edson, New York *World-Telegram* columnist. "People are inclined to forget that. Scientists aren't interested in the things they do in a narrow sense. It is the effect of what they do on humanity and everyday life that counts. . . .It is the next job given to atomic fission that is important. Dr. Oppenheimer finds it difficult to understand why this subject isn't being debated constantly."

Oppenheimer was a member of the scientific panel advising the committee that drafted the May '41-Johnson Bill, which proposed to set up strict domestic control of atomic energy on the ground that the United States could not otherwise keep its prospective international commitments to control or outlaw the bomb. While he felt that the bill granted a great deal of power to the nine-man commission and administrator who would control atomic energy and that under the bill science could be "stopped in its tracks," he declared that he could see no alternative to such a bill; it was impossible to limit the commission's powers in a field changing so rapidly and so unpredictably. As discussions continued, Oppenheimer stated that a

OPPENHEIMER, J. ROBERT—*Continued*

nation might now set itself up in the business of manufacturing atomic bombs at a cost in the neighborhood of $2,000,000, instead of the $2,000,000,000 it cost the United States.

In an interview in November 1945 the scientist recommended that the United States offer Russia joint control of atomic weapons; saying that "we could afford to put a great deal into the pot" in exchange for the cooperation of all nations, he added that "if the United States and Russia can collaborate on atomic weapons then the back of the problem of world federation is broken." "Let us in this field not insist on national sovereignity," he concluded. "The deadliest danger for all mankind lies in an atomic armament race." In December two hundred scientists, including Oppenheimer, made public a statement offering to cooperate in drafting national science legislation. Their purpose is to serve the national interest by securing the collaboration of the maximum number of qualified scientists in a united attack on the scientific problems confronting the nation.

Oppenheimer was described after the successful conclusion of his part in the war as "terribly tired after three years of the most intense mental strain any man ever had to undergo. Yet he does not show it. His blue eyes sparkle and his smile is human and warm He is nervously tense, but he has probably always been that way. High strung like a race horse." He is of slender build and medium height, has somewhat unruly brown hair, and wears "youngish," almost collegiate clothes. The scientist was married to Katherine Harrison in November 1940 and is the father of a son, Peter. He is a keen horseman and owns a ranch in the Pecos Valley near Santa Fe. Some of his papers appeared in the *Proceedings* of the National Academy of Sciences. He is a member of the National Academy and a Fellow of the American Physical Society and of the American Academy of Arts and Sciences.

OSATO, SONO (ō-sȧt'ō sō'nō') Aug. 29, 1919- Dancer; actress

Address: b. c/o Herman Levin, 5 E. 57th St., New York City; h. 234 E. 52d St., New York City

The dancer-actress co-star of *On the Town,* Sono Osato, says that her favorite review is one of Wolcott Gibbs's, written after her debut in *One Touch of Venus* in 1943: "I can only pay my deep respects to Sono Osato," Gibbs wrote, "a marvelously limber girl . . . who led the dancers and alarmed and fascinated me almost unbearably." For this part, which "kidded the ballet slippers right off the ballet," Miss Osato was prepared by eight years with classical ballet groups.

The dancer's nationality, which Gibbs found "cryptic," is American by birth, but her father, Shoji Osato, was born in Japan, and her mother, Frances (Fitzpatrick) Osato, is of Irish-French extraction. The young couple had met in Omaha, Nebraska, in 1918, when Osato, as the society photographer of the local newspaper, was sent to take pictures of Miss Fitzpatrick, who was visiting the city with her father, Francis W. Fitzpatrick, a Washington, D.C., architect. Fitzpatrick soon continued on his way to California, but his daughter remained behind to marry the young photographer.

The Osato's first child, Sono (the name means "in a garden"), was born August 29, 1919, in Omaha. In 1923 they took her and her sister Teru to Japan, where her paternal grandparents were still living; in September, after only a short visit, they were forced to flee from the earthquake that devastated Japan that year. Four years later the girl went with her mother, sister, and brother Mitsuru ("Timmie") to France, where they lived until 1929. The Osatos' next home was in Chicago; there the father established his own photographic studio and Sono, at the age of ten, began ballet lessons with Berenice Holmes and Adolph Bolm. She had "always danced about everything," she explains, but adds that she was extremely lazy and disliked to practice. In 1934, when she was fourteen, Colonel Wassily de Basil and his Ballet Russe came to Chicago. On his last evening, as was his custom, the Colonel saw several promising dancers, and that season Sono was one of those asked to come backstage at the end of the Ballet's performance. The conversation that the ballet director had with Mrs. Osato after Sono danced has been variously reported, but the result of it was that the first-year high school student joined the Russian troupe as its youngest member.

Among the Russians, Scandinavians, Germans, Italians, and other members of the Ballet Russe, the Japanese-Irish-American girl was called "Osatchka." Arnold L. Haskell wrote at this time that she was "the most fascinating of Japanese dolls, but with a mind and a will to lend interest to her work." Her first bit part was in Massine's '40 *Union Pacific,* which was given its initial performance in Philadelphia the year Miss Osato joined the group. In this ballet, the first American one to be produced by de Basil, she danced the part of the Assistant to the choregrapher's Barman.

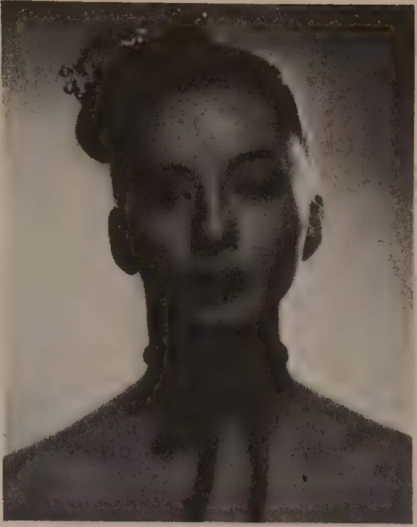
For the next six years Miss Osato toured with the company, dancing six months of each year in the United States and six months abroad. She soon discovered that a ballerina lives no "toast-of-the-Continent" existence, but an unglamorous, exhausting routine of rehearsals and performances, with only occasional evenings of leisure. In her own case, at the time Miss Osato left the company she was appearing in thirty-one out of the thirty-five ballets in its repertoire. Her work in these had given her a standing in the dance world—in the opinion of *Dance,* her most important part was probably as the Siren opposite David Lichine in the *Prodigal Son.* However, notwithstanding her reputation, in her own words, she was "fed up" with working as hard as she had done for fifty dollars a week. Feeling that she could advance no further artistically, she left the Ballet Russe in December 1940.

Miss Osato spent the next six months studying at the American Ballet School in New York. In the fall of 1941 she returned to a paying job, signing with the Ballet Theatre for a reported sixty dollars a week. During the next year and a half she danced a variety of parts. Among them were the queen in *Bluebeard*, Aphrodite in *Helen of Troy*, and one of the three graces in *Romantic Age*. According to *Dance*, she received particular notice in the ballets of Antony Tudor '45, *Lilac Garden, Pillar of Fire*, and *Romeo and Juliet*. In the last, continues the magazine, she danced the part of Rosaline, which Tudor had created specially for her, for it is a character who does not appear but is only discussed in Shakespeare's play. Of her share in the ballet, John Martin of the New York *Times* wrote, "One of the most delightful things . . . was Sono Osato as Rosaline. Though she had no more than two scenes of any moment, she made them one of the best-realized characters in the whole work." When she left the theater to be married in April 1943 to the Moroccan-born designer, Victor Elmaleh, Martin observed, "Too bad, indeed, that Miss Osato has turned her back upon the ballet in favor of domestic life; it is a serious loss to the field."

The reason that Miss Osato gave for leaving ballet was that she did not wish to be always on tour while her husband remained in New York. The summer following her marriage she learned that Agnes de Mille '43 was preparing the ballet numbers for the forthcoming *One Touch of Venus*; this she felt presented the opportunity to dance in a New York production. When she asked the choregrapher, whom she knew, for a part in the musical, she was given the leading dancing assignment. The show opened on Broadway that October, with Mary Martin '44, Kenny Baker, and John Boles as the stars.

Miss Osato's work consisted of three numbers, one of which was a satire on classical ballet ("Foolish Heart") that "stopped the show cold" each performance and caused critics to hail the young dancer as a new star. Said Lewis Nichols of the New York *Times*, "As the première danseuse . . . she is, to be brisk about it, wonderful." "In the first act," wrote the New York *Herald Tribune* critic, "she dances with a precise sharpness in every limb and a rhythmic punch that startles: she is a galvanic comedienne. In the second act she [is] glamorous, alluring . . . quite serious and beautiful." Previously Miss Osato had usually danced either sultry roles or the part of a so-called "bad woman." For *One Touch of Venus*, Miss de Mille had brought out a hitherto undisclosed comedic sense. "Agnes is the most exciting choregrapher I've ever worked with," says Miss Osato, "and I've worked with most of them. Her kind of ballet is so much more alive and meaningful than classical ballet. Here you're making tradition instead of adhering to it." For her dancing in the play, Miss Osato won the Donaldson award of 1944, and shortly after the opening was given featured billing. She remained with the play until the summer of 1944, when she retired for a rest.

When plans were being made to produce Betty Comden '45 and Adolph Green's '45 musical comedy, *On the Town*, Miss Osato was selected for a leading role, and her part, according to the authors, was designed to suit her particular talents. The dances made use of her abilities, also, for choregrapher Jerome Robbins had known her since her Ballet Theatre days, having, for one thing, danced with her in *Romeo and Juliet*. The resultant tailored role, a speaking as well as a dancing one, was that of Miss Turnstiles, one of the monthly poster queens of the New York subways, whom three sailors are trying to meet while on twenty-four-hour passes. The play, which opened in December 1944, received divided comment on its satiric and other values, but the critics were on the whole very enthusiastic about Miss Turnstiles' interpreter. "Miss Osato," wrote Edwin Denby of the New York *Herald Tribune*, "danced in the dream [sequence] and everywhere else with brilliant rhythm and a brilliant sense of shades of character. . . .She is an impish and a warmhearted comedienne, completely natural in the general New York hometown atmosphere [of the play]." She "proves once again," said the *PM* critic, "that she is more than just a good dancer; she . . . is full of the right kind of personality."



Marcus Blechman

SONO OSATO

After her success in *On the Town* Miss Osato felt that she would like to do more acting in the future. (After leaving *One Touch of Venus* she had studied voice and diction.) In September 1945 it was announced that she would leave the musical to appear in a straight part that season, in the title role of *Undine* by Jean Giradoux. The adapter, Schuyler Watts, Arthur Stanton, and the dancer's husband, Victor Elmaleh, were listed as producers.

The extra-professional activities of Miss Osato, who is a member of the American Labor Party, have included campaigning for Roosevelt '42 in the 1944 election, assisting relief groups during the war, and, in 1944, conducting dancing classes for a teen-age group at the Harlem Youth Center of the American Theatre Wing. "Let me assure you," she once told a New York *Post* columnist, "it's not enough just to dance and sing. After all, just because you

OSATO, SONO—*Continued*

are an artist does not mean you are not a citizen, too." Miss Osato was one of the five Broadway performers involved in the controversy that arose when actor Frank Fay ['45] was "censured and reprimanded" by the council of Actors Equity Association.

Sono Osato and her husband live in a New York City apartment that is uncluttered by knickknacks. One of the few decorations in her living room is a Fiji tapa cloth which she acquired on a round-the-world tour; she also has a head of herself by the sculptor Noguchi ['43]. Her favorite colors are yellow and gray-green, and she likes both severe and exotic clothes. For her reading she prefers modern books and plays, and she enjoys swimming and going to the theater or motion pictures for relaxation. The slender five-foot-five dancer has an ivory complexion, and a heart-shaped face, with large brown eyes. She wears her black hair bound close to her head and dressed with bows or flowers.

Miss Osato has a warm personality, her friends say. Her mixed parentage, she states, has never presented a problem to her because she and her brother and sister were reared like other American children. "We were never taught to think of ourselves as different," she once told a *PM* interviewer, "and, nobody treated us as different. People were always curious about us, but that was all." The foreign languages that the dancer speaks are French and Russian, but she does not understand Japanese. On one of her tours the Japanese consul in Melbourne presented her with a bouquet of flowers and made a long speech. "All I could think of to say," she reports, "was, 'Thanks, loads.'"

PAPASHVILY, GEORGE (pȧ-pȧsh-vē′lĭ) 1895(?)- Author

PAPASHVILY, HELEN (WAITE) Author

Address: b. Moby Dick Bookshop, Allentown, Pa.

The true story of one immigrant's delightsome discovery of America and his adjustment to the strange customs of his chosen land is the theme of a 1945 best seller aptly titled *Anything Can Happen*. The authors of this lighthearted little book of "wonder, innocence, and spontaneous wit" are George and Helen (Waite) Papashvily, an obscure couple who suddenly found themselves literary celebrities.

George and Helen Papashvily, products of distinctly dissimilar backgrounds, live in an old Dutch farmhouse in Bucks County, Pennsylvania. The story of how they happen to be living there, of how an American girl and a Russian man met and married and eventually migrated to a Pennsylvania farm, is part of the story of *Anything Can Happen*. George Papashvily was born in Kobiankari, a small village in Caucasian Georgia, sometime between 1895 and 1900. He is proud of his peasant parentage and the fact that his mother was the only person in the village who could read and write. But his mother died tragically in a fire when little George was three years old, and his father could not afford the small fee needed to send the boy to the local school. George's education is described by Roger Butterfield: "He used to follow the other children and sit outside the school door with his dog, trying to catch a few words. The teacher found this out and shut the door. Later George's father gave a precious bag of grain to the local prince (in Georgia then almost anyone who owned much land or property was a 'prince') to teach his son to write his own name. The prince gave him two quick readings of the alphabet and that was the end of his schooling."

George's father was a practical man, however, and had his son trained for two trades—making ornamented riding crops and swords. The boy's apprenticeship to the swordmaker was a hard period in his life; his heavy labor in the unfriendly employer's house was relieved only by his friendship with "Uncle" John. (The latter, George's devoted friend, is one of the most colorful characters in *Anything Can Happen.* He was a great, zestful man, gifted in the art of preparing Russian delicacies.) In the First World War George Papashvily was a sharpshooter on the Turkish front, later becoming an aviation mechanic. He served in the Czar's army for six years and during the Revolution he was in the Georgian national army. Afterward he went to Constantinople, where he "dug wells, drove a taxicab, and hunted wild pig on the Anatolian plains."

Anything Can Happen begins George Papashvily's life story with his entry into the United States in 1923 in the steerage of a Greek ship. During the passage he spent most of his money on extra food but he managed to flash a roll of rented bills to convince the immigration officials of his financial security. On his first day in New York the young man found and lost a job. An employment agency, after convincing him that ornamenting crop handles and making swords were not thriving trades in America, found him a job as a dishwasher. But breaking too many dishes and eating the proprietor's best caviar brought prompt dismissal. There then followed in swift succession jobs in a silk mill, a garage, and a statue factory. When Papashvily tried to improve the statues he found himself again at leisure. He then turned to house painting and later worked in a cleaning factory where the gas fumes bothered him. Sundays found him and his friends in New York's Van Cortlandt Park, enjoying the outdoors and making fires to roast their beloved *shashlik* (a Russian dish made of cubed lamb). On one of these Sunday picnics a flower-picking episode led to a police summons, an incident which makes one of the most hilarious chapters of the book. In court to plead his innocence, Papashvily caused much amusement by addressing the judge as "Your Honesty."

In time New York's cement vistas became oppressive to the Georgian. Consequently, when he overheard some favorable references to Pittsburgh in a subway conversation, he decided to go to that city. There, after a two-month search for work, he found a job in a glue factory, but that lasted only three days. Then the immigrant found himself employed in a strike-bound factory, unknowingly working as a scab. Learning of the true situation, he protested to the employer and eventually joined the picket line. This significant incident in the book has been singled out for special comment by the critics. It is one of the few serious notes in the story.

Papashvily next went to Ambridge, Pennsylvania, where he worked in a railroad yard and a garage. His wanderings began again when he decided to accompany a friend to Detroit. There he worked for several automobile companies and devised schemes to get rich quickly. Once he invested his savings in real estate, only to discover that the lots he had bought were under water. But nothing disillusioned the irrepressible Papashvily. In 1929 when the depression descended upon Detroit, Papashvily and his Russian friends sought to escape from it. They started on a memorable journey to California—in the words of the *Christian Science Monitor* this "trek across the country is irresistible reading." Papashvily found little choice of jobs in Hollywood, and after playing a Cossack in films for some time he decided he could have stayed in Russia and have practically been one. However, he was soon managing a lunchbox business, in the course of which, while selling sandwiches to soldiers on a rifle range one day, the ex-sharpshooter found himself joining the National Guard.

J. Loving

GEORGE and HELEN (WAITE) PAPASHVILY

George and Helen Papashvily first met in California in 1930 when a mutual friend introduced them. At that time California-born Helen Waite was a senior at the University of California and manager of a small bookshop. Her ancestors, cabinetmakers by trade, had come from England and settled originally in Vermont. But her father, Herbert Waite, gave up the family trade and became a contractor in California. When she left the University of California, she joined the staff of Creeds Bookshop in Berkeley, and later managed two other bookshops in that city.

Miss Waite came to New York in 1933 to do bibliographical work and free-lance collecting for two private libraries. She had already been writing for some years, having contributed to several magazines for children. When Helen Waite and George Papashvily announced their intention of marrying, both her family and his friends doubted the wisdom of such a venture. His Russian friends warned him about marrying an American girl, but they were somewhat reassured of George's happiness at the impressive Georgian wedding feast arranged by Uncle John and the bride's bewildered family. The bride was secretly advised on the ways of happy married life by one of her groom's friend: "At least once a day say to your husband 'I love you.' And whenever you set a table for Georgians, remember—only too much is ever enough." The bridegroom was delighted with his newly ac-

PAPASHVILY, GEORGE and PAPASHVILY, HELEN (WAITE)—*Continued*

quired family, declaring with a Russian twist to his English: "Should have everybody a grandmother to make a dignified ornament for the house."

Since Papashvily discovered that in America "they're crazy about any kind of inventions, especially those that work," he has been inventing things. When he was experimenting with some sort of duplicating paper after his marriage, the couple moved to Virginia to be near the place where the necessary material was made. Papashvily imported some chemical from Germany for the ink used in the process until his disapproval of Hitlerism caused him to stop buying German material, which put an end to the experiment. At another time he invented a waterproof cement which he used successfully. During the second year in Virginia, Papashvily entered a contest and, for his brief letter on the qualities of a certain salad oil, won a furnace, stoker, and eight tons of coal. Since the winner had neither the need nor the space for his prize, the oil company presented him instead with a refrigerator. When the Papashvilys moved to Pennsylvania in 1939 and bought their farm, their friends helped them set the house and land in order. (These friends add to the fun of *Anything Can Happen.*) Papashvily forthwith became a farmer, raising successively chickens, goats, bees, corn, sheep, pigs, flax, and finally tomatoes. All this netted the Papashvilys much fun but little profit. But meanwhile, Mrs. Papashvily had the happy thought of writing down some of her husband's accounts of his twenty-year Americanization process, just as he told them. The short pieces, which first appeared in the magazines *Common Ground* and *Direction,* later became part of *Anything Can Happen.* Published in January 1945, the book met an enthusiastic critical reception and became the Book-of-the-Month Club's co-selection for January. That same month *Anything Can Happen* was purchased for a motion picture by RKO-Radio for thirty thousand dollars, plus an arrangement for additional editions sold.

The amazing adventures of George Papashvily form the backbone of the book, and its flesh and blood are the warmth of friendship and optimism, the courageous spirit, and the love of life of the people in it. For these human qualities the book received glowing critical tribute. The critics also called the volume "rollicking entertainment", "tender and funny and deeply perceptive"; and there were those who also considered it an effective force toward the better understanding of immigrants. Several reviewers noted a Saroyan touch in the book, and many appreciated especially this Georgian's love of America and his feeling of good fellowship for all men. John K. Sherman saw in *Anything Can Happen* a "vision of democracy," while Sterling North['43] declared it "a book to make you love America as only an immigrant can love her and to cringe for her brutal aspects as only a citizen with a social conscience can cringe. From the reception of this starry-eyed Georgian (cheated and hoodwinked in the very shadow of the Statue of Liberty) to the moving toast to the United Nations on the last page, this is a story destined to promote international tolerance." The Springfield *Republican* called *Anything Can Happen* "America sunny side up"; Isabelle Mallet in the New York *Times* expressed the same view, declaring that Papashvily "brushes aside with philosophic calm the details of hunger, cold, discouragement, and unemployment." But Miss Mallet also adds: "When we want the Four Freedoms of America poignantly outlined by a poet and philosopher, we'll let George do it."

The language of the book, delightful to some critics, provoked the following remark in the *Library Journal*: "The foreign idiom is not always consistent and the author sometimes takes advantage of it to accentuate his points." Helen Papashvily dealt with this question on a February radio broadcast of *Author Meets the Critics* on which the Papashvilys were guests. On this occasion Bennett Cerf['41] criticized the "phony accent" of the book, which he found apparent in the change from the Georgian-type speech to pages of pure literate English. Mrs. Papashvily explained that she had had no wish to write a "dialect book," that she had endeavored to capture the rhythm and flavor of her husband's language rather than his exact speech. Critic Harry Hansen['42] found some of the situations in the book "obviously synthetic," but the consensus of critical opinion applauded its "naïve humor" and "essential good nature." To those who doubt the veracity of George Papashvily's more unusual adventures, both husband and wife offer firm reassurance of the truth of the story. George Papashvily repeats his belief that in America "anything can happen."

The Papashvilys still live on their Pennsylvania farm, not far from Allentown. There Mrs. Papashvily runs the Moby Dick Bookshop, which they bought in 1939. Not long ago she forced her husband to read English by refusing to read the newspapers to him, but he still does not write English. In his spare time he carves animals in limestone, sandstone, or wood. His work is said to have an interesting, primitive quality. Typical of their natural simplicity was the couple's reaction to their success. Helen Papashvily reveals this in a letter written after they were informed that *Anything Can Happen* had been chosen by the Book-of-the-Month Club: "Your wire came yesterday. Fortunately George was at home because his factory had a holiday. Only he was sitting on top of the ridge pole and I was afraid if I told him he might fall off. So I said, come down and I'll tell you something nice, but he went on pounding shingles and saying, tell me from there. Finally, I got him down and, of course, he was very glad and we sat under the tree being happy for an hour. But then he said I might as well put the other side of the roof on now . . . so he went back on his ladder and I decided I might as well finish making peach jam as long as I was half-way through."

George Papashvily, who has a quick smile, "looks a little like an eagle," has thinning grayish hair, a black mustache under a prominent nose. He calls his wife Elena Gerbertovna, in Russian style. (The second name means daughter of Herbert—the H, which does not exist in Russian, becomes a G sound.) Helen Papashvily is a plump, dark-haired, sweet-faced woman. She has learned to make several Russian dishes, which the Papashvilys serve bountifully to their friends. Their latest plan for the farm is an artesian well, since the "present flow of water is not equal to their Georgian hospitality."

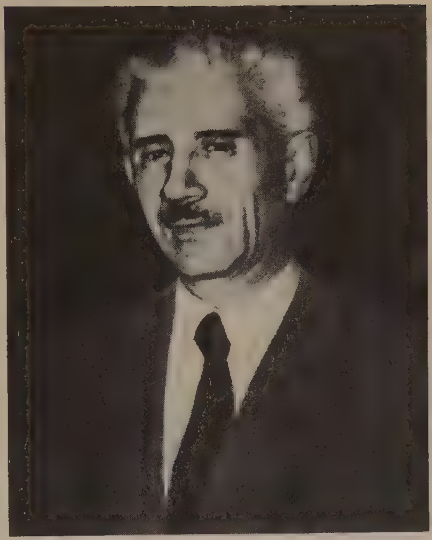
PARRI, FERRUCCIO (păr-rē fā-rōōt′chō) 1890(?)- Former Premier of Italy

Probably the most distinguished record of anti-Fascist and anti-Nazi activity in Italy is that of Ferruccio Parri, Italy's Premier from June to November 1945. Like France's Georges Bidault '45, Parri was a mild-mannered history teacher who has served the cause of freedom as a writer, editor, and general of guerrillas; his underground activities continued unbroken for more than twenty years, of which nine were spent in Fascist prisons. Unlike his predecessors, Parri is from the more advanced and articulate northern section of Italy, where Fascism never attained quite the acceptance it did in the poor and semifeudal south. It was north Italy that was occupied by the Nazis after Italy's surrender to the Allies on September 1943, and it was in Milan and Turin that the patriots rose in April 1945 and drove out the invader.

The future Premier was born in Turin about 1890. In 1915, writes Gaetano Salvemini '43 in the *Nation*, "Parri was an instructor in history in a high school. [Other sources give his field as classical literature.] Tall, pale, with beautiful dark eyes and a great shock of black hair, as severe with himself as with others in the fulfillment of duty, Parri was adored by his pupils." He was in favor of Italy's entrance into the First World War, on the side of the Allies, which he saw as a war to obtain justice for all and to complete the unification of Italy. Entering the Army as a lieutenant, Parri participated in nine offensives, was wounded four times, and received four decorations for valor, among them the Croce per Merito di Guerra and the French Croix de Guerre. Afterward, to quote Salvemini, Major Parri "followed President Wilson's work with enthusiasm. When Leonida Bissolati resigned from the Orlando '44-Sonnino Cabinet because he would not associate himself with its demands for Dalmatia and openly defied the Nationalists and Mussolini '42, Ferruccio Parri took sides with him, while Ivanoe Bonomi '44, who had been Bissolati's follower and friend, betrayed him by taking his place in the Cabinet."

An anti-Fascist from the first, after his discharge from the Army Parri became assistant editor of the liberal newspaper *Corriere della sera* ("Evening Messenger"). In 1925 he resigned because the editor in chief, Senator Albertini, had been replaced by a Fascist; and from that time on Parri devoted himself to secret counterrevolutionary activities against the Fascist dictatorship. In 1926 he was Italian correspondent for the emigré newspaper *Corriere degli Italiani*, published in France by Guiseppe Donati and other anti-Fascists. This work ended for Parri in November of that year, when he and Carlo Rosselli managed to effect the escape of seventy-year-old Filippo Turati, leader of the Socialist Party in Italy. "When . . . all remnants of resistance were suppressed in Italy," Parri wrote in explanation, "I felt it my duty to make a protest which should declare my faith in a better Italy. This protest could only be made public abroad. . . . Signor Turati is well fitted to present to civilized Europe our protest against the darkness that has fallen upon our country and our faith in an Italy which will give equal liberty to all Italians."



FERRUCCIO PARRI

Returning to Italy, Parri and Rosselli were stopped by customs guards at Tuscany, and admitted their complicity in "unauthorized expatriation." Under Fascist law they were entitled to be set free while awaiting trial, but the police interned them on the island of Ustica for a month. Salvemini has given in his article a graphic description of the "conditions of torture" with which the future Premier and his fellow internees were treated. At the trial Parri took the offensive, rousing the courtroom to wild applause, it is reported, by his ringing accusations that the Fascist Government itself had made the step necessary by treating Turati illegally and unjustly. This was the first real challenge anyone had dared offer the Blackshirts, and caused a sensation. The two patriots were given the minimum sentence of ten months' imprisonment, after which Rosselli was again seized and interned. Parri was freed, but the Milan police kept an eye on him, and, says Delos Lovelace, the newspapers on which he worked after that "were generally seized by Mussolini's agents as soon as an issue began to run off the presses."

In all, the future Premier spent nine years in Fascist prisons, of which three years were

PARRI, FERRUCCIO—*Continued*

in detention while awaiting trial. Mrs. Parri, the former Ester Verrua, also served one term. Toward the end of 1930, when other leaders of the underground Justice and Liberty movement were seized and sent to a penal island where they remained until 1943, Parri miraculously escaped arrest, and, "amid the general hopelessness, steadfastly refused to make any compromises with the victorious Fascist regime." (The founding of the Rome-Berlin Axis added to the danger for his Jewish wife.) The coming of the Second World War and the occupation of north Italy by the Germans after the fall of Mussolini only intensified the work of the underground and Parri. "Week after week," to quote *Newsweek*, "he went to bed at 2:00 or 3:00 A.M., rose again at eight, and worked through the day without lunch. When hiding from the Germans Parri sometimes shaved off his black, gray-flecked mustache or changed his glasses." As a leader of the fighting Partisans, or guerrillas, he was best known to the Germans as "General Maurizio," and was also heard of as "Lo Zio" ("The Uncle"). Other war pseudonyms used by Parri were Milanesi, Pozzi, and Pazzolini. He always carried his own bag of secret documents, rather than entrust them to someone else whom the Nazis would be less likely to suspect, as underground leaders did. "An electrical expert and former research director of the Italian Edison Society," *Newsweek* adds, "he organized an elaborate system of radio communication with the Allies in Rome."

More than once Parri slipped across to southern Italy for conferences. Picked up by the Gestapo after one such visit, Parri identified himself frankly as "chief organizer of warfare against Nazism and Fascism." He expected to be executed, but was set free in Switzerland. In one version of the incident, a quick-thinking American major, in the name of General Mark Clark '42, ordered the release of a German general in exchange for that of the white-haired Partisan—or the General's death if Parri were killed. According to Colonel Edward J. F. Glavin of the Office of Strategic Services, the German delivered "Maurizio" and another Italian prisoner in Swtizerland for return to the Allies, as proof of their good intentions in asking for surrender terms. At any rate, Parri went back to Milan and the Partisans—he was one of the highest commanders of this underground, which was said to be one of the most efficient in all of Europe. Later "Maurizio" and several of his colleagues were decorated by General Clark with the Bronze Star, which some Americans considered ridiculously inadequate for the value and difficulty of their services to the Allied cause.

The anti-monarchist and mildly socialistic Action Party, which Parri helped found in northern Italy, is not one of the largest parties, but it is one of the most influential. According to the New York *Post* correspondent Thomas Healy, "Parri's Action Party has always adopted the mediating role" between the Leftists and the parties of the Right, which include the Christian Democrats and the so-called "Liberals" and the Actionists "may be truly said to be the party without 'isms,' whose principles give homage to democracy and permit its expression. Its members—membership costs about a dime—total 120,000 in north Italy and 80,000 in the south. It raised more members of the fighting Partisan armies of the north than any other single party: seventeen divisions, or one-third of the total Partisan forces." In June 1945, when fifty days of crisis had found none of the six parties in Premier Bonomi's Government willing to succeed him, Parri was called to Rome for consultations. A few days later Prince Humbert '43, Lieutenant General of the Realm, designated him to form a new Cabinet. Conservatives had agreed to his selection, reportedly, as the least radical of the Left-wingers and as the most distinguished anti-Fascist.

"I would sooner have been shot by General Kappler," was Parri's reaction, although he accepted the task. As Anne O'Hare McCormick '40 put it, "Nobody wants a job that carries responsibility without power and depends on outside powers who don't know what they want. . . .Nearly half the territory is still under military government, and the rest is only nominally under Italian rule. The regime remains subject to the still-unpublished terms of the armistice, which restrict its political authority and give it almost no economic power. The cupboard is so bare, moreover, that economic control means very little. Italy has no ships, no material for reconstruction, no access to Lend-Lease, no assistance from UNRRA except to a limited number of children and displaced persons."

As President of the Council of Ministers, Parri abolished the title of "Excellency," and was usually addressed as "Professor." After stormy interparty sessions, he took over the important and much-disputed portfolio of the Interior, which controls elections and all local government, appointed the Socialist Pietro Nenni to make plans for a constituent assembly to vote on keeping or rejecting the monarchy, and formed a Cabinet of three members of his Action Party, the same number from each of three others, one admiral, and four of the (Roman Catholic) Christian Democrats—a compromise to reconcile the last-named to a Socialist Minister of Education.

Premier Parri broke Italian precedent by giving the people a frank and dispassionate statement of the facts: "We are still far from the status of a great nation, which our history, importance, and numbers should give us. We must merit that status. It won't be given to us as a gift." The Italians, he said, must work to gain the trust of the Allies: "their trust means bread, coal, raw materials, and credits, . . . the very possibility of our livelihood. This trust will be the base of our ability to govern ourselves." In July Italy declared war on Japan. Despite the Premier's efforts, he was unable to get the Allies to terminate or even to make public the reputedly harsh and hampering terms of the 1943 armistice, under which Italy was still technically considered an enemy nation. It was against this background of uncertainty and of unemployment and the threat of famine that the first free assembly of Italian representatives (designated by their parties) in twenty years opened, in September 1945.

The Premier labored for five months to keep his six-party coalition government united. When the Liberal party, ranked among conservatives, became alarmed at Parri's resolute purge of officials who were tainted with Fascism, two Liberals and one Independent resigned from the coalition. Thus on November 24, 1945, Italy's third national government since the liberation of Rome in June 1944 was dissolved under the weight of conservative attacks when the Premier resigned. Parri warned of a renascence of Fascism and the threat of civil war, eight large Italian cities staged protest strikes, and the United States asked all the political parties to subordinate their own aims to the national interest. Although the Rightist politicians who had forced Parri's resignation waged a high-pressure campaign to replace him with Vittorio Orlando, eighty-five-year-old former Premier, who in 1935 had published a letter praising the Fascist aggression in Ethiopia, on December 4 Alcide de Gasperi, Christian Democratic leader, was elevated to the Premiership. His government retained the coalition of liberation, six parties sharing equally in the new cabinet. It was reported on December 14 that the new government had not altered the course of the Parri regime.

Ferruccio Parri is described as a tall, lean man, spectacled and weather-beaten. He has thick silvery hair, and dark eyebrows and a mustache. The Premier is soft-voiced and, unlike most of his countrymen, he makes few gestures when he talks. He enjoys mountain climbing when he has time, and he smokes about thirty cigarettes each day. Correspondents described Parri at first as "the harassed, poorly dressed professor in politics," but several months as Premier seem to have changed his appearance and personality to that of "a perfect aristocrat." His own description of himself is "an average man—just anybody (*'uomo de strada—uomo qualunque'*)." Thomas Healy, one of his most enthusiastic American admirers, writes, "I have read everything about Parri. He is Italy's great man and will become much greater. He has the qualifications—good sense, intellect, honesty, respect for his given word —and is a true democrat." Another American, Philip Hamburger of the *New Yorker*, calls Parri "a man of pure intelligence. . . .It's wonderful to hear a man . . . use words like 'morality' and 'democracy' and know that they mean something in his mouth."

PARTRIDGE, SIR BERNARD Oct. 11, 1861—Aug. 9, 1945 British illustrator for *Punch* from 1891 until few months before death; considered one of the world's foremost political cartoonists; preferred realism to extravagant emphasis.

Obituary

N Y Times p13 Ag 11 '45 por

PASVOLSKY, LEO (päs-vol'skĭ) Aug. 22, 1893- United States Government official; economist

Address: b. c/o Department of State, Washington, D.C.; h. 3641 R St., N.W., Washington, D.C.

One of the lesser known officials at the United Nations Conference on International Organization, in the spring of 1945, was Leo Pasvolsky, special assistant to the Secretary of State of the United States. An "old hand at conferences," he is considered "one of the principal architects of the Dumbarton Oaks proposals for world peace." He is also credited with drafting the plan for international trusteeships of such conquered territory as is not ceded outright to the victorious United Nations, a plan to which President Roosevelt '42 had committed the United States.

The son of Michael and Maria Pasvolsky, Leo Pasvolsky came into the world on August 22, 1893, in the Black Sea town of Pavlograd, Russia. His father, an anti-Czarist journalist, took part in the attempted revolution of 1905, then sought refuge in the United States after its failure, becoming a teacher of Russian literature. Twelve-year-old Leo learned English as he went along in the New York public schools; he became an American citizen in 1911. Intending to become an electrical engineer, he entered the College of the City of New York, but soon discovered that he lacked mathematical aptitude and therefore concentrated on political economy. In his student days, according to Josef Israels 2d, Pasvolsky lived in "a ratty Greenwich Village apartment above a laundry . . . [but] he served caviar and cheese to cronies and sought out exotic restaurants for a gourmet's appetite."

Since the age of fifteen Pasvolsky had been contributing to Russian-language publications and to those concerned with Russian subjects, and after his graduation from C.C.N.Y. in 1916 he became editor of a monthly, the *Russian Review*. In 1917 he also began to edit a Russian-language daily, the *Russkoye Slovo* ("Russian Word"), and a monthly, the *Amerikanskiĭ Viestnik* ("American Messenger"); and from 1916 to 1918 he pursued graduate studies at Columbia University. Pasvolsky found time also to do some translations from the Russian, notably a selection of eleven of Aleksandr I. Kuprin's short stories, published as *The Bracelet of Garnets and Other Stories* in 1917, with an introduction by his friend William Lyon Phelps '43. That year saw the publication, too, of *Economic Russia*, which he helped to prepare. When *Mentor* Magazine devoted its July 1917 issue to the Russian Empire, it turned to Pasvolsky for an expert summary.

In 1918 Pasvolsky left the *Russian Review* and the *Amerikanskiĭ Viestnik* and joined the War Work Extension of the United States Department of the Interior. He was also a member of the New York City Mayor's Committee on National Defense. Pasvolsky covered the Versailles Conference in 1919 for the Brooklyn *Eagle* and the New York *Tribune*. He remained editor of the *Russian Word* until 1920, after which he worked as a free-lance writer. In this capacity Pasvolsky covered the Wash-

LEO PASVOLSKY

ington Naval Conference of November 1921-February 1922 for the Baltimore *Sun*.

After a study of the official Soviet statistics covering the period from the beginning of the Russian Revolution to the end of 1920, Pasvolsky wrote *The Economics of Communism, With Special Reference to Russia's Experiment*, published in 1921. In his view, the Soviet Union faced the fundamental dilemma that "Communism is impossible without the application of compulsion in the economic life of the country; but economic production is impossible with the application of such compulsion. . . .Either the Soviet regime must give up its Communism in the processes of production and distribution, or else it will be overthrown."

In Pasvolsky's next book, *Russia in the Far East* (1922), he pursued the idea that Soviet Russia "is bound to be, by its very nature, insatiably aggressive and . . . violently imperialistic." A democratic regime, such as the short-lived Kerensky Government of 1917 which was overthrown by the Bolsheviks, was, he felt, "bound to emerge from the suffering country's present tragic trials." He reported the U.S.S.R. "ready to spare no efforts for the consummation" of a disabling war between Japan and the United States, but predicted an economic partnership of those nations with a future democratic Russia in the development of Siberia. He recommended also that the United States exert a stabilizing influence, which would be possible only through "an idealistic international policy."

In 1922 the author joined the research staff of the Institute of Economics in Washington (which was to become part of the famous Brookings Institution by a merger five years later) and assisted in preparing its studies. With Harold G. Moulton '41 he wrote *Russian Debts and Russian Reconstruction* (1924) and *World War Debt Settlements* (1926). In November 1926 the thirty-three-year-old economist was married to Irish-American Christine McCormick of Pittsburgh, who makes even fewer social appearances than her shy husband.

Pasvolsky worked on the Brookings Institution's *Economic Nationalism of the Danubian States* (1928) and *Bulgaria's Economic Position* (1930). His *War Debts and World Prosperity* (1932), written with Harold G. Moulton, presented with "admirable lucidity" the substance of all previous discussions of the topic. Translated into several languages, it became an international best seller; Walter Lippmann '40 called it "the indispensable source book" on the subject. In 1932-33 Pasvolsky studied at the University of Geneva. At this time he was the American member of the International Chamber of Commerce's special committee of economists to prepare the draft report for the World Monetary and Economic Conference. He was a member also of the subcommittee on finance of the Permanent Bureau for Study of Danubian Problems, and acted as special observer for the Brookings Institution. At the conference he presented a paper, *The Necessity for a Stable International Monetary Standard* (1933), advocating an international gold standard (not to be confused with an international currency), based on "international cooperation to maintain stable relationships," and managed in the same sense as a managed-paper currency.

Pasvolsky developed this idea further in writing an Institution report, *Current Monetary Issues* (1933), on the Washington, London, and Geneva economic conferences. This book met with almost unanimous praise, a typical reaction being this (from the *New Republic*): "One is impressed throughout with his [Pasvolsky's] fairness and competence in the analysis of issues and in the interpretation of conflicting positions. While leaning obviously toward a cautious conservatism on questions of monetary policy, he has not allowed his own convictions to distort his reporting." Pasvolsky's belief was that "the only practical means of maintaining stable foreign exchanges is through the operation of an international gold standard based upon fixed gold ratios, unlimited redemption of paper currency in gold at a fixed rate for purposes of international payments, an unlimited market for gold at a fixed price, and free exports and imports of the metal."

In 1934 Pasvolsky was appointed economist in the United States Bureau of Foreign and Domestic Commerce under the Franklin D. Roosevelt Administration. The following year he entered the Department of State as an economist in the Division of Trade Agreements. Politically, according to Israels, Leo Pasvolsky's early record "placed him well to the Left. As he progressed in influence and position, he headed toward center. About 1936 his ideas began to coincide with those of the New Deal, which he had often opposed." In that year he collaborated on Brookings' *The Recovery Problem in the United States* (1936), and was awarded a Ph.D. by the Institution. In that year, too, he was alternate American member of the League of Nations economic committee. And in that year he was appointed special assistant to the Secretary of State, Cordell Hull '40. "Since that time," says *Newsweek*, "very few diplomatic matters have arisen in which he has not had a finger. He is an unobtrusive figure, but the force of his decisions is felt, and the extent of his influence understood, in foreign embassies and legations."

Pasvolsky's position on the official State Department organizational chart is on the same level as the six Assistant Secretaries of State. The reason for his title of special assistant, according to Israels, was to spare the White House "possible wrangling in Congress over a Russian-born expert with a political past as varied as a zebra's stripes." At any rate, the Russian-born expert became one of Secretary Hull's closest advisers and editor in chief of his speeches and diplomatic memoranda. "A spade becomes 'an agricultural implement,'" wrote *Newsweek*, "and the Secretary's picturesque vernacular is transposed into English acceptable for family publications."

In 1939, when the State Department became convinced that war was inevitable, Pasvolsky "was quietly put on the job of organizing new sources of knowledge about foreign countries. . . .Since 1939 hundreds of experts on the nations of the world, both in and out of government, have made contributions to this board, working together under Pasvolsky's general coordination. Millions of facts and opinions on people and nations and politics have been refined through many minds into the over-all knowledge contained in its documents. Pasvolsky has been their human funnel." He is said to be particularly proud of the exactness of his analysis of the long-range trends for the Secretary and the President. (Pasvolsky came in for some criticism in February 1941, in a series of articles Tabitha Petran and William Walton wrote for *PM* on the State Department: "The only one in the economics division who approaches adviser Herbert Feis in do-nothingism is . . . Leo Pasvolsky, special assistant to the Secretary of State on economic affairs. [Salary $8,500]. . . .Mr Pasvolsky clings to pre-World War economics, opposes any regulation of international trade.")

In 1941 Pasvolsky was officially named chief of the Division of Special Research and given larger appropriations. Intensive study groups were set up by him, Under-Secretary of State Sumner Welles '40, and Isaiah Bowman '45, the noted geographer who had helped President Wilson fix post-World War boundary lines. Pasvolsky then turned his attention to postwar problems. He became executive director of the Department's Committee on Postwar Problems, composed of the Secretary, Under-Secretary, Assistant Secretaries, and division directors. According to *Newsweek*, "Functioning as a clearinghouse, the committee farmed out for special study the questions that must be settled at the war's conclusion." Its findings were prepared by Pasvolsky as a formal basis for United States policy on postwar questions.

In August 1943 Leo Pasvolsky accompanied President Roosevelt to his Quebec meeting with Winston Churchill '42. That September columnist Drew Pearson '41 complained that the State Department was "consistently needling" its Russian allies by failing to give them certain information, "cold-shouldering" Soviet and pro-Soviet officials, and conspicuously favoring anti-Soviets; and was also trying to build up buffer states around the U.S.S.R. In these decisions, Pearson declared, Secretary Hull relied heavily for advice on Pasvolsky and Assistant Secretary of State Adolf A. Berle '40, both of whom Pearson classified as anti-Soviet.

Friction developed between Pasvolsky and Sumner Welles, as it had between Hull and the forthright Under-Secretary; and on Welles's resignation, he was replaced by Lend-Lease Administrator Edward R. Stettinius, Jr. '40. When Stettinius succeeded Hull in November 1944, the youngest Secretary of State since George Washington's day found in Pasvolsky "a mind alert to the complex details of international economics and security organization, combined with a skillful anonymity." In addition to his role as Special Assistant to the Secretary, Pasvolsky supervises the activities of the Office of Special Political Affairs. Prior to the January 1944 reorganization the work of this office was organized on a study basis, and as such was fairly well removed from the day-to-day operations of the Department. During 1944, however, it rapidly became a more vital part of the Department's working mechanism. With the time rapidly approaching for the establishment of the United Nations Organization and the Permanent Court, and postwar settlements, in general the work of this office was to become even more important than in the past.

Pasvolsky is credited with an important share in the proposals for a world security organization formulated at Dumbarton Oaks in August 1944 by representatives of the Big Four among the Allies. There, it is said, he answered Stettinius' every question, from his photographic knowledge of hundreds of documents dated even as far back as a quarter of a century. Josef Israels wrote that he also turned out to be a valuable liaison man with the Soviet delegates. "Russians think like Asiatics," one observer commented, "and it takes a Russian to do business with a Russian." In February 1945 he attended the Inter-American Conference at Mexico City.

New York *Times* columnist Arthur Krock '43 stated that the "trusteeship" plan proposed for adoption at the United Nations Conference on International Organization at San Francisco in April 1945 was also credited to Pasvolsky. Under its terms, "a special committee of the Assembly would provide international administrative machinery for conquered enemy territory that will not be, or has not been, given to members of the United Nations; for areas that were mandated [under the old League of Nations] to enemy and neutral nations; and for colonial possessions which may be ceded to the international trusteeship by the victorious powers." The trustee "would have full rights to establish [military] bases and administer the civil affairs of the population. But it would be responsible to the Assembly committee, and be required to give full access to members of the new security league and to assist the inhabitants to independence." This plan, opposed by the War and Navy Departments for strategic reasons, and by Allies with colonial possessions, was designed to prevent the "no-territorial-aggrandizement" clause of the Atlantic Charter from becoming a dead letter and a mockery, and no one, up to that time, had suggested anything better. At the conreference where he headed the technical staff sent by the Administration, Pasvolsky was one of a five-man subcommittee to study proposals

PASVOLSKY, LEO—*Continued*

for amendments to the Dumbarton Oaks agreement submitted by the countries which had not participated in its formulation. When the United Nations Charter was presented to the Senate Foreign Relations Committee on July 9, 1945, it was Pasvolsky's task to detail line by line the meaning of the one hundred and eleven sections of the Charter. A recognition of his work was the Townsend Harris Medal, awarded to him in 1945 by New York City College for outstanding post-graduate achievement.

The mustached and bespectacled Pasvolsky, "a ball of energy," is "easily distinguishable from any direction by his bald pate, stubby, egg-shaped figure, and a long trail of pipe smoke." A shunner of publicity he lives unpretentiously. He puts in brief appearances at the required diplomatic parties, but prefers to spend his free time playing billiards at the Cosmos Club (he belongs also to clubs in London and Geneva). He is said to be a "shark" at bridge for one-twentieth of a cent a point. His fondness for Polish food, especially *zrazy* with *kasha*, has led indirectly to one of his nicknames—"Humpty Dumpty"—in recognition of the two hundred pounds which once covered his five-foot-five-inch frame. A year of reducing brought the Pasvolsky weight down forty pounds. The economist's beatific expression has inspired some Washingtonians to call him "St. Leo," while others, struck by his academic speech, refer to him as "The Brain That Walks Like a Man." The one photograph in his office, that of Cordell Hull, is autographed, "With esteem."

PATTON, JAMES G(EORGE) Nov. 8, 1902- Agricultural leader

Address: b. National Farmers Union Service, Inc., Denver, Colo.; h. 954 Bonnie Brae Blvd., Denver, Colo.

The National Farmers Union, one of the four major agricultural organizations in the United States, has during recent years played a more vigorous and progressive part in the national scene than any of the other groups. Credit for this is given to its young, forward-looking president, James Patton. The membership and influence of the National Farmers Union has grown particularly since the outbreak of the war, when the mobilization of food production became an important part of the national program.

James George Patton, the son of Ernest Everett and Jane Alice (Gross) Patton, was born in Bazar, Kansas, November 8, 1902, the year the Farmers Union was founded by a liberal farm-minded printer and ten farmers in a barn near Point, Texas. During Jim's boyhood the family moved to Colorado, where his father became a mining engineer, and also operated a small farm with indifferent success. The boy went to the Grand Junction High School, from which he was graduated in 1921. He then entered Western State College, at Gunnison, Colorado, where he worked to pay his expenses. Before Patton had finished college his father died, and he was left with a mortgaged farm on his hands, a mother and three younger sisters to support. To add to his responsibilities, he was married in June 1925 to Velma Adeline Fouse. (The Pattons now have two children: Marjorie Jane and Robert Lyle. Two others, James George and George Everett, are deceased.) With his own family to support, Jim Patton's attendance at college was intermittent. He worked at various jobs—he was an athletic director and instructor in physical education in Colorado and Nevada, 1921-26; assistant business manager of Western State, 1927-29; a general agent for a life insurance company in 1931; and organizer of cooperative insurance for the Colorado Farmers Union, 1932-34. He did not get his college degree; but in 1941 Western State College gave him the honorary degree of LL. D.

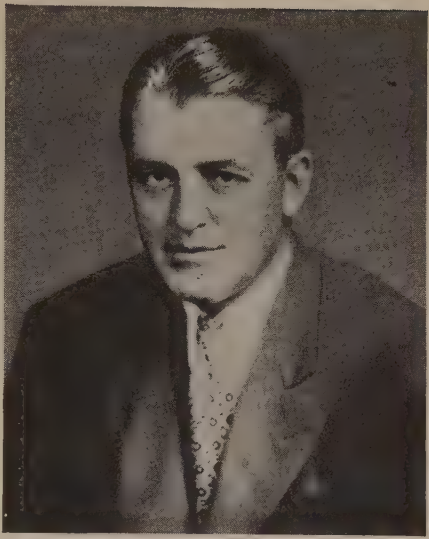
From first-hand experience Patton knew the difficulties of the small farmer; he had also grown up in a community where there was a thriving cooperative movement among farmers. In 1934 he began his career as an agricultural leader when he became secretary of the Colorado Farmers Union. Three years later he was made a member of the board of directors of the National Farmers Union, and that same year he became president of the National Union Security Association (Fraternal Life Insurance Society), of which organization he is still president. From 1938 to 1943 he was a member of the advisory committee of the National Youth Administration; in 1942 President Roosevelt '42 appointed him a member of the Economic Stabilization Board; and in December 1944 Patton was assigned by the President to serve on the War Mobilization and Reconversion Advisory Board.

It was in 1940 that Jim Patton became president of the National Farmers Union—on a trial basis at first, because he was considered rather young for the post. But the probationery basis soon changed to a fairly permanent status: at the end of each term since then Patton has been re-elected to the presidency. The other three major agricultural organizations in the United States are: the National Grange, of which Albert S. Goss '45 is master; the National Council of Farm Cooperatives, guided largely by secretary Ezra T. Benson; and the American Farm Bureau Federation, whose president is Edward A. O'Neal. Unlike these three organizations, the National Farmers Union has always stood for the "family type" farm, as opposed to the very large farm of the "corporate" type. Unlike them, also, it is friendly toward organized labor, and has worked in close relationship with the CIO and the A.F. of L. It was at its 1941 convention in Kansas that the Farmers Union formalized the understanding between its own objectives and those of organized labor. The Farmers Union has stood behind the New Deal aims and policies from the beginning; and, though the New Deal by 1944 had yielded considerable ground to various pressure groups, Patton still held inflexibly to the New Deal program and on several issues went even further than the New Deal. In 1943, according to Paul Sifton, head of the Washington office, under Patton's leadership the National Farmers Union had a membership of 300,000 representing 125,000 low-income farm families, and was rapidly increasing. The Union has member-owned cooperatives in twenty-six states, with assets of $100,000,000. They handle oil, insurance, crops and farm supplies, and are organized along Rochdale plan lines—one stockholder, one vote (the principle of the cooperative store established in Rochdale, England, in 1844). The headquarters of the Union are Denver, Colorado.

In 1942, when food production was being mobilized to meet the needs of a country at war, the stand of the Farmers Union was initially taken when Patton decried the demand for higher farm prices. The war effort, he said, required national unity and not "partisan hog-trough tactics by farmers, labor, or big business." He particularly criticized President Edward O'Neal of the American Farm Bureau Federation for having complained that agriculture was not getting parity prices. In September of that year President Roosevelt called the spokesmen of the four big farm organizations to Washington to get their views on farm prices and procedures. O'Neal, representing the higher-income farm families, was not on good terms with labor, but knew that Patton had the labor union support. When Patton said that organized labor and the farmers could be brought together on wages and fair ceiling prices, O'Neal contested the statement. The dispute between the two men was by no means their last battle. Patton early took up the cudgels in support of the Farm Security Administration, as opposed to the desires of the large-scale commercial farmers, led by O'Neal, who had a powerful lobby in Washington. According to *Time* (September 14, 1942): "If a workable form of inflation control is developed, Jim Patton, the only farm leader who was willing to play ball, may well turn up as a much bigger figure against the background of plowed fields."

In a speech on December 29, 1942, Patton further stated his stand. "Such political democracy as we have—and few nations have as much—is threatened by stubborn refusal to accept economic democracy in agriculture and in industry. . . .And, solely as peace assurance, leaving aside all altruism or humanity, we must attend to the distribution of minimum abundance throughout the world. . . .Have our people's organizations, farmers, labor unions, civic, welfare and religious groups slipped into the habit of expecting the New Deal or the Administration to do our jobs for us? Were we, perhaps, in danger of contracting a 'company union' attitude? If so, that's over. From here on, we're on our own."

Speaking in January 1943, of the necessity of expanding food production, Patton said that Congress had ignored the warning of the Farmers Union and turned down its proposals that three and one-half million dollars be appropriated to expand food production by assisting hundreds of thousands of low-income, under-employed farm families. He said the only way to prevent oncoming shortages was for consumers, farmers, administrative agencies, and Congress to act swiftly to (1) improve and extend rationing machinery and operations; (2) increase the 1943 food production goals by 20 per cent; and (3) pass immediately a special war appropriation of one billion dollars to be used by the Food Production Administration in expanding American agriculture as the "first leg on a three-year program." The National Farmers Union had pointed out that two and one-half billion dollars (roughly equal to the cost of running the war for eighteen days) was necessary 'not only to assure minimum food supplies to the United States and its allies, but also to make good on its promises of food to the liberated nations. . . .A ton of food delivered to liberated peoples is worth its weight in ammunition."



JAMES G. PATTON

At a meeting of the National Economic Stabilization Board on March 6, 1943, Patton urged that the Government give war contracts to farmers as well as industry. Prices must be thought of as directives rather than as goals, he said. "Total war will call for much greater individual responsibility and discipline in what has been an almost unorganized industry." Among the specific proposals Patton made to the Board were the simplification of milk collection and distribution, to save rubber and manpower, complete enforcement of draft deferment of skilled farmers, and the unrestricted use of wheat supplies for feed.

In April 1943 Congress was expected to open a drive to abolish the Farm Security Administration, the agency that had been set up to help small farmers. The National Farmers Union pledged itself to save the FSA, joining with a coalition that included the CIO, the A.F. of L., the Catholic Rural Life Conference, the Federal Council of Churches, and other groups. The Farmers Union Council said that the proposals to do away with the FSA by trans-

PATTON, JAMES G.—*Continued*

ferring its functions to other agencies was an admission that "continuance of its work is vital in production of food to meet our rising war needs. . . .A general who won a brilliant battle for greater food production is going to be shot, virtually without a trial." But the House Appropriations Committee proposed FSA abolition, with transfer of its credit functions to the Farm Credit Administration—an agency that would receive most of its appropriations from the Reconstruction Finance Corporation. Patton was upheld in his protests against this move by Representative Hampton Fulmer, Agriculture Committee chairman, who said that those who approved the fund measure had been influenced by "big farmer" lobbying organizations; and James B. Carey '41 of the CIO said the whole thing was designed to "extend commercialized agriculture and the plantation type of farming." On April 15 a House bloc was formed to save at least the framework of the FSA so that the agency's program could be restored in the Senate. In November the fight to save the FSA moved to the Senate following House action which would force the FSA to reduce the number of employees and country officers by half and restrict itself to servicing old loans. Then in May 1944 the National Farmers Union attacked the amended Cooley bill, which would create the Farmers Home Corporation as successor to the FSA. Patton charged that the bill "has not strengthened provisions for rehabilitation loans and supervision above a bare family subsistence level."

On July 25, 1943, Patton again urged that the Government should make war food production agreements with farmers on the same terms as those that have produced world records in industrial war production. Farmers, he said, should be furnished with credit, have assured prices, crop insurance, and priorities in such things as machinery and fertilizer. He charged that the organizations and men who fought the Econommic Stabilization Act were now against the President's anti-inflation program. He also held that it was organized labor and consumers who supported the proposed stabilization of prices and wages and endorsed the Farmers Union proposals for increasing food production.

President Roosevelt again called in the leaders of the four farm organizations on September 15 to discuss a program calling for increased "support prices" to farmers. It was reported that the farm leaders, with the exception of Patton, gave no assurance that they would not oppose all, or part, of the program which the President had in mind. Patton pointed out after the meeting that "support prices" was only another name for consumer subsidies—although the other three farm leaders denied this. O'Neal, Goss, and Benson said that labor was getting too much in ratio to the farmers; and Patton pointed out that although farm income is the highest in history, the lion's share of farm income went to the top third of the farmers. He said that four million small farmers might be squeezed out of production unless credit and aid could be given them, and he particularly voiced his concern over the wheat growers, who had planted without parity payments and with no crop insurance.

A further meeting of the agricultural leaders and the President on October 19 resulted in a "hammer-and-tongs" session. Patton accused the leaders of the farm lobby of "sponsoring starvation" for forty million American citizens by their opposition to food subsidies and advocacy of rising farm prices. He also accused O'Neal and his associates of clearly favoring inflation by their tactics. O'Neal claimed that farmers opposed subsidies because "the Government handout system is neither economic nor conducive to production."

Concerning another angle of the farm problem, Patton charged in 1943 that "the most glaring of wartime wastes of manpower is in agriculture." He said that no national farm organization would defend the labor freezing provisions of the Pace bill, which resulted in farm labor shortages in many areas and a surplus in others. Manpower is also wasted because over a million farm families, according to Patton, are underfinanced, underequipped, and consequently underemployed "from producing war foods at the maximum." He urged immediate restoration of crop insurance and provision for 1944 parity payments, appealing to Congress to "move with all speed to increase food production by at least 20 per cent in 1944."

Early in 1944 Patton, as a representative of the small farmers, expressed concern over the new tax bill, and urged President Roosevelt to veto it as an inadequate measure. "The farmers I represent are buying bonds—as many War Bonds as they can afford. They want those War Bonds to be worth after the war as much as they are worth today. This tax bill will not contribute to that end. With an inflationary gap of twenty-five billion dollars or more, a tax bill that brings in at most only eight hundred million dollars more than the present law is a fraud on the holders of War Bonds." He further attacked Bernard Baruch's '41 plan for postwar reconversion.

There was evidence that Patton was becoming increasingly critical of Administration programs. His newspaper, the *National Union Farmer*, gave front-page space to Wendell Willkie's '40 farm program; and in March 1944 in Chicago Patton said he would advise Republicans to make Willkie their nominee. At the same time there were hints of a split between the Farmers Union and the leaders of labor unions. Patton continued to defend the unions, however, as "people's organizations" when he attacked the National Association of Manufacturers' Postwar Conference as "a pincers movement threatening Congress and democracy." The Administration was also criticized by Patton for relaxing the rationing of meats and other foods in May 1944. Patton regarded this as "surrender to farm bloc isolationists and a serious threat to postwar rehabilitation."

Will Clayton '44, former Surplus Property Administrator, came under attack when it was charged that he had placed the disposal of surplus Government-owned real estate into the hands of the big real estate interests. Patton and others felt that Clayton's setup was "geared to make the operation a speculative land grab for the real estate interests." Patton said that it had been recommended that the disposal of farm land be vested in the Department of Agriculture, but that Clayton declined to do this. On September 19, however, the House of Representatives decided to adopt the Senate's measure of a three-man board for the disposal of surplus Government property. There was a rumor that Clayton might resign, and that, if he did, Patton could "take much credit for forcing him out." But Patton still had a fight on his hands when on November 13 it was announced that the three new appointees to the Surplus Property Board would be under the controlling thumbs of Jesse Jones '40 and Will Clayton. This, Patton said, "would represent a victory for the big business interests which have just finished a bitter fight to prevent the re-election of the President."

The National Farmers Union submitted on August 4, 1944, a five-point program to the War Food Administration, the OPA, and the Office of Economic Stabilization: (1) authorize the writing of an annual agreement between the Government and the individual farmer on what he should raise, and, in return, what he would receive in farm income, technical assistance, and credit for the year; (2) assure the payment of support prices to farmers; (3) establish a two-year support price, at parity, for cattle; (4) coordinate cattle and hog marketing facilities; (5) provide sufficient funds to enable the payment of whatever subsidies are needed.

Several other activities besides those pertaining directly to agriculture have been on Patton's roster. He served on a committee to help underground German labor organizations; he urged President Roosevelt to give serious consideration to the establishment of free ports in the United States as temporary havens for refugees from Nazi Europe. He was active in Russian War Relief work, including the "Write to Russia" campaign. The American Council on Race Relations is one of Patton's interests; and he supported the demands of Negro voters for an antidiscrimination plank in the Democratic Party platform. He was one of the original members of the National Citizens Political Action Committee formed by liberals outside the CIO. It was a Dies '40 subcommittee in Congress that branded Patton's Farmers Union as a "communist-front" organization. During the labor controversy involving Montgomery Ward and Company, Patton served as chairman of the national committee to protect labor rights of Montgomery Ward workers in their efforts to secure compliance with War Labor Board orders by the company. Early in 1945 Patton was also a member of the board of Americans United for World Organization, Inc., which opened a national campaign to rally support for establishment of an international organization to enforce the peace. When President Roosevelt's nomination of Aubrey Williams '40 to be Rural Electrification administrator was rejected by the Senate in March 1945, Patton indicated that the Senate's action would be used as the starting point of an intensive national organizing and political campaign by the union in the South.

In connection with hearings of the Senate Food Investigating Committee in April 1945, Patton warned the chairman, Senator Elmer Thomas, of the "extremely dangerous threat to economic stability involved in the tone of the investigation and the resultant delay in extension of price control legislation." Patton said further that the "unreasoning fear of hunger aroused by the character of the Senate hearings could have a highly undesirable effect upon our international relations at this most critical time." He declared the only real problem to be distribution, "because farmers, by their magnificent efforts during the war, have broken all production records."

After the war's end Patton again stressed the necessity of sending supplies to war-stricken people. "If we are interested in preventing the growth of any type of totalitarian government," he stated in *Look,* "one way to do it is to see that genuine free democratic processes are available to all citizens." However, he declared that America's principal weapon against radical action—Right or Left—was to furnish "much more food, clothing, fuel, and shelter than we now seemed prepared to do." In November the National Farmers Union recommended a program intended to give "adequate credit" to the Second World War veterans. Patton estimated that one million members of the armed forces would be seeking farms or farm employment.

Perhaps the most far-reaching proposal made to date by Patton was that offered on August 7, 1944, in connection with the Kilgore '43 Demobilization bill. The proposal submitted through the Farmers Union, was in the nature of an amendment to the Kilgore bill to authorize the Government "to invest and spend the amount by which prospective investment and construction expenditures in each year fall short of forty billion dollars, the annual volume required to maintain full employment." This plan would permit the Government to spend money, when necessary, to make up the gap between the amount invested by private enterprise and the amount necessary for full employment. This would be done by offering, through the Reconstruction Finance Corporation, loans to private industry at low rates, and, if industry did not absorb the balance, the slack would be taken up by a public works program. It was called "the first concrete plan advanced by a prominent and influential political figure to bring about the goal of full employment." Said Patton: "The National Farmers Union believes the American people prefer to go forward to full employment, prosperity, free enterprise for all, security and peace." Favorable comment on the plan came from Chester Bowles '43, Frances Perkins '40, Michael Straus, and Leo Crowley '43.

The president of the National Farmers' Union, in the words of a writer for the New York *Post,* "has one curious extravagance: buying oil paintings, particularly marines and mountain views." His reading is said to consist largely of technical books on farming and theoretical volumes on the nature of American culture.

PAUL-BONCOUR, JOSEPH (pôl'bôN" kōōr' zhō-zĕf') Aug. 4, 1873- French statesman

Address: b. Consultative Assembly, Paris; h. Saint-Aignan, Loir-et-Cher, France

"A gentleman of the old school with an oratorical manner," Joseph Paul-Boncour was sent to San Francisco in April 1945 as a member of the French delegation to the United Na-

JOSEPH PAUL-BONCOUR

tions Conference on International Organization. For more than three decades he has been a familiar figure in French politics and international affairs. An outstanding lawyer, former Socialist Deputy and Premier, in 1940 he was leader of eighty former parliamentarians who voted in Vichy against plenary powers for Marshal Henri-Philippe Pétain '40. Shortly after his appointment to the Consultative Assembly in November 1944, Paul-Boncour was made chairman of the commission for the study for France of the Dumbarton Oaks plan, a post for which he had been well prepared by his many years at Geneva as a delegate to the League of Nations Assembly.

Born in Saint-Aignan, in the department of Loir-et-Cher, on August 4, 1873, Joseph Paul-Boncour is the son of middle-class parents. After making a brilliant university record and receiving the degree of Doctor of Laws, young Paul-Boncour was admitted to the Paris bar. He was to become one of France's most famous lawyers—his clients included notables like Queen Marie and her son Carol '40. His political career began in a sense when he served as private secretary to Waldeck-Rousseau during the latter's premiership, from 1899 to 1902, and later to René Viviani when the Socialist was Minister of Labor (1906-9). "In an atmosphere still charged with the emotion roused by the Dreyfus case, young Paul-Boncour became an opponent of militarism, nationalism, and reaction in all its forms"; it is a fight he has waged consistently throughout his career.

He was thirty-six when in 1909, as an independent Socialist and a follower of Paul Painlevé, he left Viviani to take a seat in the Chamber. His success in that turbulent assembly was instantaneous, and two years later, in 1911, he became Minister of Labor himself in the Radical Monis Cabinet. This promising political career was interrupted a few years afterward by the First World War. As commander of an infantry battalion, the French statesman won the Croix de Guerre and was made a Chevalier of the Legion of Honor. But in spite of these honors, on his discharge from the Army he renewed his fight against militarism with greater ardor.

In 1919 he had joined the Socialist Party as fulfillment of a promise he made to the Socialist leader Jean Jaurès a few months before the latter's assassination in 1914. His friends had warned him that by declaring himself on the side of the Socialists Paul-Boncour was throwing to the winds his chances of ministerial promotion. (Even at this point in his career it was realized that he was a potential Premier). Their warnings were not heeded, however; for twelve years, until he was fifty-eight, he was to remain as a member of the Socialist Party, pleading its cause in his "organ-like tones" in the Chamber and the tribunals. His socialistic ideas, in the words of *The Columbia Encyclopedia*, "resemble those of Jean Jaurès; he expressed belief in a gradual evolution of democracy out of the superficial realm of politics into administrative, economic, and social realities. Thus his socialism was based on faith in the ideas of the French Revolution rather than in Marxian theories."

In November 1919 Paul-Boncour was returned to the Chamber as an independent Socialist. (For some time he was to be head of the Foreign Affairs Committee of the Chamber.) He at once joined Léon Blum '40, then chairman of the Socialist Party's executive board and a fellow Deputy, in the Left's struggle against the conservative, anti-Communist National bloc, which had won a decisive victory in the latest elections. Under the successive premierships of Clemenceau, Millerand, Briand, and Poincaré, historians point out, France instituted a policy of anti-Sovietism (despite what Sumner Welles '40 calls "an overwhelmingly 'Marxist' working class" in France), a foreign policy which alienated Britain, and a policy of force in dealing with Germany, which meant a "cordon sanitaire" around that country and, in 1922, a nine-month occupation of the Ruhr. (Briand is described as more of a moderate in his policies.) The Left, on the other hand, demanded in part, "a reversal in foreign policy which should lead to greater cooperation with Great Britain, recognition of the Russian Soviet Government, conciliation rather than force in dealing with Germany." A Leftist bloc was formed to defeat the Nationalists, and in the elections of 1924 the National bloc lost more than one hundred seats, while the parties of the Left were returned in a majority.

Paul-Boncour had been one of those returned as a Deputy, and for the next seven years he remained in the Chamber. In the course of his years in the Assembly, while ministries rapidly succeeded each other, France suffered and recovered from a severe fiscal crisis. Her foreign policy underwent a change: she indicated a willingness to collaborate more closely with Britain; the Russian Government was recognized; cordial relations with Germany were established and a more friendly attitude toward the League of Nations was adopted.

A stanch supporter of the League of Nations himself, Paul-Boncour was sent to Geneva soon after its founding, as a member of the French delegation. His appointment came at a time when the League was trying to carry out one of the most pressing tasks imposed by its Covenant—that of world armament reduction. It was early realized, however, that the member Powers required further guaranties of security. The temporary commission appointed by the Assembly in 1921 to make general proposals for disarmament therefore drafted a treaty which provided for mutual security to be given in exchange for the reduction of armaments. Under this treaty groups of States could enter into regional agreements to support each other if attacked. At the same time they must agree to proportional disarmament. In case of war the Council of the League was to decide which State was the aggressor. This last point was criticized because it did not define aggression, nor give a clear-cut indication of the aggressor. The regional aspect of the pacts was criticized, too, on the grounds that detailed plans for reciprocal military support not only would not encourage disarmament but would authorize the grouping of friendly States against prospective enemies—the latter result in direct conflict with the essential spirit of the League. A month after the rejection of the proposed treaty by the States, a second plan was drawn up—the so-called "Geneva Protocol," adopted by the League Assembly in October 1924.

Paul-Boncour not only gave the Geneva Protocol his vigorous support in 1924, but the spirit of its plan has governed all of his subsequent crusades to establish a potent world organization. This protocol proposed unlimited arbitration among the fifty-four member States of the League; an aggressor was defined as any State resorting to war in violation of the League Covenant or the protocol itself; and provision was made, in accordance with the Covenant, for the use against an aggressor of the economic boycott and possible military action. The defeat of the protocol, F. Lee Benns shows, was due to the fact that most of the States felt in general that it increased the international obligations of the members, a factor which was not seen as desirable in Europe after the First World War.

In 1926 Paul-Boncour proposed the adoption of a resolution which would commit to the League Council the question of defining its own duties and the means of convening for action in case of war. This measure—also defeated—further provided that the permanent consulting commission of the League should consider the means necessary to securing the peace of Europe and, in case of war, the means of placing military aid at the command of the attacked nation.

The role which Paul-Boncour had played at Geneva made him the target of attacks from many members of the Socialist Party, who reproached him with having been at Geneva as the official delegate of a bourgeois government, and who tried to force on him the choice between this role and membership in their party. Following the withdrawal of the Radical Socialist Party's support from the Government in 1928, Paul-Boncour resigned his appointment as head of the French delegation to the League and shortly afterward, in November 1931, resigned his membership in the Socialist Party. (In September he had been elected Senator.) Although the Socialists were bitter over his resignation, many admitted later that he had broken with them chiefly because the party's rigid discipline forbade taking office. After his resignation from the Leftist group, Paul-Boncour did not join another party, but remained an independent of the Left.

After the fall of the conservative Laval '40 and Tardieu governments in 1932, the rise and fall of ministries in the succeeding years, says Benns, was "generally connected with some phase of the Republic's perplexing budgetary, fiscal, or economic problems." In June 1932 Paul-Boncour became Minister of War in the Herriot Government, and on December 19, 1932, he was asked to form a Cabinet, which lasted until the following January 31. (He also served as Foreign Minister.) His appointment as Premier was called inevitable by the London *Spectator*, which considered that he had "every qualification that French politics require." Without great wealth, powerful connections, or social position, Paul-Boncour had risen to the premiership largely because of his League activities. The *Spectator* predicted that he would be governed by the Geneva Protocol slogan: "Arbitration, Security, Disarmament"; the British *New Statesman and Nation* declared that Paul-Boncour was incapable of international thinking because he was "essentially national and patriotic in his outlook."

During the middle 'thirties France was divided between two bitter factions, the Right and the Left. "There was no France any more," says Sumner Welles; "there were two nations." In November 1933 Paul-Boncour was again named Foreign Minister, this time in the Left Government of Camille Chautemps. When this Government resigned in the middle of the Stavisky scandal, Paul-Boncour remained as Foreign Minister in the new Daladier '40 Government, formed in January, which lasted less than ten days. He did not return to the Government again until 1936, when he became Minister without Portfolio in the Radical Socialist Government of Albert Sarraut.

This was the period which saw the beginning of Hitler's '42 rearmament and the triumph of the Popular Front in Spain. In France itself the Popular Front of Leftist parties had been formed against the threat of fascism within the country, and Léon Blum became Premier (June 1936 to June 1937). During his second, much briefer term in office in early 1938, Paul-Boncour served as his Foreign Minister. That spring the sixty-five-year-old statesman resigned his presidency of the Socialist-Republican union, of which he had been head since its formation in 1935, and retired from public life, not returning to the service of his country until after the De Gaulle '40 Government re-entered liberated France in September 1944. After the liberation of Paris Paul-Boncour was made chairman of the Committee of Twenty who selected the sixty members of the Paris Parliament to be sent to the Consultative Assembly. He himself has been a member since November 7, 1944. (During that month it was reported from Paris that an attempt had been made upon his life.)

French representatives had not been present at the Dumbarton Oaks conference nor the Yalta meeting of Roosevelt '42, Churchill '42, and Stalin '42. Foreign Minister Georges Bidault '45 therefore appointed Paul-Boncour as chairman

PAUL-BONCOUR, JOSEPH—*Continued*

of the commission for the study of the proposed world peace organization. The commission was made up of prominent jurists, experts on international affairs, members of the Consultative Assembly, and officials of the Foreign Affairs Ministry. It was the conclusions drawn from this study that prompted France to announce she would not attend the San Francisco conference as one of the sponsoring powers, a refusal reported to be based on her request that the Dumbarton Oaks plan be considered as a basis for discussion and not as a definitely settled project.

Paul-Boncour's analysis of the proposals drawn up at Dumbarton Oaks was published in *Pour la victoire*, a New York French-language newspaper, on March 18, 1945. After expressing his relief at Churchill's assurance that the new peace organization would not be founded on a big-power dictatorship, he pointed out that the small nations, "and, we must admit, not without cause," have shown anxiety over some of the plans, "which are in conflict with the Atlantic Charter and which seem to strike a blow at international democracy. . . .I might say that peace guaranties will henceforth rest exclusively on agreement among the great powers. . . .It is a fact which one may regret, but it must be acknowledged that in the present state of affairs such common action is requisite to peace and that any decision against the wishes of a great power is unlikely to be carried out." He expressed the hope that the time would come when it would be possible to restrain any power, no matter how great. He added: "Nevertheless, evolution is determined by certain principles laid down at the start. It is these principles which give cause for anxiety." Another salient criticism from the man who fought so many years to try to make the League of Nations a potent and effective custodian of world peace is that some of the methods proposed by the Dumbarton Oaks plan are similar to those which the Holy Alliance of 1815 used to crush democracy, "which it is now sought to maintain."

Paul-Boncour's fear in this instance was that the great powers might develop a practice of using their vetoes with a misplaced reciprocity which would paralyze the peace organization. "It may be," Paul-Boncour continued, "that, in view of the chaotic conditions in which the cataclysm will leave the world, nothing else can be done. I sincerely believe this to be the case. . . .Then, by tenacious action, in which I can assure them they will have the support of France, let the small nations endeavor to instill democracy in the somewhat arbitrary institution we are trying to build. The great nations themselves will be forced to help them. Finally . . . let us make sure that democracy will be an irresistible force; that, after preserving it within the nations themselves, it will seem contradictory not to support it throughout the world."

The ex-Premier announced himself on his arrival at the San Francisco conference as an advocate of a permanent international armed force to avoid the fatal weakness of the old League—its "lack of punch." "Peace is impossible," he said, "without a permanent big stick which the Big Five must be ready to use at the first sign of aggression." Paul-Boncour was as good as his word. Following Bidault's return to France, Paul-Boncour became head of the French delegation and drew up the report outlining a practical working program for the United Nations military arrangements for keeping the peace. His report, presented in June 1945, provided "teeth" in its significant amendments of the original Dumbarton Oaks proposals and won the unanimous approval of the conference. The spokesman for France, a land twice the victim of German aggression within a quarter of a century, insisted that the new world organization's forces have "the right of passage." Failure to have this right frustrated France's efforts from 1935 to 1939 to save the peace. Belgium, the Netherlands, and Luxembourg had stood on their rights as sovereign powers not to permit or even to consider French "right of passage" through the strategic areas of their territory which Germany would have to invade to reach France. Similarly, Poland had refused such right of passage to the Soviet Army. Because of the stand of Paul-Boncour and his equally eloquent compatriot, Leon Bourgeois, the Charter specifically mentions this "right of passage."

Two world wars taught France that promise of help is not synonymous with assistance itself. Paul-Boncour succeeded in persuading the other nations that in addition to pledging national armed forces to the Security Council their "degree of preparation and general location" must be specifically mentioned and fixed. Of the nations, Australia, Canada, and Peru principally aided France in improving the Dumbarton Oaks draft. In the most dramatic commission meeting of the conference the French delegate supported with an impassioned address the proposal of Luis Quintanilla, former Mexican Ambassador to the Soviet Union, that Spain be barred from membership in the new world organization as long as it remained under Franco's '42 Fascist domination. James Dunn '43, the American Assistant Secretary of State, joined in this statement to Madrid. It was approved by acclamation by the Commission on General Principles meeting in public session on June 19.

Summing up in his speech during the final plenary session, Paul-Boncour accented the differences between the old League and the new United Nations organization: "The Covenant of the League merely provided for the recommendation of military sanctions involving air, sea, or land forces, and consequently left the nations the option of backing out. . . .In the Charter sanctioned by this plenary assembly, the obligation of all member states to help in suppressing aggression is plainly established. An international force is to be formed and placed at the disposal of the Security Council in order to insure respect for its decisions. This force will consist of national contingents arranged for in advance by special agreements negotiated on the initiative of the Security Council. . . .If called upon to do so by the Security Council, the entire force will march against a State convicted of aggression, in accordance with the provisions for enforcement as laid down for the Security Council." "The United Nations, and more especially the great nations with a permanent seat on the Council, must remain truly united," he further declared. "The whole efficacy of the Charter depends on this unity. In the hour when immense hope rises from our hearts, let us swear to remain faithful in peace to this unity which was our strength in war."

The veteran statesman is the author of several works on government and law. Pictures show him to be lion-headed and somewhat stoop-shouldered. His personality is described as likable and magnetic, and he is said to have no prejudices. Once married to a member of the Menier family, the chocolate manufacturers, he is now divorced. He maintains a country home in his native Loir-et-Cher. One of his favorite forms of amusement is attending the Comédie Française; according to Elsa Maxwell '43, this theater was robbed of a star when Paul-Boncour chose the law and politics for his profession.

PAULEY, EDWIN W(ENDELL) Jan. 7, 1903- United States Government official; businessman

Address: b. Allied Reparations Commissioner, c/o The White House, Washington, D.C.; Petrol Corporation, 756 S. Broadway, Los Angeles, Calif.

The American member of the Allied Reparations Commission is Edwin W. Pauley, President Truman's '45 special representative with the personal rank of Ambassador, a self-made multimillionaire and treasurer of the Democratic National Committee.

Edwin Wendell Pauley was born on January 7, 1903, in Indianapolis, Indiana. When he was six weeks old he was taken to live in Alabama. For his secondary education he was sent to Georgia Military Academy. After his graduation in 1918 sixteen-year-old Ed went West and entered Occidental College, transferring a year later to the University of California's College of Commerce and Business Administration, where he won his letters in football and rowing. He received his B.S. in 1922, and his M.S. in 1923, working his way by selling encyclopedias (whose contents he is said to have "mastered, more or less") and by working as a laborer in the California oil fields. Lowell Mellett '42 writes that Pauley began as a mucker, was promoted to "roughneck," and then, successively, to derrick man, driller, buyer, and refinery evaluator. But what he wanted to do was to teach economics at the university, which he did, until an airplane crash broke his neck, his back, and thirty-two other bones. During his year of hospitalization, Pauley accumulated doctors' bills amounting to nine thousand dollars, which he realized he would never be able to pay on an instructor's salary.

As soon as he was able, therefore, Pauley persuaded some others to join him in leasing an oil refinery. This became the Petrol Corporation of Los Angeles, which branched out into oil production, transportation, and marketing, as well as refining. Pauley became its president. As an independent oil man, he battled established companies on production allotments, emerged unscathed from price wars, and built up what *Time* calls "a sizable business." In fifteen years he had made a fortune of several million dollars, and become president also of the Fortune Petroleum Corporation and Golconda Petroleum Corporation. Some of his business methods have been called into question by political opponents. His salary from Petrol was reported in 1945 as eighteen thousand dollars a year.

Blackstone Studios

EDWIN W. PAULEY

Besides holding oil interests, Pauley was a founder of the People's Bank of California, and served for a time on its board of directors. He is a partner in the John S. Griffiths building firm which developed Lakewood City in California, and is a director of the Griffith and Legg Construction Company. The oil man retained his interest in the University of California, particularly the economics department, and was active on the finance committee. He found time also to enter various yacht races and to win some of them, including the 1939 Trans-Pacific Yacht Race from San Francisco to Honolulu.

Pauley was a supporter of Franklin D. Roosevelt '32; Mellett says that the New Yorker's fight against infantile paralysis had inspired Pauley when he himself was in the hospital. Active in the Presidential campaign of 1932, he was on the NRA's Planning and Coordinating Committee in 1933 as representative of the independent oil men; from 1934 to 1938 he was president of the Independent Petroleum Association. When Roosevelt was campaigning for re-election in 1936 Pauley was particularly active in his behalf; and in 1940 Democratic chairman Ed Flynn '40 asked him to take over the raising of campaign funds in eleven Western states. (Pauley had, meanwhile, been elected a regent of the university to serve until 1955, had served as vice-chairman of the 1938 Los Angeles Community Chest Drive, and had represented the Governor of California at the Pan-American Highway Conference of 1939, on the Natural Resources Commission, and on the Interstate Oil and

PAULEY, EDWIN W.—*Continued*

Compact Commission.) Pauley did such a good job for Flynn that the Bronx leader made him a regional director of the Democratic Party.

Ed Pauley helped organize the California Defense Council in 1941 and was finance chairman of the Los Angeles China Relief. To quote Mellett, when the British were in desperate need of gasoline "Pauley wired the President that one hundred tankers carrying gasoline for domestic use could be released to serve Britain if our rail shipments were properly routed. (His postgraduate thesis at the university had been on the subject of transportation.) The President asked him to report at the White House the next day. Pauley arrived and laid down a plan that would enable the railroads to do more of their job than they had been doing. [Pauley was appointed special representative to act as liaison with Britain on the use of oil tankers.] His plan worked. [With similar status] he promoted, then, the creation of the Petroleum Administration for War with Harold Ickes '41 heading it. That also worked." Pauley helped select the PAW staff of oil men. (In 1941 he became secretary of the Democratic National Committee.)

Pauley was drawn into the operations of Lend-Lease as special representative on petroleum supplies for Britain and Russia, and to work with the British in reporting on enemy petroleum supplies. Mellett says that the Californian "persuaded Sir Arthur Salter, top British shipping man, to revise the wasteful routing of that country's own tankers," and that he also dealt with the Soviet Ambassador, Ivan Maisky. The Russians had requested a large amount of hundred-octane gasoline through Lend-Lease, but Pauley considered it would be preferable for them to adopt certain processes which would enable their own refineries to produce the valuable fuel. As Mellett tells it, Maisky demurred, but Pauley had his way. "The results were what he had promised," and led to "a perfect understanding between Pauley and Maisky." The American spent August and September 1941 in Europe, working on the British oil supply problem.

In 1942 President Roosevelt asked secretary Ed Pauley to become treasurer of the Democratic Party and get rid of its $750,000 debt. The Californian did that: by January 1944 the party was solvent, for "nearly the first time in its history," and Pauley turned his attention to raising a campaign fund. "We will have to spend a lot of money on registering the workers who have migrated because of war work from one community to another," he told reporters. "These workers are our people. Unfortunately they don't pay much attention to registration or registration laws. We will have to get to work on that right away."

Pauley succeeded Ambrose O'Connell as director of the July 1944 Democratic National Convention when the latter resigned in June to accept a Federal judgeship. Each party was allotted fifty thousand dollars for convention expenses by the Chicago Citizens Committee, and the stadium expenses were underwritten by the committee and the City Council. This gave the arrangements committees only half of the amount they had had to work with in 1940; the Republican chairman, Walter S. Hallanan, explained to reporters that this meant perhaps one-third their 1940 buying power. The opposing parties, incidentally, worked together closely on arrangements, in the interests of economy and efficiency.

At the Democratic convention Pauley was described as aggressively backing the nomination of Senator Harry S. Truman as vice-president on the Roosevelt ticket. *Time* described his "sales talk" (in the May 7, 1945, issue) as: "We're not nominating the Vice-President; we're nominating the next President." Truman, who also had the powerful support of Democratic National Chairman Robert E. Hannegan '44, proved an acceptable compromise candidate, midway between the incumbent Henry A. Wallace '40 and the Southern conservatives' choice, the Presidential assistant Justice James F. Byrnes '41.

After the election, rumor had Pauley in one appointment after another. Columnist Leonard Lyons alone mentioned him, at different times, for Assistant Secretary of the Navy and head of the Reconstruction Finance Commission, and quoted him as saying, "The President knows of my desire to return to private life." After Vice-President Truman succeeded to the Presidency *PM*'s Max Lerner '42 wrote that the appointment of Pauley as Federal Loan administrator was being "powerfully urged" on him.

In April 1945 Edwin Pauley was named to represent the United States on the three-power Allied Reparations Commission to sit in Moscow. President Roosevelt had already appointed a former "braintruster," Isador Lubin '41, to that post, but Truman designated Lubin to assist Pauley, with the rank of Minister. Pauley's appointment was regarded by some as a payment for his labors in the political vineyards—*Time* said flatly, "There had been little to qualify him for the task ahead" —but the *United States News* saw the matter differently. In its view, when Lubin was appointed "the reparations question was considered a matter of statistics and economics. . . .This country's [United States] interest was confined primarily to making certain that Germany is so stripped of productive capacity that she will be unable to go to war for many decades to come. Dr. Lubin, a quiet, capable, and clearheaded statistician and economist, was considered well chosen for the job he was expected to do. But he is no dickerer, no driver of hard bargains. But, as matters have developed, bargaining among the victors is expected to be a principal characteristic of the reparations settlement. Russia wants to strip most of the industrial machinery from German areas to be occupied by the Americans and British, and install it in Soviet factories. America and Britain want food from the usually productive fields of eastern Germany and Poland, occupied or strongly influenced by Russia. A bargain must be struck on that and other points. So President Truman replaced Dr. Lubin with Mr. Pauley, the shrewd, practical oil operator."

Columnist Lowell Mellett also pointed out that Pauley had had successful diplomatic encounters with his future fellow commissioners Salter and Maisky. "Being a member of the Allied Reparations Commission isn't a job that anybody would ask for if he were merely seeking an honor," Mellett pointed out. "It's a job of hard, disagreeable work for which a man is unlikely to receive any recognition, whether he does it well or otherwise. . . .So Ed Pauley has taken the job and had the dubious pleasure of reading that his appointment is a political pay-off by President Truman." Forrest Davis, who wrote that the President had first offered the post to retiring Postmaster General Frank Walker '40, considered that, "actually, Dr. Lubin, while nominally No. 2, was looked upon as the mainstay of the mission, his equipment and background qualifying him for dealing with the essentially economic nature of the day-to-day decisions."

Pauley himself said of his new post, "I am not a soft-peace man. I have no reluctance in making that fact known. Whether we have a hard peace or a soft one is a question for all the United Nations and their governments to decide. What I can promise in my new position is that once the peace is made I shall do everything in my power to prevent it from becoming a brittle peace: that is, one that may be hard in the making but will not hold together under the strain of postwar economics. That is the mistake that was made at the end of the First World War. . . .I make my pledge that it will not happen again." Before leaving for an inspection tour of Germany with Mrs. Pauley and twenty staff members, the reparations commissioner expressed the opinion that the Germans should be permitted "enough light industry to maintain a civilian economy. Otherwise they will be a burden on us."

The American plan presented by Commissioner Pauley called for deindustrializing Germany to the point where she could not make war. War industries which could be moved out of the country were to be taken as reparations in kind. (At the Potsdam Conference, Allied leaders had agreed to divide all reparations on a percentage basis, with about half of the total going to Russia and Poland because of their great loss in life and property.) Immovable war plants were to be destroyed entirely. The Ruhr industrial center was to be broken up, the steel mills and factories being dismantled and distributed to neighboring countries as reparations. Coal from the Ruhr mines was to go to Belgium and France, where new steel centers were planned to utilize the iron ore produced by Sweden, Spain, and France. The whole of Europe was considered as an economic unit, with the inland waterways (the Rhine, the Danube, and various canals) to be under international control. The British and Soviet commissioners agreed to the American plan to make the postwar Germany economically self-sufficient as soon as possible by using the proceeds from German exports to pay for necessary imports, rather than applying the money to payment of past debts or reparations. It was hoped that this plan would enable the United Nations to avoid the mistakes of the period after the First World War, when the demand for reparations produced a need for foreign credit and for the rebuilding of German industries.

Following a Commission meeting in Moscow in August 1945 Pauley disclosed the official American stand on "human reparations." "Compulsory labor service should be required only from those who have been judicially determined to be war criminals, including individuals determined to be members of European Axis organizations, official or unofficial, which themselves have been adjudged criminal organizations," Pauley announced in a statement framed with the help of Associate Justice of the Supreme Court Robert H. Jackson '40, the United States prosecutor for the war criminals trials. The Gestapo, the SS, and possibly the Nazi Party might be so adjudged and their members sentenced to rebuild devastated areas, clear mine fields, and remove tank barriers left after the war. After his return to New York in October 1945, before starting off to Japan (without Dr. Lubin) for similar work, Pauley made several speeches in which he assailed those who attacked the program as "unrealistic." "Can it be," he asked, "that an attempt is being made behind the scenes to preserve vast investments within Germany and to set up anew at the old stand business which proved so profitable to the few and so disastrous to the many?"

In November Pauley flew to Tokyo to make preliminary surveys on material penalties to be imposed on Japan for her war guilt. After a survey of her assets, Pauley said that Japan would be able to pay little to the United States in reparations, much less the "staggering" cost of the occupation. "Our reparations policy will be stern but fair," the Presidential envoy stated. "The final bill will be a bill that we expect to collect. In neither Germany nor Japan are we going to make the mistake that we made after the last war—that of assessing a fantastic sum that is uncollectible." On his return, Pauley recommended to President Truman that part of Emperor Hirohito's personal fortune, estimated at more than one hundred million dollars, be claimed to pay war reparations to the Allies. Pauley further recommended that Japan be stripped of all assets abroad, virtually all chemical, steel, and shipbuilding facilities and half her electric power and machine tool industries. "Only in this way can any possibility of Japan ever waging war again be destroyed, and the countries she victimized be reimbursed," he added.

Inventories of seven of the twenty-three principal Japanese industries, prepared by Allied headquarters for the reparations commission on a twelve-day rush order, indicated that contrary to previous Japanese government reports there was still considerable "fat" on Japan's industrial economy, especially in steel; and she was within 18 per cent of self-sufficiency in food. Pauley was unable to survey Japanese assets in northern Korea and Manchuria, however, as the occupying Russians refused him entry, and in December 1945 he therefore left for Washington, stopping for two days in the Philippines to inspect war damage and confer with Government officials about reparations.

After Pauley's return to Washington, the dollar-a-year man's name was again mentioned for appointment to important posts, mainly that of Secretary of the Navy. The St. Louis *Post-Dispatch* ran a series of articles opposing this possible appointment, because of the Navy's connection wtih oil reserves and Pauley's connection with an oil company. His lobbying for passage of certain bills affecting the oil industry, both before the California legislature and

PAULEY, EDWIN W.—*Continued*

the national Congress, was cited as something legitimate in itself but dangerous in a future Navy Secretary.

Pauley is married to the former Barbara Jean McHenry of California. The couple, whose home is in Beverly Hills, have three sons, Edwin, Jr., Stephen McHenry, and Robert Van Petten, and a daughter named Susan Jean. "Big, bulky, and energetic, a ready talker, a man who attracts people and gets along easily with them," the Californian looks like a man who has gotten where he is the hard way. Despite his untough enthusiasm for economics, which is said to be his favorite reading subject, and for sailing boats of any size, Pauley, who is six feet three inches tall, has impressed at least one observer as "a convincing detective for a Dashiell Hammett movie."

PEMBERTON, BROCK Dec. 14, 1885- Producer; director

Address: b. 244 W. 44th St., New York City; h. 455 E. 51st St., New York City

A dramatic critic who has turned producer, Brock Pemberton during his twenty-five years in the theater has not only contributed more than his quota of good plays, but has helped to bring new talent into the theater. He presented the first plays of Maxwell Anderson '42, Sidney Howard, Paul Osborn, Zona Gale, and gave Preston Sturges '41 his first Broadway success. The list of players he has introduced is equally imposing—Walter Huston, Miriam Hopkins, Claudette Colbert '45, Fredric March '43—and in 1944 he brought vaudeville and night club performer Frank Fay, the star of *Harvey*, to the fore as a top-flight actor.

Brock Pemberton, born in Leavenworth, Kansas, on December 14, 1885, is the son of Albert and Ella (Murdock) Pemberton. The Murdocks were pioneers who traveled from Morgantown, West Virginia, by boat down the Ohio River, finishing their journey in Kansas in a covered wagon. On the Murdock side the family became prominent in Kansas newspaper circles, owning at one time five newspapers in that state. (The present owner of the Wichita *Eagle* is a cousin of Brock Pemberton's; and the late William Allen White '40 once worked on the El Dorado *Republican*, a Murdock paper.) Pemberton's own father, a Kentuckian, established a mercantile shoe business in Leavenworth after learning the business of shoemaking from a Cincinnati bootmaker.

One feature writer has pictured Pemberton's first encounter with the theater at the age of fourteen. On one afternoon, the story goes, the boy carried coal into the basement of the local "opery" house in order to earn a pass to that night's performance. Then he went home, washed off the coal dust, and presented himself and his pass to the ticket-taker. But the Scrooge at the door only looked at him and said, "You never carried any coal in your life," and tore up the pass.

Graduating from the Emporia (Kansas) High School in 1902 Pemberton entered the Student College of Emporia, a Presbyterian school. His stay there was turbulent, for he was much given to playing pranks, and—although on two occasions William Allen White interceded for him—it came to an end in 1905 when the prankster was finally advised to continue his education elsewhere. White, perhaps counting on the steadying influence of work, again offered help and printed a feature story of Pemberton's, "The Floods of Neosho Valley," in the Emporia *Gazette*. This article won Brock the offer of a reportorial job on the Philadelphia *Bulletin*. Later he entered the University of Kansas, where, with the guidance of White, he succeeded in obtaining a B.A. degree in 1908.

Reporting and play reviewing on the Emporia *Gazette* followed. In 1910, however, young Pemberton came East to obtain experience on the metropolitan dailies. His first job (1910-11) was with the New York *Evening Mail*, reporting ship news. The drama desk then became vacant, and the managing editor asked Pemberton to become drama critic. In 1911 he became assistant drama editor to Louis Vincent DeFoe on the New York *World*, where he remained for three years; three more years were spent in a similar position on the New York *Times* during the Alexander Woollcott '41 reign as dramatic critic. Finally in 1917 Pemberton deserted the critics' circle to apprentice himself to producer Arthur Hopkins, who subsequently entered the most distinguished period of his career through his productions starring John Barrymore.

In 1920 Pemberton became an independent producer with *Enter Madame*. The play was an immediate success. Although some of the play reviewers called it "a standardized Broadway play," it won "a sustained chorus of applause" from the rest of the critics. The success of the play actually was fourfold—in road, London, and stock company productions, in addition to the Broadway run.

Miss Lulu Bett introduced novelist Zona Gale to Broadway as the adapter of her own best-selling novel of the same name. Although the play captured the Pulitzer Prize for the season of 1920-21, Pemberton's erstwhile fellow newspaper drama critics were divided in their opinion on the merits of the play. Most of the reviewers on the periodicals were kinder, with the exception of George Jean Nathan, who suggested "there was a booky flavor to the play that will not down." Heywood Broun in *Vanity Fair* thought the play contained the "most amusing dialogue of the season"; and Dorothy Parker commented that Pemberton's production of the popular novel was "truthful, interesting, and amusing." Burns Mantle '44, however, failed to include *Miss Lulu Bett* among his seasonal "ten best plays." (He had included *Enter Madame* in that list).

The most distinguished productions of Pemberton's career are said to be the Italian grotesques by Luigi Pirandello which introduced the playwright to American audiences. The first of these, *Six Characters in Search of an Author* (1922), was called a "document in esthetic theory which makes clear the difficulties under which the artist works in dealing with life, the material of art . . . the reality of created characters, the differences between the realties of art and the realities of life, together with the falsification of both when they are represented through the personalities of actors bound by the conventions and tied to a theory of illusions." As the play opens, on a stage on which a play is about to be rehearsed suddenly step six characters, who explain that they were abandoned by the author who created them, and that they will be wretched if not permitted to finish the tragedy in which they were involved. The director decides to allow them to enact the drama of their lives. The story which these characters unfold was considered so daringly frank when Pirandello's play was performed in Italy that there resulted a storm of protest. The American reviewers, however, were concerned only with its intellectual value. One critic wrote, "Amazing that such deep stuff comes off almost too perfectly"; another declared that Pemberton's "plausible casting and excellent direction partly account for the high level that we get throughout the performance."

The second Pirandello produced by Pemberton, *The Living Mask* (1924), also won the plaudits of the critics, but it failed to achieve the fame of the first production. It has a thematic resemblance to *Harvey*, the play which captured the fancy of theatergoers in 1944-45—"in wackiness lies the greatest wisdom and the truest happiness." *The Living Mask* concerns a man who believed he was Henry IV, Emperor of the Holy Roman Empire. For many years this insane man lived the part of Henry, surrounded by men dressed as attendants to humor him. One day he regains his sanity, but goes on living the masque, simulating his insanity so as not to have to return to the world of reality.

In the past Pemberton has followed his pioneering instinct not only in producing authors' first plays, but in daring to depart from conventional dramatic forms. In 1921 when he presented *Swords*, Sidney Howard's poetic drama, the modern writers' version of that form was more or less new to the Broadway theater. Maxwell Anderson's *White Desert* (1923), written in the rhythmic prose which was later to bring this playwright high praise, is still regarded by Pemberton as a fine play. He believes its failure was due to the fact that it was ahead of its time.

The Ladder, a 1926 production of Pemberton's, does not seem to fit into the Pemberton record of good plays. It made theatrical history because it remained on Broadway for 264 performances, despite an all-time low in critical reviews and in attendance. It has been reported that as many as a thousand passes were given out for a single performance; but after a time even the free seats were not used, and the actors played to empty seats. There were all sorts of explanations for its continuance; the most plausible was the explanation that the backer, Edgar B. Davis, as a believer in reincarnation (the subject of the play), was willing to spend the half a million the play cost him to win converts to his belief.

BROCK PEMBERTON

"Fortunately," says Pemberton, "producers are remembered for their successes, their failures are interred with their bones. More often than not, that's all there is to throw in." Although the producer has had his failures, he has a high average for hits among the thirty or more plays he has produced since 1920. His pet failure, Ransom Rideout's *Goin' Home* (1928), was a Longmans, Green and Company prize play. Despite the unanimous acclaim it received from the reviewers, and the forced three months' run at a cost of forty thousand dollars to Pemberton, the play failed to "click" with the public. (Its subject, miscegenation, belongs on the "Don't Touch" list of producers.)

The failure of *Goin' Home* marked a turning point in Pemberton's career. "My policy," he says, "had been to do a play if I liked it—now I wouldn't do a play unless I was convinced that it would sell to an audience." The following year, 1929, *Strictly Dishonorable,* Preston Sturges' first successful play, became the biggest box office attraction of Pemberton's career. Described by *Outlook* as a "light-as-air comedy of love and adventure, produced and directed with almost flawless taste and artistry," the play ran from September 18, 1929, to January 1, 1931.

A contract gave the owner of the theater where it was housed disposition of the tickets. With the law limiting the number of tickets allotted to brokers and restricting their surcharge to seventy-five cents still in the future, seats for such hits as *Strictly Dishonorable* often brought as much as twenty dollars. "A conservative estimate of the amount paid by the public above box office price to see *Strictly Dishonorable* would be between five hundred thousand and one million dollars," Brock Pem-

PEMBERTON, BROCK—*Continued*

berton has said, adding, "and not a dollar of this reached the producer." Although the ticket code, sponsored by the League of New York Theatres and Actors Equity, and the provisions of the Mitchell Act serve as partial restraints, the racket continued. "Scalpers are happy because they can still get tickets somehow and sell them at a handsome premium for all the smash hits," Burton Rascoe wrote in the *World-Telegram* in 1945. "In spite of all the indignant to-do about their activities, no one, as yet, has found a way to put the finger on them . . . nobody has been jailed yet for tending the harvest while it is good."

The profits from *Strictly Dishonorable* sustained Pemberton through a series of failures. *Three Times the Hour* (1931) ran twenty performances, *Christopher Comes Across* (1932) seven performances, *Personal Appearance* (1934) 501 performances. One critic said that the chorus of hallelujahs which had greeted Pemberton's production of the latter, a farce-comedy, was perhaps overdone, but it was understandable as the play was "hilariously funny." A first play by Lawrence Riley, *Personal Appearance* brought Gladys George stardom through her interpretation of the Hollywood queen who played havoc in a small town when stranded there on a personal appearance tour.

Ceiling Zero of the following year played 135 performances—a moderate success. But Pemberton's three productions in 1937, *Now You've Done It, Chalked Out,* and *Red Harvest,* had runs "as short as a bicycle race." In 1938 *Kiss the Boys Goodbye* by Clare Boothe Luce '42 not only had a successful run, but was listed by Burns Mantle in his seasonal "ten best plays." *Out From Under, Lady in Waiting* (based on Margery Sharp's novel *Nutmeg Tree*), and *Glamour Preferred* were unsuccessful productions of 1940. *Cuckoos on the Hearth* (1941), "a completely mad but quite exciting satire on most of the mystery yarns was considered by some as great, others found it silly. Pemberton nursed the play along for 129 performances before calling it a failure." "A serpent's tooth is a blunt instrument compared to an unsuccessful play," Pemberton wryly observed after one of his productions flopped. *Janie,* opening on September 10, 1942, was still playing to packed houses on Broadway when Pemberton closed it in February 1944 so that it might reap the larger road profits before the motion picture made by the Warners '45 (who had paid one hundred thousand dollars for the rights) was released. His next production, *Pillar to Post* (1943), closed after twenty-seven performances. The concensus of critical opinion was that not only was it a poor play, but that it had been miscast and poorly directed.

Harvey, the producer's 1944 production, is an "essay in whimsy," announced Lucius Beebe '40 and "has restored Brock Pemberton to his accustomed luster as one of the first showmen of Broadway." Not only has the play won enthusiastic reviews from the press, but Park Avenue, according to Beebe, has decreed seeing the play "the thing to do." Critics have distributed "orchids" evenly among the producer, director, author, and Frank Fay, the actor, whom Pemberton "plucked from the night club and radio world to play the most difficult part given out in many a year." Fay plays Elwood P. Dowd, a bachelor given to sociable drinking who has without regrets traded the reality of the world which irked him for the reality of a rabbit (a rabbit over six feet, named Harvey)—to the dismay of his family. Antoinette Perry, who has been associated with the producer since 1928, had the difficult task of directing the play. Mary Coyle Chase '45, the author, is a onetime Denver newspaperwoman. Producer Brock Pemberton, who says "playwrights do not stick to the producer who has given them their first chance," is grateful to Mrs. Chase for giving him the first reading on *Harvey.* He had produced her play *Now You've Done It* in 1937 and, although the play failed, he had encouraged her to continue writing.

"I'd give *Harvey* five years—and up," Pemberton told Ward Morehouse, critic of the New York *Sun,* in April 1945, calling *Harvey* a bigger hit than *Strictly Dishonorable.* With the play grossing nineteen thousand dollars weekly at the end of 1945, its author earning sixteen hundred a week as her share, London and Paris productions in the offing, and translation and production of the play in many other foreign countries being planned, *Harvey* had "hit the bell."

In addition to his work as producer, Pemberton has also in the past assumed that of the director. Known as a patient director, he seldom corrected an actor's reading of a line during rehearsals. One author watching him direct one of her plays said that her first impression was that Pemberton was doing nothing to guide the actors, and to her suggestions on how certain lines should be read, Pemberton would say, "Give them time—it means so much more when they find out a thing for themselves." After the opening night the author concluded that the production of her play had run smoothly because Pemberton was more intent on getting out of every member of the company his creative bit than in remembering that he himself was the director.

Although Pemberton never asks for a credit as a collaborator, he has had a hand in the writing of many of the plays he has produced. Today he says, "I will not accept a play unless the author is willing to make revisions under my direction. In my whole career I have found only one or two plays which did not require changes before they were ready for production." Pemberton is credited with a flair for comedy. With almost as big a reputation for silence as Calvin Coolidge, in writing (he has written many articles for the New York *Times Magazine, Theatre Arts* and other magazines) author Pemberton finds that words seem to flow spontaneously into pungent sentences. A lecture tour he made through the United States during the first three months of 1944 was considered a great success because of his wit and humor on the subject of Broadway. And Pemberton, as an opponent of the New Deal, is said to have supplied Representative Clare Luce with a remark she used effectively in her speeches during the 1944 Presidential campaign.

Pemberton finds his greatest recreation as a football and tennis spectator. He is six feet, weighs one hundred and seventy-six pounds, has blond hair which recently has taken on a platinum sheen, gray-blue eyes, which can be kind and are usually merry. In 1915 he was married to Margaret McCoy of East Orange, New Jersey. The Pembertons live in a spacious apartment overlooking New York's East River. Margaret Pemberton, like her husband, spent her summers since Pearl Harbor at the Stage Door Canteen and the Merchant Seamen's Club. Pemberton is a member of the board of directors of the American Theatre Wing War Service, organizing and laying the groundwork for canteens all over the country. Pemberton spent ten weeks in the summer of 1944 (at his own expense and without salary) in establishing a canteen in San Francisco. He was one of the organizers of the USO-Camp Shows and of the Merchant Seamen's Club and he holds executive posts in the New York Theatre League, the Stage Relief Fund, and the American Theatre Council. Mrs. Pemberton has done the costuming of all her husband's productions and at one time was head of a department for theatrical costuming at Saks Fifth Avenue in New York City.

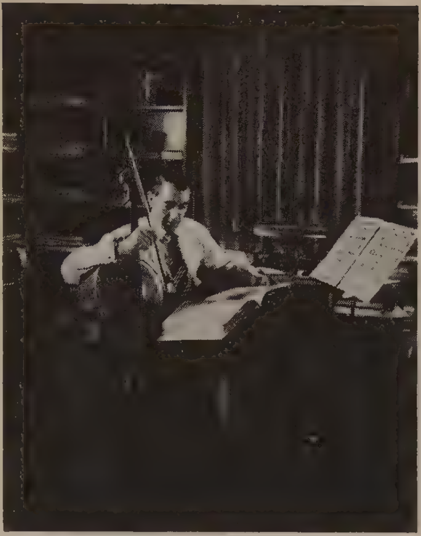
PIATIGORSKY, GREGOR (pyä″tĭ-gôr′skĭ grĕg′ẽr) Apr. 17, 1903- Cellist

Address: b. c/o Columbia Concerts, Inc., 113 W. 57th St., New York City; h. 1830 S. Rittenhouse Sq., Philadelphia, Pa.

Internationally recognized as a leading cello virtuoso, Gregor Piatigorsky is, in the opinion of Serge Koussevitzky[’40], "the greatest cellist of our day." After a brilliant youthful career in Europe, the musician came to the United States in 1929 and has become well known to the American concert-goer. Piatigorsky has played more concerts in the United States and Canada than any other cellist, appearing with the principal symphony orchestras and conductors, and he has done considerable recording. Author of several compositions himself, he has added much to the repertoire of the cello through transcriptions of classical and modern works.

The Ukrainian town of Ekaterinoslav is the birthplace of Gregor Piatigorsky. He was born there on April 17, 1903, to Paul I. and Maria (Amchislawsky) Piatigorsky. Paul Piatigorsky was a violinist and began teaching his son when the boy was six years old. To contribute to the struggling family's support, "Grisha" went to work at the age of nine, playing the cello in the local motion picture theater. He attended school during the day, worked at night, and practiced whenever there was time. He advanced so rapidly that by the age of fifteen he was launched on a promising career: he became first cellist of the Imperial Opera Orchestra in Moscow. At this time he also played in the string quartet at the Conservatory while studying under Alfred von Glehn. Meanwhile, the Revolution had begun, and the musician tried to leave the country. He finally entered Poland in 1921 after a series of mishaps. There followed a period of hunger and suffering for the refugee which ended with his appointment to the Warsaw Opera Orchestra. After about a year, however, he decided to go on to Berlin, where for a time he again met bad luck and was forced to support himself by playing in cafes and theaters. In Berlin he continued his studies with Julius Klengel, who considered him already a master.



GREGOR PIATIGORSKY

At about this time Artur Schnabel[’42] heard Piatigorsky play, and that, in the opinion of David Ewen in *Living Musicians*, proved to be the turning point in the cellist's career. According to Ewen, Schnabel invited Piatigorsky to perform a work by Arnold Schoenberg[’42], and at this performance another musician introduced the cellist to the important German conductor, Wilhelm Furtwängler. The latter urged Piatigorsky to compete for the position of first cellist in the Berlin Philharmonic, and in 1923 the Russian won the appointment. Thereafter, his rise was swift; Furtwängler had him play many concertos, and European engagements mounted. In 1926 Piatigorsky became a professor at the Scherwenka Conservatory of Music in the German capital. Two years later he resigned from the Berlin Philharmonic to devote himself to solo appearances. "However," writes Ewen, "as a sign of gratitude to the conductor who discovered him, Piatigorsky always returned to his first desk in the Berlin Philharmonic whenever Furtwängler conducted."

(Continued next page)

PIATIGORSKY, GREGOR—*Continued*

The cellist now toured Europe as soloist with the leading orchestras and also with chamber music groups—for a period he was a member of a trio with Schnabel and the violinist, Karl Flesch. Then, in 1929 he came to the United States, making his American debut in Oberlin, Ohio, on November 5, 1929. The next month he gave his first New York performance, with the Philharmonic under Mengelberg, playing the Dvŏrák concerto. Of this performance Samuel Chotzinoff '40 wrote: "In his hands the instrument shed its reputed limitations. The lower register yielded beautiful sounds, as did the higher. . . .He is one of the most poetic and sensitive performers now before the public." Since then the musician has made several American tours, sometimes playing for audiences who had never before heard a solo cellist. A writer in *Newsweek* once declared: "His playing has brought about a cello renaissance."

During a tour of the British Isles in 1934 Piatigorsky chanced to meet in London an American patron of the arts, Ernest B. Dane, then president of the trustees of the Boston Symphony, and to him the Russian complained, "My cello is sick." Before he returned home, Dane had presented the musician with a rare and beautiful Montagnana, made in 1739 and valued at thirty thousand dollars. Piatigorsky allows no one to play this cello, feeling strongly about the rapport between the artist and his instrument. He first played it for an American audience in January 1935, when, with the Philharmonic under Toscanini '42, he introduced a cello concerto composed for him by Castelnuovo-Tedesco. This concert grew out of a shipboard friendship between the cellist and the conductor, a former cellist, when both were traveling to Italy in the spring of the previous year. Other composers who have dedicated cello concertos to Piatigorsky are Prokofiev '41, Stan Golestan, and Paul Hindemith '41.

In a concert at Carnegie Hall in March 1940 with the Boston Symphony under Koussevitzky, the cellist played a new Prokofiev concerto for cello, and Richard Strauss's '44 tone poem, *Don Quixote*. In his review in the New York *Sun*, Irving Kolodin pronounced the cellist in "top form" but added parenthetically, "save for an odd disposition to play out of tune every so often." In the Strauss work, this critic went on to say, Piatigorsky "gave himself over wholly to the unpredictableness of the creature's nature." That summer the musician again played *Don Quixote* under Koussevitzky's baton, this time at the Berkshire Symphonic Festival. When he recorded this work late in 1942 with Fritz Reiner '41 and the Pittsburgh Symphony, the critics were unanimous in their approval. In the New York *Times*, Howard Taubman wrote: "He contributes a beautiful job," while in *Etude*, Peter Hugh Reed pronounced it better than Emanuel Feuermann's rendition of the work, "more expressive and more poetically sensitive." After a New York benefit recital in October 1943 a New York *World-Telegram* writer reported: "Gregor Piatigorsky turned poet and seer at the cello," and the *Times* critic called it "an exhibition of cello playing at the peak of perfection." When in November of the following year he played Haydn's D Major Cello Concerto, Oscar Thompson found "its plentiful technical skill blemished by some poor intonation on higher notes—particularly in the first movement." After his concert with the Philadelphia Orchestra under Eugene Ormandy '41 in February 1945, several critics commented on the sentimentality of his reading of the Schumann cello concerto; while the critic for *Musical America* wrote praisingly of the artist: "Mr. Piatigorsky, at the top of his magnificent form, played the solo with a plangent, voluminous tone, faultless taste, and a depth of intimate feeling untouched by the slightest trace of shallow virtuosity. The great cellist has done nothing finer in this city."

Piatigorsky's concerts have taken him on world-wide tours and he has taught in several conservatories. In June 1942 he joined the faculty of Philadelphia's Curtis Institute of Music as head of the violoncello department, but resigned that position two years later to devote himself to concert work. He has also been the head of the chamber music department at the Berkshire Symphonic Festivals. In February 1944 the cellist temporarily left his instrument for the podium, to conduct the Denver Symphony Orchestra. His radio work includes performances with the Philharmonic under John Barbirolli '40 over CBS, with the NBC Symphony, and as guest artist on the *Telephone Hour*.

On the subject of modern music—he plays both modern and classical works—Piatigorsky has commented that "contemporary music is not necessarily modern. It may be classic, romantic, anything at all. It may be melodic or it may be atonal." In his opinion, "Beethoven's last quartets are as modern as anything ever written, in that they are new. They will always be new for they say that which was never said before and never will be repeated." "The cellist's choice of selections is small," Piatigorsky has declared. As a director of the Koussevitzky Music Foundation, he stressed the need for such compositions, and in 1945 special grants were awarded to encourage composers. Interested, also, in promoting American music, Piatigorsky is one of the sponsors of the American Youth Orchestra and has established a scholarship fund for American composers at the University of Chicago. The Russian-born musician, who became an American citizen in 1942, believes that his native and adopted lands have much in common. "There is a vastness of territory, a variety of climates, a mixed population in these countries that shows itself in the personality of their people," he says. "No two countries in the world reflect the breadth of the masses as Russia and the United States."

Once chosen by sculptress Katharine Ward Lane as one of the ten handsomest men in the United States, the brown-haired, dark-eyed cellist was described as "marvelously proportioned, though massive"—he is over six feet tall and weighs one hundred and eighty-five pounds. He has been a frequent subject for artists, and in 1943 his portrait, painted by Wayman Adams, won first prize in the annual Carnegie Institute Exhibition in Pittsburgh. His hobby is writing poetry—in Russian—and he enjoys bridge, chess, boating, and swimming. An honorary member of many musical institutions and clubs, Piatigorsky holds a citation from the United States Treasury Department and honorary life membership in the Pension

Fund of the Philadelphia Orchestra. He was married to Jacqueline de Rothschild, daughter of Baron Edouard de Rothschild of Paris, on January 26, 1937, and the couple have two children, Jeptha Maria and Joram Paul. Mrs. Piatigorsky, who is said to be a good amateur musician, plays the piano and bassoon. A number of stories are told of Piatigorsky's sense of humor. When Columbia Concerts advised its artists to travel light because of wartime restrictions the cellist wrote to his manager that he was changing to the piccolo.

PICKETT, CLARENCE E(VAN) Oct. 19, 1884- Social service leader

Address: b. c/o American Friends Service Committee, 20 S. 12th St., Philadelphia; h. Wallingford, Pa.

Representing the Society of Friends in the international social service field, the American Friends Service Committee is a widely known organization whose projects encompass whatever activities can help human beings in distress. The executive secretary of this committee since 1929 has been Clarence E. Pickett, a former minister and teacher of biblical literature. A director of the United States Committee for the Care of European Children and president of the American Council on Race Relations, he has done constructive Quaker service in relief and rehabilitation work in America, as well as directing the European relief work of the Service Committee.

The youngest of the eight children of Evan and Huldah (Macy) Pickett, Clarence Evan Pickett was born on October 19, 1884, on an Illinois farm in Cissna Park, eighty miles south of Chicago. When he was two years old his parents moved to Kansas, where Clarence was brought up on a prairie farm "in a Quaker colony in the middle of nowhere," to use his words. He received his early education in the local district school and village high school. After teaching for a year in the local community school he "pulled up stakes" and went to Penn College at Oskaloosa, Iowa, from which he was graduated with a B.A. degree in 1910. "On the campus," one writer observes, "he was untraditional, the liberal, the social action leader, proving his unenterprising nature by going to Europe directly after college."

After college Pickett's choice of a career seemed to be limited to farming, teaching, or the ministry. Despite his background, however, Pickett never wanted to be a farmer, and though he was not "overwhelmingly convinced" that he should be a minister, he entered Hartford Theological Seminary in Connecticut. He studied there from 1910 to 1913, receiving the B.D. degree. During this period of theological study he spent one summer traveling and studying in Europe and another summer as a social worker at the Spring Street Neighborhood House in New York City. In 1913 he was married to Lilly Peckham of Oskaloosa, the marriage being the culmination of a courtship begun in college.

CLARENCE E. PICKETT

The year of his marriage young Pickett became the minister of the Friends Church in Toronto, Canada. He remained there until 1917, when he went back to Oskaloosa to become leader of the College Church, a position which he held for two years. From September 1919 to September 1922 he was secretary of Young Friends in America, with one period of a few months' study in Europe as a part of this service. This work dealt particularly with the development of personnel study and placement work in colleges and universities. Then for a year he studied at Harvard University's Divinity School, afterward going to Earlham College at Richmond, Indiana, in 1923 to be professor of biblical literature. This position, which he held until 1929, involved teaching religion and conducting courses and experiments in the application of ethical principles to social problems. In 1929 he accepted his present post of executive secretary of the American Friends Service Committee, in Philadelphia.

From the time of the founding of their sect in England in the seventeenth century, the Society of Friends, or Quakers, have believed that their religious faith must go hand in hand with action. Quaker service, they feel, must go further than charitable relief; it tries to strike at the core of social ills. Thus, it "engages in war relief or aids the victims of industrial dislocation, rather than being drawn to relieve natural disasters which present no problems of human conflict and in which other agencies can operate effectively." The American Friends Service Committee, an incorporated body under the laws of the State of Pennsylvania, was formed in 1917 by Friends who wanted to make "a constructive and nonmilitary contribution to the world." Under the leadership of Rufus Jones '41 (who in 1945 at eighty-two still headed the Committee), this active organization of "wearers of the red and black star" received world-wide recognition for their

PICKETT, CLARENCE E.—*Continued*

relief work in Europe during the First World War, and later for their humane enterprises in almost all quarters of the globe.

In a foreword to *Quakers Take Stock*, a book compiled by Anna L. Curtis in 1944 giving accounts of recent developments in Friends' relief and refugee work, Clarence Pickett compares the American Friends Service Committee to "a river that is forever old and forever new." "Its projects change," he writes, "but its purpose remains the same. Sometimes the emphasis is on relief work overseas for suffering victims of war or persecution. At other times grave problems in our own country, such as industrial unrest and racial antagonisms, claim our chief attention, but always the Service Committee is seeking to create the kind of a world that should grow out of a Christian faith—a world in which men, women, and children can live in peace, security, and self-respect, and in friendly accord with one another regardless of racial, religious, or political differences."

Since becoming secretary of the Committee, which has a staff of two hundred, Clarence Pickett has been in charge of the European work of the Committee, spending several periods abroad studying conditions. At the end of the First World War, however, he concentrated his activities to some extent on relief and rehabilitation work in America. As early as 1922 the Service Committee had started to feed the children of unemployed miners in the bituminous coal fields. As the distress of these people deepened, this relief work grew to major proportions. Aggravated by the depression, by 1931 the need for immediate relief had spread to the coal fields of many states. With funds largely furnished by the American Relief Administration Children's Fund, the Friends fed a maximum of forty thousand children daily in schoolhouses throughout the coal fields of Pennsylvania, West Virginia, Kentucky, Maryland, Illinois, Ohio, and Tennessee.

As an outgrowth of this emergency feeding, several experiments were made to find a solution to large-scale unemployment and to develop new skills for displaced workers. Miners have been trained in carpentry, handicrafts, and subsistence farming, and several communities and factories have been organized. From 1933 to 1935 Pickett served part-time in the Division of Subsistence Homesteads, under the Department of the Interior, working with the problem of stranded mining and industrial populations. In 1935-36 he served part-time as a consultant in the Resettlement Administration in Washington, D.C., and then as a consultant in the Farm Security Administration (later the National Housing Agency).

According to the Boston *Transcript*, in 1940, when the United States had no ambassador in Berlin, Clarence Pickett was considered as a possibility for the post. Eleanor Roosevelt '40 and Myron C. Taylor '40 (he was then peace negotiator at the Vatican), both friends of Pickett's, were said to have favored his appointment because the United States would thus have an envoy who would be in touch with the German people. Since Pickett had for several years maintained Friends Centers in Berlin and Vienna, he seemed a logical choice. However, the United States did not send an envoy at that time, and Alexander Kirk '45, who as Chargé d'Affaires had been the only representative of the United States in Germany during the opening years of the Second World War, was recalled in October 1940.

In 1942 in New York, at the yearly meeting of the Society of Friends, Pickett declared that in his opinion relief for people in distress throughout the world should be placed on a basis similar to Lend-Lease war aid, pointing out that "relief in reconstruction is beyond the capacity of a private organization. If the United States could build a structure whereby the relief needs of the peoples of the world could be supplied," he said, "fundamental thinking might be directed toward a combination of practical economics and spiritual expression."

In July 1944 Clarence Pickett, writing in the *Annals of the American Academy*, described conditions in occupied Europe as "grim" and "deteriorating." In Poland and Greece people had died of starvation, he said; in Belgium, Yugoslavia, France, the Netherlands, and Norway there had been few such deaths, but the mortality rate had increased because of general susceptibility to disease, and there was widespread distress, particularly among the middle classes and the poor who could not afford the high prices of the black market. The American Friends Service Committee would continue to ask the United States Government to permit relief supplies to be sent through the Allied blockade to Europe, he said, because in no other way could the Allied people be kept from starvation, and the way be prepared for the full functioning of the United Nations Relief and Rehabilitation Administration. "We have not suffered as have the people of Europe," he wrote, "and our desire to be helpful will not be enough. They will see in us a people who are well-fed, well-clothed, insulated in a security which they have long ago lost or discarded. They will resent us or turn away unless we can give them understanding instead of moral judgments, unless, sharing their pain, we can find spiritual strength for a ministry of humility and dedication."

At the end of the year Pickett went to England and France on the invitation of the Committee on Anglo-American Collaboration of the Meeting for Sufferings. He discussed with the Meeting for Sufferings, the Friends Service Council, the Friends ambulance units, and other groups how American and English Friends could join forces in relief enterprises and "efforts to carry the message of peace to a world which has largely lost faith." Mrs. Roosevelt, who talked to Pickett on his return from France, was greatly moved by his report of conditions and wrote of it in her daily newspaper column. Later the secretary told interviewers that the Friends were caring for two thousand Spanish children in the south of France, though the French were beginning to adopt some of them.

In his report of the year's activties, presented to the meeting of the American Friends Service Committee in January 1945, the secretary reviewed the accomplishments of the Committee in the fields of peace education, work camps, foreign service, interracial fellowship, and civilian public service. Quaker forums for adults and college students discussed the Dumbarton Oaks proposals and permanent compulsory military training. Work camps for young volunteers handled projects varying from aid to village clinics in Mexico to the repair of Kentucky mountain schoolhouses. The foreign service organized visits to French prison camps, operated ambulance units in China and India, assisted refugees in Portugal, Spain, Switzerland, Italy, North Africa, and the Middle East (in some sections working under UNRRA), and sent tons of clothing, food, medicine, and household articles abroad.

At the close of 1944, according to the Pickett report, there were 1,733 men enrolled in Friends Civilian Public Service, a department organized in 1941. (Conscientious objectors are enrolled in this branch.) Some of these men are on assignment to work camps, others care for the mentally ill in state hospitals or for children in state training schools. Other activities include agricultural experiments, public health, and medical research.

Quakers have always been opposed to violence or coercion, even though the end of certain actions appears admirable. In 1944 Clarence Pickett was one of twenty-eight clergymen and other leaders who signed a much-criticized appeal against "obliteration bombings" of German cities. This appeal was published as a foreword to "Massacre by Bombing," an article by Vera Brittain published in the March issue of *Fellowship*, the monthly organ of the Fellowship of Reconciliation, a pacifist organization. Though in general there is great respect for the Quakers' point of view and admiration for their practical and valuable work, there is also criticism of their pacifism. The Dumbarton Oaks proposals have been approved by the Friends Service Committee in general although they were considered inadequate. Some Friends supported the war as individuals, but all Quaker bodies reaffirmed their pacifism. However, it was pointed out that the Quaker peace testimony was more difficult to maintain in the Second World War than in preceding wars because of the variance with Quaker beliefs of Hitler '42 standards and because of the inescapable involvement of civilians in the war.

Alarmed at the increasingly critical food situation in Central Europe, Pickett asked that foodstuffs be carried to the starving children of that area and that the Allied Control Council policy which prevents American voluntary relief agency operation in Germany and Austria be changed at once if famine and wholesale death were to be averted during the winter. He pointed out that the American Friends Service Committee was well aware of the fact that reeducation of the children was as necessary as actual food was to them, but, he continued, "you cannot educate children who are starving."

The Service Committee secretary is a director of the National Planning Association, National Refugee Service, Celo Community, Inc., of North Carolina, Field Foundation, Inc., New School for Social Research, and United China Relief. Although it is not connected with the American Friends Service Committee, the American Council on Race Relations, which was formed in 1944 and of which Clarence Pickett is president, shares a main common interest with the Friends—the field of race relations in the United States. As one writer has said, "helping minorities in trouble is an old, established habit of Mr. Pickett's." The Council concerns itself with all sorts of minority tensions, the president has pointed out, not only the problems of Negroes, but those of Mexican-Americans, Japanese-Americans, and other minorities as well.

Mr. and Mrs. Pickett live in Wallingford, Pennsylvania, in a house "surrounded by an acre of flowers and vegetables," according to a New York *Post* interviewer. The work of the "genial, wiry" secretary necessitates a great deal of traveling, but when he is at home he enjoys gardening, an occasional game of golf, or walking with his two cocker spaniels. He collects walking sticks but seldom carries one. The Picketts have two daughters and a granddaughter. Pickett considers himself a Kansan, pointing out that he cannot call himself a Philadelphian since he has lived there "only sixteen years—not two hundred and fifty."

PICKFORD, MARY Apr. 8, 1893- Actress; producer

Address: h. Pickfair, Beverly Hills, Calif.

Today Mary Pickford, whose motion picture career was the talk of the world, heads her own producing company and wears the title of "America's Sweetheart, Emeritus." Her golden curls have given way to a modish coiffeur, but she still looks many years younger than her age. As "Queen of the Movies"—both on the screen and in Hollywood society—she has reigned a long time, for no one has seemed to take her place, although many were groomed for it. A child actress before the age of six, Mary Pickford reached phenomenal success, acquiring millions and winning international fame. A capable business woman, she is also admired for her quiet charm and sincerity.

Mary Pickford was born April 8, 1893, in Toronto, Canada. Her name then was Gladys Mary Smith, becoming Gladys Pickford when she was about nine years old, and Mary Pickford a few years later. Her father, John Smith, died when she was four. Her Irish Canadian mother, Charlotte Smith, struggling to make ends meet, did sewing and played small parts in stock companies to provide for her three small children. In 1898, when Mrs. Smith was with the Valentine Stock Company of Toronto, the company decided to produce a whimsical play entitled *Bootle's Baby*. One day Mrs. Smith brought Gladys, her eldest child, to a rehearsal. The manager had been searching for a child to play the baby role but had been unsuccessful. That day he was bewailing his predicament when, to his amazement, five-year-old Gladys solemnly volunteered to play the part. She played it so well that she was given other child roles in the same company.

(Continued next page)

MARY PICKFORD

The roles which little Gladys Smith played in the Valentine Stock Company in the course of the next year or so were simple parts. Nevertheless, she came to all the rehearsals, for her mother was playing regularly. Her thin shoulders wrapped in a shawl, she moved about the drafty stage, watching the world of make-believe come to life, quietly absorbing the atmosphere of the theater, playing with the ubiquitous backstage kittens. When Gladys was nearly seven, a wealthy doctor and his wife offered to adopt her. Upon the insistence of her aunt that she be allowed to decide for herself, Gladys chose to remain with her mother. Miss Pickford has said she never regretted it, although it meant years of struggle for her at an age when most children are not compelled to work.

After another year Mrs. Smith was offered a part in a road production of *The Little Red Schoolhouse.* There were parts for Gladys and sister Lottie, too, so the family left Toronto to go on tour. In 1902 they became members of a company which presented *The Fatal Wedding*, in which Gladys played the role of Jessie. She attracted attention even at this early age by the "utter naturalness" of her acting. Other melodramas followed in which Gladys appeared: as Eva in *Uncle Tom's Cabin* and as Willie Carlyle in *East Lynne.* Chauncey Olcott then engaged the family as members of his company. It was while touring with Olcott in *Edmund Burke*, in 1906, that Mrs. Smith decided to take a new stage name for her family. That name was Pickford, after the children's paternal grandmother. As Pickford, then, the whole family acted in *Edmund Burke*, for brother Jack had now joined the trouping family. After the Olcott engagement Gladys Pickford was the child in many more blood-and-thunder melodramas. For several years the family kept together, playing in small road companies which made one-night stands. Gladys was the official packer for the family and, when not acting, she mothered the two younger children. At one time their mother was understudy for all the women in the cast, Lottie understudied Gladys, and Jack played a minor part—all for the combined salary of twenty dollars a week and railroad fare.

During all this period of gypsying on the road, Gladys kept her eyes and ears wide open, absorbing the "tremendous trifles" of the actor's art so essential to stage success. She learned what to do with her hands and feet, how to control the muscles of her face, how to look grave and gay by turn, how to interpret ideas and emotions to the audience through pantomime. Her face began to assume the look of "sweet and questioning seriousness" that was one of her chief charms. This and the dimpling smile made her a favorite with audiences everywhere.

Gladys was now earning most of the money the family received and, always a serious child, she felt the responsibility of being the chief breadwinner. Finally, after tours through the Middle West and South, the bright-haired, sunny-tempered little actress, now about thirteen, reached a New Jersey town across the Hudson from Manhattan. Intent upon becoming a star on Broadway, according to one tale, she took a ferry across the river one morning and presented herself at the stage door of the Belasco Theatre, where the first rehearsal of *The Warrens of Virginia* was being held. When she asked to see the producer Belasco, the doorkeeper told her it was impossible. She insisted, and the doorkeeper, charmed by the intensity of the slight girl with the golden curls, took the request to Belasco. The rehearsal was not going too well—the child part of Betty Warren was not well cast and Belasco had no time to interview an unknown. The doorkeeper broke the news as gently as possible to her and she gave vent to one of the outbursts of temper which became famous because of their rare occurrence. She rushed through the door to the stage. Breathless and flushed with indignation, she confronted Belasco with an irresistible smile. "Oh," she exclaimed delightedly, "I know you from your picture." The situation intrigued Belasco. Amused by her naïveté and impressed by her sincerity, he gave her a tryout. After that, rehearsals went smoothly, for Mary Pickford was playing the part of the child well enough to please the famous producer.

Thus, the fourteen-year-old Miss Pickford made her first appearance in New York at the Belasco Theatre on December 3, 1907 as Betty in *The Warrens of Virginia.* Belasco later said it was a pleasure to direct her. "She was a hard worker, always first at rehearsals and last to go. . . .On the first night she was the most composed of the entire company. . . .From the first she gave promise of the ability that made her the greatest motion picture artist in the world." Mary spent two seasons with Belasco in New York and on tour. They were invaluable years to her, although both her part and salary were small. By the time she returned to New York, at the close of the second season, however, she had saved $250. Most of it went for clothes and to help her mother. It was summer now and the regular theaters were closed, but Mary had to work, so she decided to try the movies.

The old Biograph Motion Picture Company had its studios on Fourteenth Street at that time. The young actress was taken on as an "extra" at once. That night she was paid for her work and told to return the next day. She continued as an "extra" for several weeks, playing short, unimportant parts. She was always on time, obedient, quiet, and unobtrusive. Her first screen appearance was in *Her First Biscuits* with Florence Lawrence and William Courtwright, who again appeared with her in *My Best Girl* in 1927 when she was famous. Her first leading role was in *The Violin Maker of Cremona*, directed by D. W. Griffith. Then she went to Independent Motion Picture Company for a while, and then returned to Biograph. At first she was known as "The Biograph Girl with the Curls." The names of players were not announced in those days; advertisements gave the titles and short synopses of the pictures but no mention whatsoever of the actors. Then the public learned her first name and she became "Our Mary" and "Little Mary." In the course of time, she was cast for leading roles opposite a good-looking young leading man named Owen Moore. The unusual occurrence of a large company of film players being sent to Havana and the news of the secret marriage of Miss Pickford and Owen Moore brought her name into the newspapers. For the first time hundreds of thousands who had seen her knew who she was.

When Mary Pickford's star began to rise, she was under contract to Zukor who had founded The Famous Players Film Company in 1912. Her first real hit was to be *Hearts Adrift* in 1914. Between her and Adolph Zukor there has existed a working friendship of long standing. His pictures made her famous; her popularity brought him more and more money. They were just enough alike to understand, just different enough to admire each other, as one feature magazine article put it. Zukor recognized and admired her intelligence and shrewdness. "I always liked his ideas," says the star. "She taught me a great deal," says Zukor. When other firms began paying lesser stars more than she was getting, she told Zukor. "All right, let's be happy," said he and made it one thousand dollars a week.

In January 1913 Miss Pickford returned to Belasco to be starred as Juliet in *A Good Little Devil.* When she had left the theater to go into movies, she had promised to return if he ever needed her. Her success in the difficult role of the little blind girl was phenomenal. Belasco himself said that nothing like her remarkable performance in the child's part had ever been seen in New York or elsewhere. As a result, she was sought eagerly by moving picture managers for their companies. In the spring of 1913 she made a film of the play for Famous Players and after that rose rapidly to her subsequent eminence in pictures. Zukor advanced her salary to $2,000 a week and then in 1916 to $4,000, an unprecedented salary for that time.

In the summer of 1916 her contract with Famous Players expired. The whole motion picture industry knew it and the larger companies prepared for spirited bidding. At that moment Miss Pickford outshone all other stars, for the rise of Chaplin '40 came later. Any firm could afford to lose money on her for the prestige she would give its other productions. She was working in Hollywood at the time, but she arranged to come to New York between pictures. Offers from other firms began to come even before she left Hollywood. She saw Zukor and told him frankly she was worth more money. He agreed with her but he made no offer, and she promised to see him before she signed with anyone else. The first to raise the bidding was an agent of the American Tobacco Company—he offered $7,000 a week. Vitagraph raised that. Mutual laid before her a contract which meant virtually a million a year. There the bidding stopped. Miss Pickford had kept Zukor informed as to the status of the negotiations; and when she faced him, he said, "I'm going to give you half of the profits of your films and a voice in the selection of them. And a guaranty of $10,000 a week. And, Mary, that's my limit. Others may offer you more. But it is as much as I can afford." She knew he meant it. After a little discussion of details, she signed the contract, much to the wonder of the motion picture business. "I like to work with him," Miss Pickford explained. "We have the same ideas. We've been down in the world and up in the world together and I'm sure of him. And $10,000 a week is enough. Besides, he's established. I don't have to worry about getting my money."

After signing with Zukor, Mary Pickford returned to Hollywood while he remained in New York, absorbed in business. The lot at Hollywood had grown into a veritable factory; the management became complex and impersonal. The intimate touch of the old days when they thrashed out scenarios in Frohman's apartment were gone forever. Aware of all this, the newly organized First National approached Miss Pickford with an offer as her Zukor contract was about to expire—an offer of a share of the profits, certain powers of decision, and a guaranty of $250,000 for each picture. After another talk with Zukor, Miss Pickford chose not to sign with him. Thus ended a five-year association during which the young actress had risen from a "nobody" in a new medium of entertainment to the world-famous "America's Sweetheart." In 1918 she became an independent producer, making pictures for release through First National. Early in 1919 Miss Pickford became one of the organizers of United Artists Corporation, which releases her productions today. Among Mary Pickford's best known silent films were *Hearts Adrift* (1914), *Tess of the Storm Country*, first produced in 1914, with a second version in 1922, *Stella Maris* (1918), *Daddy Long Legs* (1919), *Pollyanna* (1920), *Rebecca of Sunnybrook Farm* (1917), *Poor Little Rich Girl* (1917), *Little Lord Fauntleroy* (1921).

Though successful in her career, Miss Pickford had not found happiness in her marriage. She obtained a divorce from Owen Moore and in March, 1920, married Douglas Fairbanks '40, the popular film star. "Mary and Doug" were both at the height of their popularity, and their marriage was considered an ideal love match. They had a quiet wedding and came East on business. While in New York, they decided to give themselves a six-week vacation in Europe. The honeymoon, as Alexander Woollcott described it, was the most conspicuous in the history of the marriage institution. They were mobbed by people, wined and dined by the aristocracy and artists in England and on the Continent. Everywhere they went they caused

PICKFORD, MARY—*Continued*

a near-riot. The police had to protect them from over-enthusiastic admirers. The press discussed it all at great length, in serious and satiric vein. The recipients of all this acclaim were the least surprised of all, for letters had been pouring in to them for years from all over the globe—Miss Pickford's mail had often reached ten thousand letters a week.

Returning to America, the couple resumed their respective roles of king and queen of motion pictures and of Hollywood society. They bought Pickfair, a luxurious showplace in Beverly Hills to which invitations were sought avidly by all Hollywoodites and visitors from all corners of the world. Fairbanks bore the household expenses, and Mary Pickford took care of her mother's home. Together they shared the studio expenses. In 1928 her mother died, a loss the actress felt deeply. They had been very devoted all their lives, and Mrs. Pickford had been her daughter's business manager for a large part of her career.

Mary Pickford brought Ernst Lubitsch to America to direct her in *Rosita* in 1923, thus introducing the now famous "Lubitsch touch" to Hollywood. In 1927 she was one of the sponsors, with Cecil B. de Mille '42, Irving Thalberg, Jesse Lasky, Douglas Fairbanks, and others, of the Motion Picture Academy of Arts and Sciences, a nonprofit organization which has become famous for its annual award of "Oscars" for excellence of acting, production, and scenario.

It was early in 1929 that Miss Pickford cut off her curls and "faced the facts of life on the screen." She made her first talking picture—*Coquette.* Some time later, she and Fairbanks made their first appearance together in an all-talking version of *The Taming of the Shrew.* In 1932 she appeared in *Kiki* for United Artists. The year 1934 saw her debut as a writer. *Why Not Try God* was published that year, *My Rendezvous with Life* appeared in 1935; both of these books set forth her philosophy of life. Miss Pickford is also the author of a novel, *The Demi-Widow* (1935).

Miss Pickford and Douglas Fairbanks were divorced early in 1935 after a separation and repeated rumors of reconciliation. With the passing of years her interest in picture production increased. In 1935 she became first vice-president of United Artists, producing *One Rainy Afternoon* (1936) and *Gay Desperado* (1936). She also appeared in a series of radio sketches over CBS, and in 1937 she formed the Mary Pickford Cosmetic Company.

Miss Pickford continues to be part-owner, with David O. Selznick and Charles Chaplin, of United Artists. Late in 1944 she set up an independent production company after signing up Sam Coslow to participate on a percentage basis. Three productions were on the 1946 schedule—*There Goes Lona Henry,* to be released through United Artists; *One Touch of Venus,* a three-million-dollar production; and *Champagne for Everybody,* starring the Mexican screen actor Armen Daris, formerly known as Pedro Armendariz. In November 1945 Mary Pickford announced the formation of a new production unit to make six moderate budget pictures during 1946 for United Artists. Most of the films will be limited to sixty minutes running time. Miss Pickford will be president of the new company, her husband, Charles Rogers, vice-president and treasurer, and Edward J. Peskay executive vice-president.

In December 1943 and again in 1944 Miss Pickford was appointed head of the women's division of the National Foundation for Infantile Paralysis. Pickfair, her home, was still serving in 1945 as a de luxe branch of the USO, with weekly swimming parties and other entertainment for servicemen. Pickfair was on the "must" list of GI's from all over the world. Charles ("Buddy") Rogers, to whom Miss Pickford was married in 1937, served during the war as a lieutenant commander in the Navy. They have two adopted children, Ronnie and Roxanne.

PIPPIN, HORACE Feb. 22, 1888- Artist
Address: b. c/o Robert Carlen Gallery, 323 S. 16th St., Philadelphia

"The most important Negro painter to appear in America," is Albert C. Barnes's '45 evaluation of Horace Pippin, primitivist painter whose artistic rise has been swift and sudden. Since he was "discovered" in 1937, Pippin has had one-man exhibitions in leading art galleries, and his paintings are now part of the permanent collections of the Nation's art museums and private collections. Hailed as "one of the rare figures in contemporary American art," he is completely self-taught, having had neither artistic training nor contact with the work of other artists. The painter has hurdled the obstacles of poverty, the strain of heavy labor, physical disability, and racial handicap to attain his present position of distinction in American art.

The son of Negro laborers, Horace Pippin was born on Washington's Birthday, 1888, in West Chester, Pennsylvania. When the boy was very young the family moved to Goshen, New York, and there he frequented the race track, sketching the trotters on scraps of paper. In elementary school he found drawing objects easier than writing words, and one of his early prizes was a crayon and watercoler set. Once graduated from grammar school, he had to go to work, and during the next fifteen years he held a number of jobs: he was a farm hand, coal unloader, junk dealer, and moving man. Pippin also tried to get jobs crating paintings in order to be able to touch and study oils. For seven years he worked as a warehouse porter, a job which left him little leisure for painting. When the United States entered the First World War in 1917, the twenty-nine-year-old Negro enlisted in the

New York National Guard, going overseas later that year with the 369th Infantry. In the front-line trenches in France, Pippin kept a full diary of his impressions and experiences in five-cent copy books. These notes he saved, and in later years they supplied him with considerable material for his canvases. Severely wounded in the right shoulder in September 1918, he was hospitalized for several months and finally sent home in May of the following year with an honorable discharge and the Croix de Guerre. When Pippin was released from the Army, the doctors pronounced him unfit for work. Twenty-six years later, in a notification dated September 13, 1945, Pippin learned from the Army that he had been awarded the Purple Heart for wounds received in action on September 29, 1918.

In 1920 Pippin married Ora Giles of South Carolina and settled in his home town of West Chester, where the couple lived simply on his disability pension and Mrs. Pippin's earnings as a laundress. In the long years of his convalescence the veteran always wanted to paint but was unable to raise his right hand to shoulder level. He finally hit upon an idea: with a hot iron poker he burned an outline on an oak panel which he held in his lap. Later he filled in the design with color and in this way his first picture was created. After a year of patient, painful work in this fashion, the artist's wrist and arm grew stronger and he decided to attempt working at an easel. Supporting his right hand with his left, he began his first canvas in 1931, inspired by still-vivid war memories. For three years he worked on this first large picture, a powerful war scene called *The End of the War—Starting Home*, which depicted enemy soldiers surrendering amidst bursting shells. The picture was painted in the heaviest impasto, like others of Pippin's early period, for, according to a writer in *Art News*, "in his eagerness to convey the depth and texture of the bomb-torn earth he frequently built up his surface with nearly fifty coats of house paint." (This work is now in the collection of the Philadelphia Museum of Art.) These first works revealed the intensity of war experiences that Pippin had stored up within himself; his early canvases were "strange and compelling" war scenes.

For several years the artist's work was unknown except to his friends; then, in 1935, Dr. Christian Brinton of the West Chester Art Center became interested in Pippin's paintings. In May 1937 Dr. Brinton arranged an exhibition for him at the West Chester Community Center. By this time Pippin had been supplied with proper painting equipment and his technique had begun to change. In 1938 the New York Museum of Modern Art included four of his pictures in the exhibition, "Masters of Popular Painting." In this, his first New York showing, Pippin attracted considerable attention. There followed successful one-man shows in Philadelphia, New York, Chicago, and San Francisco. Pippin's first exhibition at the Carlen Gallery in Philadelphia in early 1940 created somewhat of a furor in that city's art circles. The introduction to the catalogue for the show, written by Dr. Barnes, the noted art critic reputed to own the finest private collection of modern art in the country, stated: "The facts that the work seemed crude in the sense that it lacked skill and finesse in the use of paint, and that it showed no evidence of borrowings from any old or modern artist, bore out the claim that Pippin had had neither academic training nor contact with the work of other painters. It was as primitive as the drawings of the prehistoric cave dwellers and it had the ruggedness, stark simplicity, vivid drama, naïveté, accentuated rhythms, and picturesqueness characteristic of the spirituals of the American Negro." Dr. Barnes considered Pippin's closest artistic kinship "with the group of natural, untaught painters to be found at all periods and in all nations, and to which custom has attached the word 'primitive.'" Reaction to the Carlen exhibition was discussed at length in the local press and is summed up by the headline of one such article: "Pippin's Paintings Create Sensation in Philadelphia." Dorothy Grafley, writing in the Philadelphia *Record*, declared: "What many an artist spends years learning Pippin knows by instinct. He is a remarkable designer, and a master of black, white, blue, and green contrasts. He holds pattern to simple essentials; yet has a grasp of perspective that baffles academicians."

Carl Van Vechten

HORACE PIPPIN

In the fall of 1940 Pippin made his long-awaited Fifty-seventh Street debut when the Bignou Gallery in New York held an exhibition of his work. Pennsylvania's modern primitive won critical commendation for his sincerity, naïveté, and boldness with colors. One critic was especially impressed by "the variety in his arrangements with regard to the interrelationships of mass, line and color," while the general consensus agreed that the show was "extremely interesting." Critic Bryan Holme found Pippin's work reminiscent of the famous French painter, Henri Rousseau, and also noted "a tinge of Matisse[’43]." Previously Barnes had compared Pippin to the noted American painter, John Kane, an opinion which Holme enlarged upon, declaring:

PIPPIN, HORACE—*Continued*

"Of all American painters Pippin comes closest to John Kane, but at times his painting definitely has more charm than any of Kane's canvases can boast." Robert M. Coates of the *New Yorker* judged Pippin's work "precise, sharply drawn, and minutely detailed," boasting "a kind of natural sophistication in the use of color that is at times surprising." Through the Bignou show the artist's development could be traced, both in technical growth and thematic change. The change in subject matter from war to peace and in color from "a gray, restricted palette to one more vivid and varied," was noted by one writer. While Pippin's early works were usually limited to three or four dominant tones, his later pictures use many intense colors, such as saturated greens and fiery reds.

In 1941 Pippin's works were exhibited at the Art Club of Chicago and the following year at San Francisco's Museum of Art. Commissioned to paint a picture for the Capehart series in 1943, he produced *I'se Comin'* which appeared in color reproductions in various magazines including *Life, Time,* and the *New Yorker.* In March of the next year the Downtown Gallery in New York held an exhibition of Pippin's recent works after having previously included the artist in their show, "American Negro Art." Margaret Breuning, who reviewed the Pippin exhibit in the *Art Digest* (March 1, 1944), noted the vitality and charm of Pippin's canvases, and found that he had "gained in power of expression as well as subtlety of color relations." This critic was especially impressed by the genre scenes and the flower paintings which "display great lushness of color and richness of textures resolved in a harmonious soundness of simplified statement." The Downtown Gallery reported the Pippin exhibition "close to a sellout." In October 1944 the artist was represented in the Carnegie Institute exhibition, "Painting in the United States, 1944," at which his landscape, *Cabin in the Cotton,* won fourth honorable mention and one hundred dollars in the competition judged by prominent art experts. Widely exhibited and reproduced in several magazines, it caused some controversy in artistic circles.

Horace Pippin's painting *The Holy Mountain* was chosen in 1945 for inclusion in the *Encyclopædia Britannica* collection of twentieth century American art. The artist's humbly eloquent letter about his picture (published in the *Art Digest,* April 1, 1945) reveals its biblical inspiration and the passionate hope for peace which motivated Pippin. Of the series of white crosses in the background of the painting, Pippin says: "Now my picture would not be complete of today if the little ghost-like memory did not appear in the left of the picture. As the men are dying, today the little crosses tell us of them in the First World War and what is doing in the South today—all of that we are going through now. But there will be peace."

In January 1941 one critic expressed the hope that Pippin's contact with other art "will not cause his painting to become less fresh and stimulating in the future." However, it has since been noted that the Negro artist's development "has not been arrested by copying traits or techniques individual to particular painters or traditions," but rather that his artistic growth has been evidenced in a more comprehensive knowledge of how to apply paint and how to use and coordinate color, line, light, space and pattern. Generally classed as a primitive, an instinctive painter, "with an inner vision of burning intensity," Pippin is said to possess an "extraordinary sense of design, color, and perspective." One writer believes that the artist's sophistication has gradually eliminated the "primitivist" label and Edward Alden Jewell has suggested his classification as a neo-primitive. N. C. Wyeth's appraisal of Pippin finds "a basic African quality" in his work while another critic pronounced Pippin's art "distinctly American." To a writer for the New York *Sun* in 1944, "His colors have the boldness and the clarity of a flower garden seen after a rain and his instinct for decoration is unfailing," and another admiring critic declares: "Perhaps Pippin's outstanding distinction is the fertility of his ideas in compositional arrangement." Edward Alden Jewell, noting the painter's technical progress, found "solid artistic virtue" in *Birmingham Meeting House in Late Summer,* but termed *Lady of the Lake* "no more than quaint—quite sincere, no doubt, but obscurely fanciful rather than creatively imaginative." Margaret Breuning has described *Sunday Morning Breakfast,* "with its excellent give and take of rhythms and fine integration of figures in the design" as outstanding, commending also the remarkable vividness of the John Brown series by Pippin.

Pippin canvases are included in the permanent collections of the Whitney Museum, the Philadelphia Museum, the Pennsylvania Academy of Fine Arts, Barnes Foundation, Phillips Memorial Gallery, Albright Art Gallery, Rhode Island School of Design, and the Wichita Art Museum. Among the art collectors who own his works are Averell Harriman[41], Mrs. Plunkett Stewart, John D. Hamilton, and Alain Locke[44]. Theatrical people are reported to be among his most ardent collectors and according to one source in 1944, thirteen were waiting to purchase forthcoming Pippin paintings. Describing his personal artistic process, the artist has said: "Pictures just come to my mind. I think my pictures out with my brain and then I tell my heart to go ahead. If the idea is worthwhile, I paint it. I go over the picture in my mind several times. Then I start painting." Pippin works from the more distant objects to those in the foreground. "This throws the background away from the foreground," he explains. His ideas come from magazines, books, and his own memory and imagination. He still paints with his right hand propped up by the left and after six hours of work he is very tired, but he has worked as long as seventeen hours without a stop. Painting mostly at night, he still spends months on one picture. He works in the dining room of his small frame house.

A tall, broad, "open-faced" man with a flashing smile and a hearty laugh, Pippin has been described as a warm, religious person. In the words of one writer, "his sole reason for painting is his own satisfaction in his work." He himself has said, "My opinion of art is that a man . . . paints from his heart and mind. To me it seems impossible for another to teach one of art."

PORTER, PAUL A(LDERMANDT) Oct. 6, 1904- United States Government official; lawyer

Address: b. New Post Office Bldg., Washington, D. C.; h. 6001 Broad Branch Rd., N.W., Washington, D. C.

Appointed chairman of the United States Federal Communications Commission in December 1944, Paul A. Porter, has, in a short span of a decade, been lawyer, newspaperman, college professor, radio counsel, and government official. A "Porter competence," coupled with wit and genuine fondness for all sorts of people, has helped him ride out numerous storms in different posts without losing the friendship of an opponent.

Paul Aldermandt Porter was born October 6, 1904, in Joplin, Missouri. He is the son of John J. and Dolly (Carpenter) Porter. The family moved to Winchester, Kentucky, when he was three months old. Paul started working at fourteen to help support his widowed mother and the eight children. She got the fifteen-year-old boy a job as a reporter on the Winchester *Sun* where he clocked in at 5:00 A.M. for work before reporting for classes at the Clark County High School. He continued this schedule after he entered Kentucky Wesleyan College in his home town in 1921.

Three years later Porter determined to study law at the Law College of the University of Kentucky, from which he received his LL.B. in 1927. In 1925, while still at the university, the young student became city editor of the Lexington *Herald*, remaining with the paper until 1928, when he left to enter private law practice. Then in 1929 he was able to combine his two professional interests, law and journalism, by accepting a position as general attorney for Oklahoma Newspapers, Inc. He left this job in 1931, and for a year held a similar position with General Newspapers, Inc. Both of these legal posts involved contacts with southern and southwestern farm newspapers and gave to Porter an appreciation of the problems confronting the farmer.

While editing the chain's La Grange (Georgia) *News*, Porter took the bold step of throwing into the waste basket the "canned" editorials set up in type for small-town newspapers. Then he wrote his own. This led to his first Government job, for several of the columns he wrote on cotton in 1933 so impressed Secretary of Agriculture Henry A. Wallace '40 that he summoned Porter to Washington as a special legal assistant; and in 1935 he was made executive assistant to the head of the Agricultural Adjustment Administration.

His lawyer-editor mind and familiarity with agricultural problems and his strong sympathy with the principles of the New Deal made him the person for this position. Under his direction the AAA organized a publicity staff whose setup was comparable in design to a daily newspaper office, replete with reporters, copyreaders, rewrite men, and editors. Their output was distributed to correspondents in the form of mimeographed "handouts," skeletons of the fuller reports found later in the newspapers. A good number of the AAA's radio addresses were ghostwritten by Porter. Through his efforts an amendment which circumvented a 1926 restriction was adopted, making it possible to publicize price and production predictions. Porter's Amendment, as it is sometimes referred to, helped to boost the prestige of the publicity department. And Porter, weathering the 1935 "purge" within the AAA, when several key men of the agency were ousted, remained in office for two more years.

PAUL A. PORTER

In 1937 the young publicity man left the Department to become Washington counsel for the Columbia Broadcasting System, a position he held until 1942. Then in 1940, when the entrance of the United States into the war was becoming inevitable, Porter, on leave from CBS, became legal adviser and assistant to Chester C. Davies '40 on the National Defense Advisory Commission, a commission formed for the purpose of formulating a food program for an America at war. However, since very few people at this time recognized the possibility of there being a food problem in the impending conflict, the endeavor was shortlived (June to December).

The following year Paul Porter lectured on administrative law at the Catholic University College of Law in Washington, D. C., then left in 1942 to accept the position of deputy administrator in charge of rent control in the Office of Price Administration. During Porter's term in office the (Howard W.) Smith '41 Committee of the House of Representatives, investigating practices of executive agencies, attacked the rent office for "arbitrary, capricious" operations outside the "expressed mandates of Congress." One of the complaints

PORTER, PAUL A.—*Continued*

heard during the inquiry was that the office had been unfair to small owners on fixed rentals. Porter submitted figures to prove that, on the contrary, a survey of twenty cities showed that income from rentals had increased since the start of the war. At the end of the inquiry the committee reported that, on the whole, OPA rent control had been effective, although it criticized OPA methods, charging that the office had discriminated between landlord and tenant and had disregarded state and local laws. The CIO and the A.F. of L. for their part both voiced appreciation to the office for executing its responsibilities so successfully.

Porter resigned as OPA deputy administrator on June 1, 1943. Thirty days later he was shifted to the War Food Administration as associate administrator under Marvin Jones '43, to aid in the budgeting of the Nation's military, foreign, and civilian food requirements. Porter's short tenure of office (one month) with the WFA has been ascribed, according to Gardner Jackson of *PM*, to his opposition to various practices employed by Assistant Secretary of Agriculture, Grover B. Hill. It is believed that Porter felt that some of Hill's policies conflicted with the principles of price control and with effective food production. In August, therefore, he was free to assume the associate directorship of the Office of Economic Stabilization, as first assistant to Fred M. Vinson '43. He framed the Vinson directive aimed at forcing manufacturers to make more cheap work clothes and fewer luxury garments.

When, in February 1944, Charles Michelson '40 resigned from the post of public relations director of the Democratic National Committee, Stephen Early '41, President Roosevelt's secretary, suggested Porter for the vacancy. Harry Hopkins '41 seconded the choice: Porter knew the press and radio, had a good political sense, could write or make a good speech. Porter thus became publicity director for the Democrats in their 1944 Presidential campaign. The election won, Porter was named to a Federal post near the end of 1944: James L. Fly '40 had resigned as chairman of the Federal Communications Commission before the expiration of his seven-year term of office; and on December 21 President Roosevelt appointed Porter the new chairman. This was an interim appointment, "to give Porter experience" before the convening of the new Congress. In January the President's choice was approved by the Senate.

Paul Porter's post entails the issuing of licenses to radio stations and operators, and the regulation of interstate and foreign communications by telephone, telegraph, cable, and radio. The FCC is also engaged in promotion of safety at sea through the use of communication facilities. In addition, the responsibility which Porter inherited has been for the past few years the storm center of controversy among naval officers, the National Association of Broadcasters, the networks, and Congress, which in mid-1943, through a House committee (whose original chairman was Eugene Cox '43), had begun an investigation of the Commission. The subject of the investigation (occasionally labeled a "star-chamber" probe) was the power of the FCC to regulate broadcasting chains (upheld by the Supreme Court in May 1943) and its withholding of licenses for newspaper ownership of stations. In January 1945 the House committee submitted a majority report stating that it believed the Commission had functioned with "reasonable satisfaction" in almost every instance scrutinized during the inquiry. "The committee believes that this entire matter of newspaper ownership and the monopoly angle should be reviewed by the Congress with a view of providing the necessary new or clarifying legislation that should settle this problem." The minority report disagreed on almost every count, charging the FCC with assuming powers not granted to it by Congress.

In February Porter advised Director of War Mobilization and Reconversion James F. Byrnes '41 that nineteen thousand miles of leased wire circuits, with seven hundred extensions, and a large number of telephone sets previously used for the dissemination of racing information had been made available for essential civilian use as a result of Byrnes's ban on horse and dog racing the month before. Then a really complicated problem was presented to Porter. Late in March Navy Secretary Forrestal '42 told Congress that the United States had no stated policy governing international communications, that anyone could set up a radio, telephone or cable company, and that this sort of free competition was out of date. Forrestal advocated a monopolistic "chosen instrument"—that is, a merger sanctioned by Congress of all United States companies engaged in international communications into one big Government-backed corporation so that the United States could compete with similar foreign companies and send secretly its diplomatic and commercial messages. Porter too has urged a consolidation of overseas services but does not believe the Forrestal idea feasible because the FCC would have the job of regulating a corporation that included five Cabinet members among its directors, and in any question of national policy the Secretaries of War, State, Navy, Commerce, and Post Office could overrule the fifteen directors from private business. The taxpayer's stake is enormous, Porter told the Senate Interstate Commerce Committee on International Communications. The total cost of combined plant and equipment of the thirteen American companies now in the field is $133,500,000, and with book depreciation subtracted, $52,000,000. Compared to this is the Navy budget expenditure of $480,000,000 for purchase and maintenance of communications equipment for 1945 alone; and the Army investment is higher, Porter pointed out.

The Senate Committee desired to obtain all possible information before determining policy, according to Lowell Mellett '42, who endorsed its pivotal point: the conviction that any enduring peace must be based on the fullest understanding among nations and that this can be achieved only through the freest communications. Porter told the committee that cable rates were preposterously high, that the actual transmission cost by radio is about the same for a message traveling from New York half way round the globe as it is from New York to Boston. If a merger were enforced, then one big company could use either cable, radio telegraph, or radio telephone for sending messages most satisfactorily, Porter maintained, at the same time requesting permission for the FCC to withhold any recommendation until all the evidence was in. This included testimony from the thirteen companies concerned. The International Telephone and Telegraph Corporation and Radio Corporation of America generally favored a merger but the "American Telephone and Telegraph Company, which does not want anyone to cut into its telephone monopoly, and lusty, young Press Wireless, Inc., which now carries over half of all press dispatches in and out of the United States," are lined up against the one big company idea, according to *Time* (April 2, 1945). Both *Time* and *United States News* believed that a Government-controlled merger brings up the question of censorship and that this is the issue on which it may principally be fought.

Realizing that clear channel stations are now primarily serving metropolitan areas instead of the rural America they were originally intended to serve, Porter pointed out in April 1945 that nearly 57 per cent of the population got only inferior radio reception—a situation he called intolerable and which the FCC proposed to deal with shortly. Porter also warned broadcasting stations that "the spirit of the Communications Act of 1934 requires radio to be an instrument of free speech." Organized labor and cooperative organizations have long protested that the code of the National Association of Broadcasters is prejudicial to them and favors big business. The refusal of some stations to sell time on the air to unions and cooperatives has elicited Porter's warning that the NAB code "is inconsistent with the concept of public interest established by the Communications Act, as a criterion of radio regulation."

The swelling volume of complaints about "over-commercialism" of radio today brought Porter to the microphone and into print in a fatherly but fighting mood, admonishing both the public and the broadcasting stations of their responsibilities. "Radio Must Grow Up" was the warning title of Porter's article in the *American Magazine*, October 1945. "It must be clear to the radio industry that if it is to avoid legislative intervention to certain phases of its operation it should undertake to discontinue practices which are making the public angry," wrote Porter—and then addressed the public: "The air waves do not belong to the Government, or to the FCC, or to the broadcasting stations. They belong, by law, to you—the public. It is right and necessary for you to debate and seriously consider the nature of the guest who comes into your home." Urgent as this was before, it is doubly so now because radio has come to a turning point in its history, Porter continued, highlighting the scientific advances, especially FM (Frequency Modulation) which will open up a vast new empire.

The FCC has no power to censor the radio but it can revoke licenses in the public interest. When application is made for a permit to build a station, specific pledges are given that "time will be available for civic, educational, agricultural, and other public service programs." In the past the FCC has renewed licenses automatically for a three-year period, although the record showed that some licensees had not fulfilled the promises originally made to the commission. This practice, Porter said, would not continue in the future. Radio was operating under a statute drafted eighteen years ago when there were no nationwide networks and less than six and a half million receivers in homes. Today there are 933 stations licensed, four national networks, and upward of sixty million receiving sets. In 1944 advertisers spent $285,000,000 for air time, and net profits before taxes, as reported to the FCC by 836 stations, were 125 per cent over 1942. By revising the old Radio Act of 1927 Congress would, Porter believes, "doubtless take up questions of whether news should be sponsored at all, and consider proposals that certain hours of good listening time be withheld from sale entirely in order that stations would have no alternative but to broadcast sustaining public-service programs during that period."

In 1940 a FCC ruling had opened the air lanes to commercial stations using FM. (Frequency Modulation [FM], in contrast to the ordinarily used Amplitude Modulation [AM], signifies changing the length of the radio wave and thus eliminating static, as radio waves and static have the same electrical characteristics. This method of conquering static by means of a wide band Frequency Modulation was found by Edwin Howard Armstrong '40 as early as 1928.) The fact that any number of properly spaced FM stations could operate in the same air channel solved FCC's difficult problem of satisfying a greater number of license applicants. By September 1940 there were twenty-two experimental stations licensed, many applications for FM commercial stations pending. The war, however, put a temporary stop to their increase.

The prediction of a swift reconversion of the radio manufacturing industry from a wartime to a peacetime basis after V-J Day was not fulfilled. The delay was a result of both technical and economic issues peculiar to radio in general and to FM, the newest and most contested broadcasting art in particular. It was with virtually all phases of FM that there existed much controversy and confusion. The differences took in engineering factors (disagreement as to the width of the FM band), Government regulations, transmitter and receiver manufacturing, programing, Petrillo's demand that a double crew of musicians be hired if a musical program were duplicated on both FM and standard outlets, and also purely economic and competitive considerations. In spite of being temporarily unfavorable, however, the prospects of FM remained undimmed. In November, when the FCC scheduled hearings to allocate hundreds of channels available for FM stations, an intensive struggle for new broadcasting licenses set in. More than seven hundred applicants filed for permission to operate FM stations, the newest applicants being labor unions who up to that time had been barred from the air. Porter declared that the decisive factor in judging applications would be "public interest." He then added: "I can see nothing in the Communications act . . . that would discriminate against labor unions." Among other applicants there were educational and non-commercial groups as well

PORTER, PAUL A.—*Continued*

as major set manufacturers with large economic resources. At the end of 1945 Porter predicted that there would be one thousand FM stations on the air within three years and that they would supplant AM stations except in rural areas.

Late in November the United States and the nations of the British Commonwealth opened a telecommunications conference in Bermuda with an agreement that radio and cable rates should be cheaper and more uniform in the future. Porter, in his capacity as chairman of the FCC, demanded elimination of British monopolies in Greece, Saudi Arabia, and Iran, and maintenance of United States circuits to British nations and the Near East. At the close of the twelve-day conference all eight participating Governments signed an executive agreement cutting international communications rates, abandoning communications monopolies in other countries, and giving the United States the right to maintain direct radio circuits with the United Kingdom, Australia, New Zealand, and India.

In June 1930 Paul Porter was married to Bessie Edgar Benton, and now has two daughters, Betsy Goodloe and Ann Covington. Tall, six feet three, and weighing one hundred and ninety-five pounds, "lanky, affable" Porter has a medium complexion, wears rimless glasses. His favorite recreation is golf. The FCC chairman is a member of Sigma Alpha Epsilon and Phi Alpha Delta, the New York Bar Association, the Federal Communications Bar Association, and the National Press Association. His church affiliation is Baptist. He is known in Washington as "the story-teller with an inexhaustible stock pile of yarns" which "always have a point and more often than not emphasize an argument he is trying to register."

PORTER, WILLIAM N(ICHOLS) Mar. 15, 1886- Former United States Army officer

Address: b. c/o American Cyanamid Co., 30 Rockefeller Plaza, New York City

In the Second World War searing, probing fingers of flame reduced impregnable pillboxes and strong points of the enemy when other means failed; incendiary bombs burned out the manufacturing centers and arsenals of the Axis, reducing their means of waging effective warfare; and smoke that screened landing operations had the effect of greatly reducing losses among Allied invasion forces. Such developments of modern warfare are the charge of the United States Army Chemical Warfare Service, of which Major General William M. Porter was wartime chief.

William Nichols Porter was born in Lima, Ohio, on March 15, 1886, to William Harley and Ilva (Nichols) Porter. In 1909, at the age of twenty-three, William was graduated from the United States Naval Academy. He was assigned to the U.S.S. *Connecticut*, but after less than a year of service the young ensign in February 1910 resigned from the Navy. The next month he entered the United States Army, with a commission as second lieutenant in the Coast Artillery Corps. In July 1911 he was married to Gladys Baxter, the daughter of a naval officer.

Porter's first tour of duty was with the Forty-first Coast Artillery Company at Fort Monroe, Virginia; then after two months, in July 1910, he was transferred to the 168th Company. The following year, in September, he was shifted to the 145th Company at Fort Moultrie, South Carolina, where he remained until February 1913. (The previous September he had been made a first lieutenant.) His next duty was in Galveston, Texas, but five months later he was returned to his first post, Fort Monroe, and then in September of the same year served at Fort Andrews, Massachusetts. Two years later he went to Fort Mills in the Philippine Islands as assistant adjutant and adjutant of coast defenses of Manila and Subic bays, returning to the United States on July 15, 1918, after the United States had entered the war. During his stay in the East he had received two promotions: to captain in May 1917, to major (temporary) a year later.

During the remainder of the First World War Porter was stationed in the United States. For a brief period he first served at Fort Monroe, Virginia. In September 1918, when he was raised to the rank of lieutenant colonel (temporary), he was assigned as camp adjutant to Fort Eustis, and in October he was given the command of the Thirtieth Coast Artillery. He remained with the Thirtieth until January 1919, when he was transferred to San Francisco and given the command of Fort Miley. In May he reverted to his permanent rank of captain. In July he became coast defense adjutant at Fort Winfield Scott, where as a major he remained until September 1920. His last tour of duty as an artillery officer was at Camp Lewis, Washington, for on June 30, 1921, he was assigned to the Office of the Chief of Chemical Warfare Service, Washington, D.C., as the assistant executive officer.

The Chemical Warfare Service was set up as a temporary expedient in the First World War to meet the Germans' use of gas, flamethrowers, and aerial incendiaries. At the end of the war, in July 1920, a year before Porter's assignment, the department was made a permanent branch of the Army. During the next twenty-four years, while the CWS developed the equipment and methods of gas warfare, Porter kept pace with the technical and tactical advancement by his attendance at Army schools.

He first left the Office of the Chief of Chemical Warfare Service to take a five-month course at the Army Industrial College in Washington, from which he was graduated in January 1926. The following year he took the course at the Command and General Staff School, Fort Leavenworth, Kansas, and upon graduation in June 1927 became chief of the Training Division in Washington; two years later he was made executive officer of the department. Third on his list of Army schools was the Chemical Warfare School, Edgewood Arsenal, Maryland. Following graduation in August 1931 he was made assistant commandant of that school. In September 1933 he went to Maxwell Field, Alabama, as an instructor in and later director of the Department of Ground Tactics of the Air Corps Tactical School. While at this station he received his promotion to the rank of lieutenant colonel, in October 1934. Finally, in August 1937, he enrolled in the Army War College, the highest Army training school, and was graduated the following June.

Appointed as chemical officer of the Ninth Corps Area at San Francisco after graduating from the War College, Porter, now a colonel (December 1938), remained on the West Coast until April 28, 1940. He was then assigned as chemical officer of the General Headquarters Air Force at Langley Field, Virginia. On June 2, 1941, six months before Pearl Harbor, he was appointed Chief of the Chemical Warfare Service, with the rank of major general, effective from May 1.

America's entry into the Second World War at the end of 1941 presented the Chemical Warfare Service with many problems. At that time it seemed quite likely that the Germans would use poison gas. Under General Porter's direction the country's facilities for manufacturing equipment as a defense against chemical attack were expanded. However, the General did not stop at providing defense equipment. To Porter, "defense" was a "weasel word." Backing up this statement made to the American Chemical Society on September 10, 1941, he instituted a program for manufacturing poison gas in quantities far greater than it was thought the Axis countries could provide for their own use. Edgewood Arsenal, home of the CWS, was expanded; new plants were constructed at Huntsville, Alabama, Pine Bluff, Arkansas, and Denver, Colorado. The best scientific minds in the nation were mobilized under the direction of the National Defense Research Committee, headed by James B. Conant '41, president of Harvard University, and Roger Adams, head of the department of chemistry at the University of Illinois.

Out of these efforts came many innovations and improvements. One of these is the "Goon" gun, a 4.2-inch rifled mortar with an effective range of 3,200 yards. It can fire phosphorus shells, high explosives, gas, or smoke; a chemical battalion equipped with thirty-eight of the mortars can build a smoke wall three miles long and nearly 1,000 feet high, and maintain that wall for eighteen hours. In the European war the weapon was successful in tank attacks and in artillery battles with the famed German 88's (88-millimeter guns), which are thirty times heavier than the mortar. Developed by the CWS in 1942, it was called "America's secret weapon" by the Germans.

Rapid strides were also made in the employment of smoke as an aid in the attack as well as the defense. Smoke pots and smoke shells were improved, including a pot that will float on water. But the best "smoker" of all is considered to be the generator, resembling the old-fashioned horse-drawn fire engine, which can blanket an area one mile square in ten minutes. This smoke generator was developed by Irving Langmuir '40 and Vincent Schaefer at the General Electric Company's research laboratory; the first one was designed and made by the Standard Oil Company, from which it gained its nickname, "Esso."

U. S. Army Signal Corps

MAJ. GEN. WILLIAM N. PORTER

The flame-thrower and incendiary bomb, introduced by Germany during the First World War, have been developed by the CWS to a point of "tremendous effectiveness." There are seven distinct types of aerial incendiaries, which range in size from the four-pound firesticks to the five-hundred-pound "factory burners." The fuels in these bombs can be magnesium, thermite, phosphorus, or oil. Of all the varieties, the most spectacular is known as "fire-roe," a thickener for gasoline that resembles fish roe in appearance. It can also be used as fuel in the flame-thrower and produces an extremely high heat; it has the added advantage of sticking like glue to the places it touches when the container explodes or the flame is spurted from the flame-thrower. The Chemical Warfare Service during the war had stores of poison gas, too, which were held in reserve. These stocks, which were described as far greater than any supply available to either the Germans or the Japanese, were kept for retaliatory purposes only, for the United States refused to take the initiative in employing them.

The Chemical Warfare Service is by no means devoted entirely to offensive and defensive warfare, but includes research in preventive and curative medicine, sanitation, food and water contamination, and the effect of various gases on men and animals. Developed by Dr. Paul Müller '45, under the direction of Dr. Paul Läuger '45, the new insecticide DDT was improved for use by CWS in collaboration with the Department of Agriculture; and the medical division has made great strides in combating respiratory diseases, and in treating burns and heavy metal poisoning, to name a few. "There is no section of the Army," said Porter, "where plowshares and swords run so closely together." The CWS decontamination apparatus can be used to spray crops; smoke generators can economically protect fruit trees

PORTER, WILLIAM N.—*Continued*

against frost; the flame-thrower can be used remove ice and snow from airport runways, to throw back forest fires, or to destroy water plants which impede navigation; and the protective clothing can be used in dangerous chemical operations or to protect against cold and moisture. With the end of the war the Army was faced with disposal of enormous stocks of unused gases. Some will be broken down and used in industry, others will deteriorate in time and can be allowed to disperse in the air, and still others will be cast into the sea in non-rustproof casks where they will gradually leak out and do no harm.

William Porter is an Episcopalian, a member of the Army and Navy clubs and the Army and Navy Country Club in Washington, D. C. His son, William Baxter, followed in his early footsteps, becoming a lieutenant commander in the United States Navy, while his daughter, Margaret Baxter, is married to a Navy man, Lieutenant Commander L. M. Stevens. For his services in the First World War, General Porter was awarded the Belgian Order of Leopold. In February 1945 he was made a member of the executive committee of the Research Board for National Security, established by the National Academy of Sciences. Upon his retirement from the Army in November 1945 he became an executive of the American Cyanamid Company, in New York City.

Who's Who in America, 1944-45

POWERS, JOHN ROBERT Dec. 1896-
Model-agency director

Address: b. 247 Park Ave., New York City

"Can you imagine," asks the *Yale Record*, "a job of which the prime duty is to merely look after the most beautiful and shapeliest girls in the world? Can you imagine a profession which entails just sitting behind an office desk and interviewing daily between thirty and forty of the comeliest girls this side of heaven?" The man whose occupation fits this description is John Robert Powers. Owner of the largest and best-known model agency in New York and therefore in the world, Powers chooses from among the one hundred and fifty thousand mail and in-person applicants a year the three who will be added each month to his register, and then helps them to develop into successful models. Although his agency schedules appointments for persons of both sexes, and from the age of six months, he is usually identified with young beauties nationally known as "the Powers Girls," of whom there are one hundred and fifty at any one time.

Of Irish ancestry, John Robert Powers was born in Easton, Pennsylvania, in December 1896. Like many prominent Americans, he started life on a farm. After completing his secondary education, John made what he calls "a temporary halt" at Lafayette College, after which he managed to get small parts with various theatrical stock companies and in some silent films. "Though I played with Elsie Ferguson '44 and other talented actors," Powers recalls, "I never had my entrances greeted by a burst of applause. Producers and audiences alike were unimpressed. Kindly producers told me that I was wasting my talents; the rest told me bluntly I was wasting their time." But Sir Herbert Beerbohm Tree hired the young Pennsylvanian as assistant manager and understudy in his touring company. "While the pay checks were still coming in regularly," Powers was married to blond Alice Hathaway Burton, who gave up her work on the stage to become Mrs. Powers.

Powers stayed with Sir Herbert for two years (Tree died in 1917), but after the First World War he found himself jobless again. After making the rounds of all the theatrical agencies in New York, "more from force of habit than with any real hope," he answered a newspaper advertisement calling for models for a commercial photographer. The photographer needed eight men to pose for clothing advertisements, whereupon Powers rounded up seven of his unemployed actor friends, and they got the job. ("Today most of them are famous stars," he says.) Commercial photography by 1921 was only about three years old, and not very well organized. When an artist or photographer needed a model, he advertised for one. What he got was usually out-of-work actors or chorus girls, and "with the best will in the world" the latter "were unable to make themselves look like anything but chorus girls," which was no help in posing as housewives or debutantes. And there was no organization for bringing photographers together with prospective models.

Powers gives his wife credit for the idea of creating such an agency. His method was simple: "I got in touch with everyone I knew, friends, acquaintances, and their friends and acquaintances, had their pictures taken, made up a catalogue containing their descriptions and measurements, and sent it to anyone in New York who might be a prospective client—commercial photographers, advertisers, department stores, artists. There were not more than forty people listed in that first catalogue, but the idea was a new one. Not only the photographers but the advertisers began to see its possibilities. . . .While I had started with the idea of supplying a demand, I began to discover that I was creating one. The advertisers were quick to see the tremendous sales possibilities represented by lovely girls whose youth and beauty appealed to everyone, men and women, old and young alike. A beautiful girl's smile sold more tooth paste than the most telling copy that could be devised. A photograph dramatized a product more effectively than columns of words. Dresses worn by an attractive girl were more interesting than the same dresses hanging on a rack or draped on a wax figure"—and Powers got 10 per cent of each model's fees.

The Powers agency was not the only one to be set up—Walter Thornton was an early rival, and others came later—but it became the largest. Powers encouraged his models to go on to other fields. In 1924 he had to persuade the future Barbara Stanwyck to accept a tiny movie role at the Cosmopolitan studio. "Anyone who can pose, can act," he told her. Powers estimates that about fifty of his men and girls have gone on to success in Hollywood and on Broadway; the number includes Joan Bennett, Joan Blondell, Georgia Carroll, Dolores Costello, Kay Francis, Paulette Goddard, Anita Louise (a child model), Marie MacDonald, Norma Shearer, Gene Tierney, and Helen Vinson. Before they became famous Rosalind Russell '43 and Jennifer Jones '44 filled some assignments through the Powers agency, as did Henry Fonda, Tyrone Power, and Fredric March '43. Other Powers graduates have become stylists, fashion editors, clothes designers, and a number of Powers Girls have made wealthy marriages, among them to Woolworth Donahue, Marshall Hemingway, and Winthrop Gardiner.

John Powers takes a personal pride in the "social acceptability" of his models, in contrast to the exclusion of the earlier mannequin. He attaches importance to their "looking and acting like ladies"—for advertising and illustration models must appeal to women even more than to men. After the financial crash of 1929 many young ladies of prominent families found it necessary to earn money to pay for their debuts. The first to become a model was Elsie Little of New York; she was followed by other debutantes, including Halldis Prince of Boston, Pat Plunkett, Mimi Richardson, and Ridgely Vermilyea. Some, like Babs Beckwith (Mrs. Winthrop Gardiner), continued their modeling after marriage, as do more than half the Powers Girls.

During the depression of the 'thirties Powers prospered, for when buying was slow advertising became even more important. In 1930 the photographic modeling field was still so little known to those outside it that when Marie Beynon Ray wrote an article tracing the history of the mannequin for the April 1930 *Mentor*, the only contemporary model she mentioned was "the minx who parades the dressmaking establishments." By 1935 magazine writers were beginning to tell the public that "in New York about a hundred and fifty men and women are earning an average of more than twenty-five dollars a week as photograph models [in addition to several hundred part-time models]. About one hundred and twenty-five of them are girls. Men usually take it up only until they can get a job at something else. Perhaps twenty-five or thirty of these girls make around seventy-five dollars a week, and an additional eight or ten who demand at least ten dollars an appointment—and get it—average one hundred dollars or more." At this time there was also a great demand for babies, particularly with curls and dimples à la Shirley Temple, or in batches of five as popularized by the Dionnes.

In 1937 Harry Conover, a model whose picture is still being used in hair-tonic advertisements, left Powers and opened his own agency, with the help of top-flight model Anita Colby. In contrast to Powers, Conover introduced the star system into modeling, playing up individual girls and thinking up such names are Candy Jones, Dusty Anderson, Choo-Choo Johnson, and Melody Thomson. Since then Conover has built up the identification of his clients as Conover Cover Girls, while Powers began to place somewhat more emphasis on the individual "Long-stemmed American Beauty" (phrase by the illustrator Arthur William Brown).

JOHN ROBERT POWERS

In 1937 there were fifteen telephones incessantly ringing in Powers' inner office; by late 1940 the number had risen to twenty-three, on which appointments were made for the four hundred models registered with Powers. All ages and both sexes were included, but as always the main attention was focused on the pretty girl, who by then was known around New York simply as "a Powers Girl." Powers Girls, as such, had become a decided feature of cafe society; Powers quotes Elsa Maxwell '43 as saying that she could give one of her famous parties without debutantes, but not without at least half-a-dozen Powers Girls. Wrote E. J. Kahn, Jr., in the *New Yorker*, "Gossip writers, who would rather be specific than otherwise, occasionally mention a male night-club habitué by name and say that he was seen out with 'a Powers model.' This . . . is merely an admission that columnists simply cannot tell Powers models apart. Few people can." From photographs and fashion shows, the Powers Girls branched out into other forms of promotion. Manufacturers of all sorts of products, from automobiles and luxury cruises to international good will, hired professional beauties to travel across the country or even to other countries to demonstrate their products.

The name John Robert Powers became better known to New Yorkers in 1940, when the New York Subways Advertising Company asked him to make monthly selections of "Miss Subways" for one of their eleven car-card features. And the bookshops began in 1941 to carry his *The Powers Girls*, a detailed guide to the modeling field which also includes a bit of autobiography. The author mentions, too, the Powers School, which gives a ten-week course (tuition, $200) of private instruction in charm—health, poise, posture, grooming, "make-down," voice and diction, patience, responsiveness, grace, and the proper choice of coiffure, clothes, and accessories. The course in "Vitality and Grooming" is taught by Powers' wife, Alice Burton Hathaway. The Powers

POWERS, JOHN ROBERT—*Continued*

School training differs from the pioneer charm course, the DuBarry Success School of the Richard Hudnut salon, in that it covers more ground and concentrates more on how the student acts, as opposed to how she looks. In February 1943 an individualized correspondence course (seven weeks, $25) was added, which has been taken by thousands of women. "Students are urged to write to the school for information on individual problems that arise during the course," reports Juliet Bridgman in *Liberty*. "They all get answers, too. This has brought on a lot of overtime work for the faculty. One woman wrote fifteen letters, and some of her questions perplexed the faculty until she explained that her husband was taking the course with her, exercises and all. Did him a world of good, she said."

Powers bears little or no resemblance to Alan Mowbray, the actor who portrayed him on the screen in *The Powers Girl* (1943). He is a solidly built, young-looking man, long-nosed and thin-lipped, with wavy black hair and very heavy eyebrows above eyes which almost disappear when he smiles. A 1936 interviewer reported that Mr. and Mrs. Powers were given to four-o'clock-in-the-morning horseback rides near their Huntington (Long Island) home. From nine-thirty on, however, Powers is generally to be found at the reception desk in his Park Avenue office. He does not quite trust anyone else to choose the potential Powers Girls from the scores of self-conscious, badly dressed, over-made-up applicants. "In one week, by relying entirely on the estimate of someone else," he says ruefully, "I lost several girls who later became very successful."

PUGMIRE, ERNEST I(VISON) Mar. 4, 1888- Social service leader

Address: b. Salvation Army Headquarters, 120 W. 14th St., New York City; h. 186 Boulder Trail, Yonkers, N. Y.

Since its inauspicious beginnings in the slums of London in 1865, the Salvation Army has become a widely known international organization whose blue-uniformed workers are serving in ninety-seven countries and, in 1945, on twenty-five war fronts. Never deviating from their own rigid standards of conduct and their purpose of spiritual regeneration accompanied by practical social service, the Salvationists have marched on, indifferent to the smiles their bonnet hats, jangling tambourines, and street-corner bands may provoke. Heading this "soul-saving" army in America and directing its many useful activities is Ernest I. Pugmire, National Commander and also Commissioner of the Eastern Territory. A vigorous and active person, Commander Pugmire grew up in the Army and has served in four countries.

Son of Joseph and Marian (Ivison) Pugmire, Ernest Ivison Pugmire was born in Kansas City, Missouri, on March 4, 1888. Major Pugmire (who later became Colonel) came from Penrith, England and had at one time been known in Salvation Army circles as the "Singing Evangelist." He was one of the pioneers of the Salvation Army in America, helping in the organization of Salvation Army corps in eight states. Soon after the birth of his son, Ernest, he was recalled to England and during the next ten years was transferred successively to Canada, Bermuda, Canada, then England and back to Toronto where he and his family stayed for the next seventeen years. Before Ernest was ten he had crossed the Atlantic four times.

Ernest attended public schools in Toronto. He experienced a religious conversion at the age of ten, and while still in school he was an active member of the Salvation Army Cadet Corps and played the horn in the Salvation Army band. However, at about the time he finished school he began to question his religious faith—for the son of a Salvation Army officer, an extremely serious matter. He considered leaving the Army to prepare for a career which would give more scope to his business ability, but he was dissuaded by two Salvation Army officers for whom he had a strong personal admiration. One of these men, whose secretary he became, was Commissioner Coombe of the Eastern Canadian Territory. Soon after this Ernest entered the Salvation Army Training School for officers. In 1906 he received his commission as captain and was appointed to the finance department at Toronto headquarters.

Five years later, in 1911, Pugmire was married to Captain Grace Vickers, a corps commander who had also been commissioned at the Training School in Toronto. Born in London, she had done Salvation Army work in St. Albans and Southsea, England, before coming to Canada with her parents in 1905. A few years after his marriage, in May 1914, Pugmire had a narrow escape from death when the *Empress of Ireland*, on which he was sailing for England, sank in the St. Lawrence River with the loss of more than a thousand lives.

In 1915 Pugmire received his first important advancement when he was called to Winnipeg as financial secretary in the Western Canada Territory which had just been opened by the Salvation Army. From there, in 1918, he was transferred to China to serve again as financial secretary, and a year later he was moved to Japan. Here he acted first as financial secretary under Commissioners Johannes de Groot, Charles D. Duce and William E. Eadie, then as chief secretary under Commissioner Gunpei Yamamuro, the first native-born commissioner of the Japanese territory.

Before Commissioner Pugmire arrived in Japan, the Salvation Army had become strong enough to march into Tokyo's geisha district and attempt to free some of the geisha girls. Though the attempt was met with some violence, it focused public attention on some of the worst conditions and resulted in slight improvement in the situation. At the time of the Tokyo earthquake in 1923, Commissioner Pugmire was away from the city but after great difficulty he was able to return to it. The Salvation Army headquarters had been destroyed and there had been considerable loss of life, but the Army survivors were already starting to organize relief, which included shelters, especially for women and children, nurseries for very small children, and food centers. Comparatively few meals were given free as the Japanese did not wish to accept food as a gift from the foreigners, although they were content to pay a fraction of the cost price. It was after this, while Commissioner Pugmire was still in Japan, that General Evangeline Booth '41 visited the country and had an audience with the Emperor at which she appeared in her Salvation Army uniform—the only occasion on which a woman had appeared at a court function in anything except a formal court dress.

While in China, before going to Japan, the Pugmire's first child was born, and a second child was born in Japan. But although she had these small children to care for, Mrs. Pugmire carried on active social work among the women, according to Salvation Army custom. Both Commander and Mrs. Pugmire felt that the Salvation Army work in Japan was very successful; not only were converts made among the under-privileged but also among middle-class Japanese. The Pugmires believe that at the termination of the Second World War those of the Japanese Salvation Army who survive will emerge still loyal to the religion to which they were converted.

Salvation Army
ERNEST I. PUGMIRE

In 1931, after twelve years in Japan, the Pugmires returned to Canada, this time to Winnipeg. A year later the Commissioner was at long last transferred to the country of his birth and became chief secretary for the United States Central Territory. Less than two years later he was appointed territorial commander for the Southern States, and in 1939 he was made commander of the more important Central District. Having served as colonel and lieutenant commander, he was made a commissioner in 1939. In 1942 he was appointed Commissioner of the United States Eastern Territory, which includes the New England states and New York, New Jersey, Pennsylvania, Delaware and Ohio, and is, next to London, the largest and most influential command in the Salvation Army. In this territory are 1,770 officers of the Salvation Army, 1,979 employees and 205 Salvation Army-operated social service institutions. In 1944 Commissioner Pugmire was appointed Commander of the Salvation Army in the United States, still retaining his position as Eastern Commissioner, and this yearly appointment was renewed for 1945. In his dual role of National Commander and Commissioner of the Eastern Territory, Commander Pugmire is second in command to the international leader of the Salvation Army, General George Carpenter '43 who succeeded Evangeline Booth in 1939 as the fifth general to be elected.

The Salvation Army has a system of government organized on a quasi-military basis, which requires unquestioned obedience from its members. Each country is divided into territories, under a commissioner, and each territory is divided into provisions, divisions, and corps, the latter being under the direction of a captain and a lieutenant. From its inception the Army has tried to improve social conditions in order to pave the way for evangelization, believing

PUGMIRE, ERNEST I.—*Continued*

that bad physical and environmental conditions make it difficult for people to apprehend the spiritual message. "The surest way to lead a needy person back to God is first to serve him when he is in need," the Salvationists say. The Salvation Army maintains homes for unmarried mothers, day nurseries and infant hospitals, settlement homes and summer camps for children, and clubs for boys. It also operates employment bureaus, hotels and cafeterias, clinics and rehabilitation centers and gives prisoners' aid service, immigration and citizenship service, and conducts missing persons bureaus. Under Commissioner Pugmire's leadership the Salvation Army entered the battle against juvenile delinquency, which had increased considerably during the war, and in 1945 opened the first of a group of psychiatric clinics serving both servicemen and civilians.

The record of the Salvation Army's service in the Second World War is impressive. Reporting on it in September 1945, Commissioner Pugmire disclosed that the work, carried on in ninety-seven countries and territories, took its diversified activities to all the Allies on twenty-six fighting fronts. "Invasion canteens" rolled down the ramps of LST's along with jeeps, trucks, and tanks, and improvised huts were set up on beachheads, in jungles, and desert outposts. The soldiers called the beachhead Salvationists "strictly first-line operators"; there were casualties, beginning with Dunkerque, when only two of the score of canteens returned to England. In the United States the Salvation Army clubs, some operating in conjunction with the USO, provided sleeping accommodations for a million and a half men on leave or furlough; almost a million soldiers asked for and received individual counsel and 260,000 soldiers had voice recordings made to send back home in addition to those made in hospitals. Other war-related services included a home in France where children returned from Germany might remain until their parents were found, a refugee boys' home and "warphanage" in China, soldier and sailor rest homes in South America and the Middle East, homes for evacuées from England's bombings, grocery stores in Canada for stranded families in boom towns, dining rooms in the United States for children of war workers, restaurants in Belgium for child and adult refugees, and hostess houses throughout the United States for families and friends of enlisted men. Salvation Army chaplains served with all armies of the Allied nations, adapting religious observances to circumstances and location—religious guidance and consolation were given to all requesting them, regardless of creed, race, or color.

Discussing the servicemen's clubs, Commander Pugmire said: "What servicemen want in their free time is to get out somewhere—get away from authority. We don't try to proselytize. We don't try to coerce them into enjoying themselves. We don't try to make them dance if they happen to be in the mood to write a letter home. We don't insist on their hearing popular music if they prefer—and you'd be surprised how many do—Beethoven or Tchaikovsky."

Toward the close of 1945 the Salvation Army adopted an expanded program designed to give five types of aid to veterans. It had been carefully planned to avoid overlapping or duplication of Government or other programs for veterans. The five types of assistance include family aid, emergency assistance, aid of an informational nature, vocational-rehabilitation aid, and spiritual help. The program, according to the Commissioner would be carried out in 1,867 cities and towns in the United States.

Commander Pugmire is described as a fluent and effective speaker, a man with a photographic memory; he rarely forgets a thing which he has seen written down. He has always been fond of exercise and of outdoor sports, particularly tennis, although he regards sports more as a means of keeping fit than as recreation. He reads widely, especially biography, history, and economics. Although the Pugmires have five children, Mrs. Pugmire has been a leader in women's work wherever they happened to be stationed. (Salvation Army officers are permitted to marry only "under the flag"; after marriage the wife shares her husband's title and as far as possible his work.) A woman of unusual charm and an experienced leader, she is now territorial leader of the League of Mercy which was organized for the purpose of visiting prisoners, sick persons, and others needing attention or sympathy.

RAMA RAU, SANTHA (rä′mä rou săn′thä) Jan. 24, 1923- Author

Address: b. c/o Harper & Bros., 49 E. 33d St., New York City

For its refreshing, readable contrast to serious and weighty works on the complex problem of India, an autobiographical book by Santha Rama Rau, a Hindu girl educated at Wellesley, has won the unanimous approval of American critics. Informal, humorous, honest, and explicit, *Home to India* (1945) should—according to reviewers—do a great deal toward clarifying and interpreting India to the West. In midsummer 1945 the book was on the nonfiction list of best-sellers.

Its author is entitled by birth to wear on her forehead the distinguishing mark of "one of the most rarefied subdivisions of the Brahman caste." Santha Rama Rau was born January 24, 1923, in Madras, India. Her Cambridge-educated father, Sir Benegal Rama Rau, had married Dhanvanthi, daughter of Pandit R. K. Handoo, and was serving in the Finance Department of the Government of India when Santha and her sister Premila were little girls. The girls traveled with their parents to their father's various stations in India. When he was appointed a member of the Round Table Conference in London, Santha was taken to England and sent to primary school in Weybridge, Surrey, then to St. Paul's in London. Later, when he was Deputy High Commissioner for India, her father remained in the London headquarters. Since he had to attend a good many conferences in European capitals, during vacations Santha and Premila joined their parents and saw a good deal of Europe. Then, in 1938, her father was appointed Indian High Commissioner in South Africa, and the following year the family visited him there. When war broke out in Europe it was impossible for them to get return passage to England. Accordingly, her mother took the girls back to India with her.

It was then, at sixteen, and with her viewpoint shaped by her life and education in England, that the young Indian girl saw her native land after years of absence. Santha Rama Rau wanted to understand India, to understand also the complex differences between Eastern and Western cultures, between the ruling and the ruled, between herself and those who had never left India. Her mother gave her this advice: "Feeling at home here and, as you put it, understanding Indians, is mostly I think a matter of having something to contribute to Indian life—something, that is, that Indians want—and of having or acquiring the technique of contributing it."

In order to learn what she might contribute, Miss Rama Rau traveled through her native land, accompanied by several servants. Her travels included an interlude of camping in the Himalayas, which was recorded by a staff photographer from *Life* Magazine. But Miss Rama Rau managed to see a good deal of the poverty and misery, the ignorance and filth that were the ordinary lot of many Indians. She talked also with the younger Indians in the Congress Movement, and she decided that she stood with Gandhi '42 and Nehru '41 on the question of political independence.

Because she had crossed water, eaten beef, and neglected to wear her caste mark, Santha Rama Rau had lost the privileges of her religion and caste, but she was still forbidden to marry outside her Brahman caste. She had not only to grapple with these problems, but with those of color and of race prejudice. No Indian, whatever his caste, was allowed to enter the British clubs in India (in South Africa she had seen signs, "Indians, natives, and wild dogs not allowed"). There were social and other conventions which Miss Rama Rau and her sister felt were "not only retrogressive and socially crippling to the country, but also a little ridiculous." When she inadvisedly invited an English boy to her grandmother's house, she had to forestall his arrival by meeting him at a club: Europeans are not received in strict Brahman homes.

But the sympathies of the British-educated girl were nevertheless with India—and she wanted to join other young Indians working to better conditions there. "Here things were just beginning," she felt. "Here anybody could be a pioneer." Most of all, she felt the need of a working knowledge of the "mechanics of democracy." Since British intentions were distrusted in India, Miss Rama Rau decided to go to America to study, and Wellesley was the college her mother chose for her.

SANTHA RAMA RAU

At Wellesley, which she entered in 1941, Miss Rama Rau specialized in English while learning what she could about the workings of American democracy. She put her education to practical use by writing for the News and Features Bureau of the Office of War Information in New York during college vacations. After her graduation with a B.A. degree in 1944 she worked for several weeks with the Commission to Study the Organization of Peace. She then began her book, *Home to India*, which was published in May 1945.

Her experiences and impressions have been written—as Orville Prescott noted—from a point of view that is "partly that of a tourist and partly that of an initiate of Indian affairs." Lewis Gannett '41 called the book the only one about India that he had read which was "young and gay." Other reviewers, too, gave it a warm reception. The New York *Herald Tribune* book reviewer said that it was "worth one battleship, two cruisers, and three regiments in the difficult business of making one world. . . .A more delightful, more honest little book it is difficult to imagine." The New York *Times*' critic found it a calm, sincere plea for Indian nationalism. According to the *Christian Science Monitor*, it "may succeed in interpreting India to the West in a way which more weighty volumes often fail to do."

Santha Rama Rau is described as tall, slender, and attractive, fond of tennis and dancing. She has traveled in New England and has lived in New York City, where she had a studio apartment in a modernized brownstone house. There an interviewer found her wearing not her usual Indian sari, but "a white jersey dress, with bobby socks and white sandals." In fact, the writer commented, "she looked as if she'd just stepped off a nice cool tennis court." Speaking of the Indian people, Miss Rama Rau said many were tenant farmers and sharecroppers, and she thought a project like the TVA and a planned agricultural economy would be the sort of New Deal India wanted—provided the British withdrew and

RAMA RAU, SANTHA—*Continued*

gave India independence. In July 1945 she returned home, planning first to spend a long vacation with her family in Kashmir, then to find some way to participate usefully in Indian affairs.

RANK, J(OSEPH) ARTHUR Dec. 23, 1888- British motion picture producer; industrialist

Address: b. 49 Park Lane, London; h. Heathfield, Reigate Heath, Surrey, England

J. ARTHUR RANK

Admirers of J. Arthur Rank, Britain's film czar, prophesy that Hollywood producers, long accustomed to dominating the world film market without appreciable opposition, may soon have to exert themselves to meet his competition. For the ambition of this British industrialist, owner of 60 per cent of British film production facilities, is to create a market for English films where American films have heretofore held unchallenged sway and, incidentally, to recapture some of the money which has been drained out of the Empire.

Joseph Arthur Rank was born into the Methodist background which has colored his entire life on December 23, 1888, in Hull, Yorkshire. His mother was Emily (Voase) Rank. His father was the unobtrusive but fabulous Methodist industrialist and philanthropist Joseph Rank, who transformed the inheritance of a Yorkshire grain mill into a hundred-million-dollar flour industry which today (under the management of his sons J. Arthur and James Voase) supplies an estimated one-fifth to one-third of England's total requirement of that commodity. The boy attended the Leys School in Cambridge, and Western College, West Riding, Yorkshire. But at the age of seventeen he left school to enter the family business—by now the industrial empire of Ranks, Ltd.—as a thirteen-hour-a-day junior clerk. After serving his apprenticeship, Rank was appointed manager of Peterkin's Self-Raising Flour, a Rank subsidiary—and proceeded to lose, according to *Fortune*, a million pounds. It is said, however, that this is the only time that Rank has lost money and that his father attributed the incident to lack of experience. During the First World War Rank served with a field ambulance unit in France, and in 1919 he returned to the management of his father's flour mills. Until 1935 the milling industry continued to be his primary concern and he remained a familiar figure in "the City" (the Wall Street of London).

In the middle thirties, however, Rank's zeal for Methodism determined his investment of some of his fortune in an effort to raise the standard of religious films then being shown to Methodist Sunday school children. Forming the Religious Films Society together with his father and others, Rank began his connection with the motion picture industry by financing several religious shorts. At the same time he helped finance a film of life in Yorkshire fishing villages entitled *The Turn of the Tide.* Although this picture achieved third place at the International Film Exhibit held in Venice, it received few showings in Britain, and Rank turned to the box office to find out the reason. While he was "still poised on the threshold looking at it," continues *Fortune*, "and deliberating whether to gamble his extra energy and his money on [the industry]. . . Lord Portal and the banking firm of Japhets pushed him into it." Acting for the Board of Trade, Lord Portal had singled out Rank—who had both the capital and the apparent interest—to rescue the British motion picture industry from imminent collapse.

Since its beginnings the British film industry had operated at a loss because of its inability to meet the competition of Hollywood, which was accounting for as much as 87 per cent of Britons' screen fare. In an attempt to remedy the situation, the Government had established film quotas in 1927. But this move had resulted only in a scramble for the new market on the part of small, inexperienced British producers and American companies incorporated in England, all producing poor films. Hollywood products continued to dominate the English screen, and a ten-million-dollar loss in a cinema investment, such as that sustained by the Prudential Assurance Company, became not uncommon. In the marketing of Alexander Korda's *The Private Life of Henry VIII*, however, Lord Portal had seen a corrective for the existing conditions. A good picture, it had made money not only in England but in the United States. If, therefore, Britain could produce more pictures which would make money in the United States and use the profits realized to finance other pictures, these pictures could compete in the world market, especially in the United States market, which constituted 65 per cent of that market—and the problem of the film industry would be solved. This was the idea Portal broached to Rank.

In 1935, when Rank was not yet ready to risk alone the millions necessary for such a venture, assistance came from C. M. Woolf, veteran movie man and organizer of Gaumont-British's theater chain. Together they established General Film Distributors, Ltd., and Rank acquired several small theater circuits and began production on a small scale. Then, in 1936 he created the holding company General Cinema Finance Corporation and increased the scale of his operations. His first big opportunity came when a group of American bankers were seeking a purchaser for a 25 per cent interest at two million dollars in Universal Pictures Corporation stock. Buying through General Cinema Finance Corporation, Rank entered into an agreement whereby he obtained distribution rights to Universal pictures in Britain and production and distribution rights to the newsreel the company had been placing on the British market. Next he was able to buy into the extensive Odeon Theatre Chain, of which he was to get control in 1941. When Gaumont-British ran into financial difficulty, Rank by fiscal maneuvering was able to acquire 5,100 of the 10,000 voting shares of the holding company, the Metropolitan and Bradford Trust, which controlled that organization and its numerous subsidiaries. He "achieved control," notes *Fortune*, "with the assistance of bankers who regarded him as one of the best risks in England for psychological credit" because of his "Methodist rectitude."

Rank was now in control of two of the three major British theater chains, a major producing company and a growing distribution organization. And he set out to complete what he called the "rationalization" of the industry. Having already built a studio at Pinewood, he prevailed upon Alexander Korda and Prudential Assurance to sell him their studio at Denham, the best in England. He also bought from Korda a film and print laboratory near the studio and acquired G.B.-Kalee, Ltd., the purveyor of nearly 90 per cent of British theater and studio equipment. "Rank," comments *Fortune*, "did all this in eight years [1935-43] and at exactly the right time. He bought at the bottom and was in possession at the time of the movies' greatest boom. During the war Britons could spend their money on practically nothing but films, and Arthur Rank's theaters took a little less than a third of all the admissions. Profits were so plentiful that most of them were in danger of being drained away in excess-profits taxes. Rank realized the hour to take the big gamble had struck."

Rank wanted, continues *Fortune*, "to use his theater profits to produce expensive pictures that would really put Britain on the movie map." But he was not to be allowed to do so. Before he could get started on his objective, he ran into opposition in the form of a Cinematograph Films Council monopoly investigation for the Government. In the late spring of 1943 the Trades Union Congress, acting for the cinema industry unions, lodged with the Board of Trade a protest concerning the growing monopoly in the industry. In a letter from Hugh Dalton '45, president of the Board, Rank was told: "The Government, which desires to see the development of a vigorous and successful film industry, and which looks to you to play an important part in achieving this aim, lately has been much concerned at the appearance of certain monopolistic tendencies." The Government would allow him to complete several deals then pending, Dalton continued, but further extensions of his film interests in Britain would not be tolerated. With these directives Rank complied.

As the protests continued, however, the Films Council, an advisory body of the Board of Trade, was delegated to investigate—despite active defense of and commendation for Rank in Parliament, and especially in the House of Lords, for his rehabilitation of and leadership in the industry. The Film Council's report established the existence of monopoly not solely by Rank but by Rank and his largest rival, Associated British Pictures. Of Britain's 5,000 cinemas, observers pointed out, 2,000 are first-run, and only 600 of these were under Rank's control. Of the 30 production stages active in early 1945, only 15 were Rank-owned. Thus, they noted, 1,400 first-run houses and 15 active production stages did not belong to Rank. But if the Associated British Pictures holdings were included in the total, only 950 first-run theaters, including only one-third of their number in the remunerative London area, and only 10 active production stages were found to be independent, thus indicating, in the words of one critic, "an almost complete stranglehold" by the two combines. No action was taken against Rank, however, first, because there is no statutory provision for the prevention of monopoly, and, secondly, because the beneficial effect of a strong competitor against Hollywood was recognized.

The agitation about monopoly having lessened, Rank turned once more toward expansion in a world market. While the British film industry had been considerably rehabilitated through the efforts of Rank, the original problem of enlarging the British market for British films and of securing global sales remained. (Statistics show that American producers earned eighty-three million dollars in Britain in 1944.) In June 1945, therefore, the producer made a business trip to the United States, on which he was royally feted by Hollywood moguls. His aims were to study Hollywood movie-making technique, to initiate or complete negotiations with Hollywood producers which might prevent the reoccurrence of such releasing troubles as he had had with Twentieth Century-Fox on *The Way Ahead*, and to determine the reasons for the limited appeal of English movies for American audiences, a problem which he had already been investigating by means of judi-

RANK, J. ARTHUR—*Continued*

cious questioning of GI's in England and through the agency of special investigaters mingling with American movie audiences. Before he returned to England Rank had arranged for the interchange of stars and technicians between England and the United States, had formed a company with David O. Selznick '41—Selznick International Pictures of England, Ltd.—"for the joint production of super-colossal features in Britain," had made a similar arrangement with RKO, and had agreed to finance the leasing of New York's Winter Garden by United Artists as a showcase for Rank pictures. (The first picture to be shown in the theater was the film Adaptation of Noel Coward's '41 *Blithe Spirit,* photographed, as the advertisements proclaimed, in "blushing Technicolor.") Earlier, Rank had set up Eagle-Lion Films, Inc., as an American distributing, and ultimately producing, unit for his films. He had also bought a half-interest in Odeon Theatres of Canada, Ltd., and was believed to have made advantageous deals in both Russia and France.

Rank realized that his only hope was to produce films of such quality that American exhibitors would wish to present them. He believes that quality counts in film making and that adult pictures will sell. "Your people have a low opinion of the American public," he told Hollywood skeptics on his American visit. "I don't. I think if Shakespeare is done properly, they'll like it." Despite the American box-office failure of *Colonel Blimp* (1945) and *Mr. Emmanuel* (1945), he is confident that his *Henry V* (costing $2,000,000) and *Caesar and Cleopatra* (costing $5,000,000—to *Gone With the Wind*'s $3,800,000) will make money in the United States. But he also realized that he would have to glamorize British stars and to key both material and method to American audiences, as he had done in *Way to the Stars,* in order to accomplish his objective. As to a possible film war between Britain and the United States, Rank said: "Our growing up does not create a conflict between the American and British film industries. Rather it creates a most healthy condition of fair competition, good for all concerned—and the best films will attract the widest audiences when they are given an opportunity to be exhibited. All we ask is that, if our films are entertaining enough and good enough, a fair proportion of the audiences of the world shall be given a chance to see them. Where Britain's films are given a chance to be tested at the box office, they usually stand the public test well and will do better and better as we progress." To a colleague in England he wrote while in the United States: "In my heart I have a great desire to cooperate with our American friends. I believe we can give more to the world if we work together than if we each go our own way. Whatever rebuffs I get I shall stick to this policy and return to the charge again and again."

In his latest move to achieve wider world circulation for British films, Rank, in November 1945, established United World Pictures Company in association with Universal Pictures Corporation and International Pictures, both of Hollywood. Forming a second unit for the reciprocal distribution of British and American motion pictures three weeks later, Rank joined with Pathé Industries, Inc., in the organization of Eagle Lion Films, which will become operative in September 1946.

A normal working day for Rank, whose business interests also include such companies as the B.I. Transport Company, Ltd., Sunbeam Milk Bars, Ltd., and Methodist Newspapers, Ltd., begins at 8:30 A.M. and rarely ends before one or two o'clock the next morning. "He works," writes Francis Sill Wickware in *Life,* "even while being driven from office to office and has the door open and is ready to leap out while the car is still moving. . . . [He] keeps the details of his enterprises under close personal scrutiny and does not delegate much to others. . . .His 'office' consists mainly of four heavy brief cases which he carries with him wherever he goes. Somehow he can find immediately any paper he wants, even though the documents in the brief cases pertain to the intricate affairs of no fewer than sixty different companies." Rank made himself equally at home in "fairyland" Hollywood and grain center Minneapolis. At Hollywood parties, as a teetotaler, he drank fruit juices or ginger ale—in addition to his tea. *Life* tells that he kept his watch on British time while in the film colony. Rank was married to the Honorable Laura Ellen Marshall, daughter of Lord Marshall of Chipstead, in 1917. The couple have two daughters; Ursula and Shelagh. They own, in addition to their Reigate home, a fifteen-thousand-acre estate, Sutton Manor, in Hampshire, where Rank has constructed an intricate practice golf course. His recreations are golfing and shooting. He is a powerfully built man, six feet tall, weighing 184 pounds, with brown eyes and black hair. Said one observer: "His shrewd brown eyes are set close to a long, hawklike nose, and his forehead is ridged with wrinkles that come from intensive scrutiny of the motives and maneuverability of men."

RAWLINGS, SIR (HENRY) BERNARD (HUGHES) May 21, 1889- British naval officer

Address: b. c/o British Admiralty, London; h. Lancarffe, Bodmin, England

At the time of the surrender of Japan in August 1945, Vice-Admiral Sir Bernard Rawlings was in command of the carrier force which bombarded Japan, second in command under Admiral Sir Bruce Fraser '43, commander in chief of the British Pacific Naval Forces. In at the kill, Rawlings' units were supporting the larger American fleets in the Allied attacks on the Japanese mainland. Sir Bernard has been in the Royal Navy for more than forty years, and has seen service in all parts of the world. He spent three years in Tokyo itself as naval attaché, and he is determined, he says, to destroy the Japanese military caste and see it discredited in the eyes of the Japanese.

The son of W. J. Rawlings, Henry Bernard Hughes Rawlings (always called "Bernard" to avoid confusion with Rear Admiral Henry Clive Rawlings, his older cousin) was born in Hayle, Cornwall, on May 21, 1889. He went to school at Stanmore Park, and at the age of fifteen entered the Navy as a cadet in the H.M.S. *Britannia*. He was graduated as a torpedo officer, and received his first assignment as a lieutenant two months after the outbreak of the First World War. From August 1915 to April 1917 he was in the *Antrim*, and until the end of the war, nineteen months later, he carried out paravane and torpedo duties on the H.M.S. *Undaunted* and *Coventry*, with the Harwich Force. (A paravane is a safety device against moored mines.) One month after the Armistice Rawlings, then a liteutenant commander, was assigned to accompany a mission to Poland. In 1919 he was appointed naval liaison officer to the British military mission at Warsaw, at which post he remained for three years, receiving the Order of the British Empire in 1920 in recognition of his services there.

The year 1922 found Rawlings as torpedo officer in the *Diomede*. Then he became an instructor in H.M.S. *Vernon*, the torpedo school at Portsmouth, took the staff course at Greenwich, and in 1927 was back again as fleet torpedo officer in the *Revenge*. Rawlings received a promotion to captain three years later, when he was forty-one, and was given the commands, successively, of the *Curacao*, *Active*, and the *Delhi*, after completing a senior officers' tactical course. In 1935 Captain Rawlings was graduated from the Imperial Defence College, where he had received advanced training, and was sent to Japan as naval attaché in the British Embassy in Tokyo. The officer was in Japan during the years from 1936 to 1939, crucial ones both in Europe and the Far East. It was during Rawlings' service in Tokyo that the Japanese captured Shanghai, Nanking, Hankow, and Canton. The capture of these cities greatly affected British sentiment towards Japan, for England had large commercial interests particularly in Canton and Shanghai.

Rawlings returned to England in March 1939, and in August of the same year, just before the outbreak of the Second World War, he was put in command of the battleship *Valiant*. When France fell in the summer of 1940 many ships were ordered to the Mediterranean in order to strengthen Britain's position in those strategic waters, and among them was the *Valiant*. In company with the aircraft carrier *Illustrious* and two cruisers, she was sent to Alexandria. In that same year Rawlings, who had already been mentioned in dispatches for "successful operations against the enemy," was promoted to rear admiral, and was assigned to the command of the First Battle Squadron. In 1941 his squadron engaged the Italians at Matapan and sunk five ships of the Italian Fleet and damaged others at a cost of only one British aircraft.

In the spring he was given command of the Seventh Cruiser Squadron. With the *Warspite*, and the *Valiant*, Rawlings lay off the west coast of Crete, the rumor of his presence keeping the Italians out of those waters. A week later, when the German air force had invaded the island, Admiral Rawlings was called upon to evacuate the Heraklion garrison. He accomplished this mission, but not without encountering serious difficulties: One destroyer was lost and another crippled; the captain of the *Orion*, Rawlings' flagship, was killed, and the Admiral himself was wounded. In this action Rawlings made manifest his "fearless judgment and gallant bearing," and it was said that he extricated his squadron with great determination in the face of the gravest dangers. Later in January 1942 he was made a Companion of the Bath "for gallantry, leadership, and skill during the Battle of Crete." When he recovered from his injuries Rawlings resumed command of the Seventh Cruiser Squadron, which consisted now of only two cruisers, and took part with the addition of two destroyers in the defense of Malta by blowing up an ammunition ship in the face of superior Italian forces, and sinking a destroyer and tanker, all in one day.

VICE-ADM. SIR BERNARD RAWLINGS

In March 1942 the Admiral returned home to receive an Admiralty appointment, serving in England for one year as Assistant Chief of Naval Staff. But in 1943 Rawlings, now acting vice-admiral, was back again in active service, this time as flag officer in West Africa during the Tunisian campaign. In November of the same year he received his promotion to vice-admiral, and two months later it became known that Vice-Admiral Rawlings was back in the Eastern Mediterranean, with a force of cruisers, carriers, submarines, flotillas of mine sweepers, and coastal craft, as well as a contingent of the Greek Navy, and French and Polish vessels. He supervised the harassing of German ships and transports, and the routing of them from that area. Shortly after that Rawlings was relieved of his Mediterranean command, knighted by King George VI '42, and then given another command at sea.

It was in March 1945 that the first reports of joint British-American action in the Pacific

RAWLINGS, SIR BERNARD—*Cont.*

were received in dispatches on the battle of the Ryukyu Islands. Admiral Nimitz issued a communique to the effect that British forces had destroyed twenty enemy aircraft on the ground, shattered one coastal vessel and wrecked several others, and had left the town of Ohama in flames. It was reported that at the beginning of the Allied attack on the Ryukyu Islands (directed by an American, Admiral Raymond A. Spruance '44) Commodore Worrall R. Carter of the United States Navy sent the English flagship this message, blinked from his ship: "Good hunting, good luck, and Godspeed to you, British brothers." And Rawlings made the reply, "Thank you very much. I hope we meet again, Commodore—nearer Tokyo."

By July 17 Admiral Rawlings and the British task force were nearer Tokyo, together with the American Third Fleet under the command of Admiral William F. Halsey '42. In fact, the combined British and American fleet was so near to the general area of Tokyo that they were able to shatter it with shells. In these midsummer battles in the Pacific, the British naval forces showed themselves to be highly adaptable to changed circumstances, for they had to depart from century-old tactics and adopt new ones. For years the British Navy had fought from bases spaced no more than a thousand miles apart, but in the Ryukyu Islands battles it had to operate from the nearest British base in Australia, four thousand miles away. These new tactics have made obligatory the use of a fleet train, an American invention, a kind of floating naval base. A dispatch to the New York *Times* on April 19, 1945, reported that the British sea forces had shown a finer grasp of long-range fighting in every new operation in which they participated.

The British force under Sir Bernard included the 35,000-ton battleship *King George V*, the 23,000-ton carrier, *Formidable*, two cruisers, and five destroyers. This British force accompanied the American Third Fleet when Admiral Halsey began his attack on the Japanese mainland, steaming within ten miles of the coast of Honshu, northeast of Tokyo, under a black and heavily overcast sky. (The British attack was the first strike against the Japanese homeland, in retaliation for the Japanese sinking of the *Repulse* and the *Prince of Wales* off Singapore early in the Pacific war, in December 1941.) These history-making attacks led by Admiral Halsey resulted for the Japanese in the loss of 1,278 airplanes destroyed or damaged, and a total of 1,035 Japanese surface craft sunk in the Honshu waters, according to the announcement of Admiral Nimitz on August 1, 1945. The Allied forces also succeeded in shelling and bombing industrial centers in the Tokyo area, but perhaps even more important, British-American cooperation was said to be something of a psychological blow to the Japanese, who had hoped to benefit from any British-American disunity.

Sir Bernard Rawlings is said to possess the stout courage and ready judgment of the warrior, and a gift for friendliness in his relations with the men of his ships. Off duty he is known as "a first-class international mixer." The Admiral's own personal postwar plans are to return to his family, at least for a time; his wife, Eva Loveday, to whom he was married in 1922, and their three children, two sons and a daughter, await him in their home in Lancarffe, Bodmin, where Sir Bernard has been accustomed to enjoy his favorite recreations of fishing and gardening. In September 1945, as if to mark the official surrender of Japan, Vice-Admiral Rawlings became a Knight of the British Empire in recognition of his services in command of the British task force.

RAY, (JACKSON HARVELLE) RANDOLPH, REV. June 11, 1886- Clergyman

Address: Church of the Transfiguration, 1 E. 29th St., New York City

Rector for the past twenty-three years of New York's Episcopal Church of the Transfiguration, more popularly called the Little Church Around the Corner, is the Reverend Dr. Randolph Ray, who is also known as an author and lecturer.

Jackson Harvelle Randolph Ray was born June 11, 1886 in Madison County, Mississippi, the son of Jackson H. Ray and of the former Alice More Spottswood Tidwell. On his father's side he is a descendant of Sir Christopher Wray, Lord Chief Justice in Queen Elizabeth's reign, and of William Wray, who came to America at the time of the Restoration of Charles II. Through his mother his most famous American antecedent is Governor Alexander Spottswood of Virginia. Randolph's father, a veteran of the Confederate Army, was a gentleman farmer, owner of a cotton plantation. Young Randolph received his early education at private schools and through governesses. His mother, a devout person, encouraged the boy's study of religion, hoping that he might some day enter the clergy. One of Randolph's childhood delights was to put on a white apron and preach to the fowl in their coops.

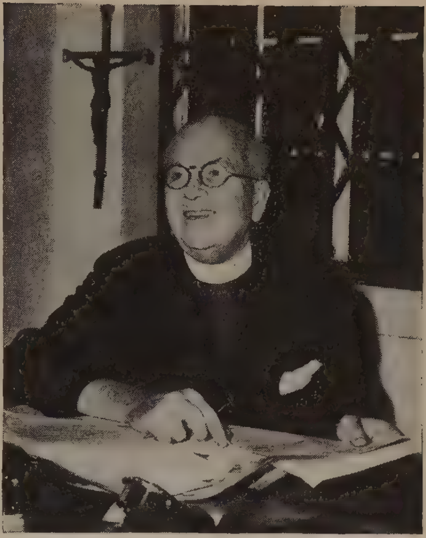
In 1905 young Ray received his B.A. from Emory and Henry College, Virginia, and came to New York intending to study medicine at Columbia University. According to Dr. Ray, his brief inspection of the various laboratories on his first day at medical school was enough, and he turned almost immediately to the study of law. After a year (1906) at law school journalism attracted him. He therefore abandoned law to take post graduate work in English at Columbia University. While at Columbia, the late Dr. Brander Matthews of the English Department was enough impressed with Ray's writing ability to introduce him to Frank Andrew Munsey, then publisher of several magazines and owner of the New York *Evening Sun* and *Evening Telegram*. Ray wrote articles for Munsey's publications as well as thrillers for the pulp magazines while at Columbia, but devoted the major part of his time to writing for and editing trade magazines. He also worked briefly as a reporter for the Brooklyn *Eagle*.

Ray's vocational experiments had apparently not been satisfactory. In 1908 the once aspiring doctor-lawyer-writer entered the General Theological Seminary in New York City. Three years later he was ordained deacon, and a year later priest of the Protestant Episcopal Church. From 1911 to 1914 he was curate of the Church of Zion and St. Timothy in New York; then he assumed the rectorship of St. Andrew's Church in Bryan, Texas, and was at the same time chaplain at the near-by Texas Agricultural and Mechanical College. Rejected by the Red Cross for services overseas during the First World War, he became dean at St. Matthew's Cathedral in Dallas, Texas, and civilian chaplain at an adjacent air-force station. In April, 1923, he became rector of the Church of the Transfiguration, The Little Church Around the Corner, in New York City.

The Church of the Transfiguration, founded in 1848, was built at 29th Street and Fifth Avenue— a section of New York City then referred to as Lovers' Lane. Its founder and first rector, Dr. George Hendric Houghton, has been described as the First Saint of the American Episcopal Church. A supporter of the most conservative viewpoints, Dr. Houghton was also an upholder of unconventional action "when he believed it to be right." Under Dr. Houghton's pastorate the church gained a reputation for kindly, liberal acts. It first broke with conservative tradition during the last year of the Civil War when it offered refuge to Negroes.

In 1870, paradoxically for the church that was to become known for weddings, the funeral of an actor made it famous. The widow of the well known English actor, George Holland, sought with the help of Joseph Jefferson to have her husband buried from a church on near-by Madison Avenue. The minister of that church said it would be impossible to hold services for an actor, but suggested that they go to the "little church around the corner." Jefferson's explanation to Dr. Houghton of the Church of the Transfiguration brought the reply: "I only know that your friend is dead and my services are asked. That is quite enough." Since that day the influx of theatrical folk as parishioners has increased steadily. Actors were the first to make it popular as a church from which to be married, and today the church contains memorial windows to such actors as Joseph Jefferson, Edwin Booth, John Drew, and Richard Mansfield. The once tiny edifice is now a small cathedral with world-wide fame. Says Dr. Ray: "First the brides came from New York City and its vicinity; then from the Middle West and Far West; later from Europe and the distant corners of the earth. Continuously, children and grandchildren of people married in this church come here to be married."

More than a hundred thousand bridal couples have been married in the church during its ninety-five years of existence. Yet the church is not a Gretna Green, in the sense that couples can be married there easily, at a moment's notice. In the words of Dr. Ray, "Because the Little Church was started under the influence of the Oxford Revival, it adopted the Catholic idea of marriage. The sacramental aspect was emphasized; the bridal couple must not be divorced, they must be baptized, they must enter upon their marriage with the understanding that it is to be for life." Because of these tenets, the church has had to refuse marrying approximately five hundred couples each year. As a young curate, Dr. Ray observed that the wedding service was often badly read. He therefore studied diction with the veteran actor Philip Ben Greet to improve his delivery of the marriage lines. In his twenty-two years of rectorship at the Church of the Transfiguration, he has approved the holding of fifty thousand weddings and has performed more than half of them himself. Although weddings play such a vital role in the work of the church, other services are not neglected. The sick are visited and the needy looked after. In the depths of the depression the church fed seventy-five thousand unemployed in the course of a few weeks.



REV. RANDOLPH RAY

Dr. Ray's *Marriage Is a Serious Business*, published early in 1944, is in the opinion of the *Churchman* "helpful to the clergy who perform marriages, to the young people who contemplate them, to the mothers who wish to manage them, and even to those who are already married. The book is full of wise advice, kindly humor, deep insight." The clergyman is basically opposed to wartime marriages because a couple are not apt to know each other very well. Before he performs a marriage he poses four questions to the couple: (1) Do you really know each other? (2) Have you similar backgrounds and interests? (3) Are you both really in love? (4) Does the girl realize that when her husband returns home he may be a stranger to her? Dr. Ray urges a war bride not to follow her husband to his various posts, but to set up a home of her own, to keep in touch with her husband's family, and to live within the bounds of her husband's financial scale. He also advises her to keep busy; "to try to grow in understanding with her husband even though he is away, and to cultivate faith in God and in each other."

The rector feels that romance is the best assurance for a happy marriage. His familiar bit of advice to newlyweds is: "Now don't both get mad at the same time." According to Dr. Ray a successful marriage requires as much concentration as a career. Marriage is not, in his opinion, a part-time job, but one that

RAY, REV. RANDOLPH—*Continued*

requires maximum effort throughout one's life. Says the rector of The Little Church Around the Corner: "Marriage is the rock on which our civilization is founded. . . .It has floundered and gone down not on big obstacles but, for the most part, on little ones. And yet there is no one who cannot, if he will, solve the little things. Happiness is in reach and we let it go for an absurd triviality, for a selfish impulse, from an inability to recognize it when we see it." *Marriage Is a Serious Business* has been listed as prescribed reading for social relations courses at Vassar College.

With men returning from overseas to begin anew their civilian and family lives, Dr. Ray feels that "marriage is still a serious business." But he has added three words: "So is divorce." Referring to the tremendous rise in divorce statistics after the war's end, he cautioned young couples to take time to think things over before making the final decision. "Give yourselves time to get reacquainted. . . .Try a second courtship if you feel like strangers. . . . Forget your hurts, your fears, and cooperate toward rescuing your marriage. . . .Only with patience, tolerance, and understanding from both sides will you succeed in re-establishing a good relationship," is his parting advice to young people seeking his help.

Dr. Ray believes the war has given the clergy a wider understanding of the needs of mankind. He believes, too, that "the human being must cultivate himself today precisely because war has a tendency to take human life cheaply and make it seem of slight importance. In wartime we must find God somewhere, and religion must rally people to the old standards and help them keep up their morale." The rector feels the hope of the world lies in the breaking down of prejudices and in the practice of the simple teachings of religion in everyday life. On Armistice Day in 1942 Dr. Ray dedicated the church's Victory Shrine, before which daily prayers are held for victory and peace on behalf of six thousand servicemen who have visited it. Celebrating the end of hostilities with the Japanese, Dr. Ray said in the V-J sermon on September 2, 1945, that peace cannot be imposed by laws, by treaties, or by "the immemorial methods which resort to the sword. We can no longer depend on the means of warfare to defend our inalienable rights. We have come to our last chance and the knowledge that the world's only resort is brotherhood in the sense of these things in which we are alike and in which we have a common interest."

The rector of the Little Church Around the Corner has told of his interest in astrology and the theater. For many years he was a close friend of Evangeline Adams, the astrologer, and he recalls her prediction that he would some day be rector of the Little Church. His interest in the theater resulted in his establishing the Dallas Little Theatre in the deanery of St. Matthew's Cathedral, and later in his founding of the Episcopal Actors Guild at the New York church. He is an officer of the Guild, and a member of the Lambs and the Players clubs. The clergyman declares that, contrary to general opinion, the actor is "incurably religious" since the artist is inherently spiritual. In his many years of contact with people of the theater, he has found most of them applying their faith not only in religious and moral problems but also in their profession. He urges ministers to become affiliated with the different actors' guilds to increase mutual interest between the clergy and members of the theatrical profession. That the rector has helped carry out this self-imposed task is indicated by the words of Frank Gillmore, president of the Association of Actors and Artists of America: "It is here that we actors have been married, have christened our babies and buried our dead—the church that Joe Jefferson made ours when he gave it the most caressing and gentle nickname, the Little Church Around the Corner." To preserve the Little Church on 29th Street has, of course, been one of the rector's important concerns. With the constant leveling of buildings and new construction in the neighborhood, he felt that nothing would save the structure except human sentiment. "Money alone will not do it," he said in 1930 when he organized the "Family of the Little Church Around the Corner." "I am attempting to organize this sentiment for the purpose of perpetuating this church as a national shrine for generations to come as a medium of God's love to men." Some 40,000 persons keep in touch with Dr. Ray and the church by mail and personal contact, even when their church attendance is irregular.

Dr. Ray received the D.D. degree from the University of the South in 1925, and he was a member of the General Conventions of the Protestant Episcopal Church in Detroit (1919), Portland (Oregon) in 1922, Kansas City since 1940, and Cleveland (1943). The rector is a tall, dignified man with an ingratiating smile. Golf and gardening are his favorite means of relaxation. In July 1922 he was married to Mary Elmendorf Watson, a descendant of the Van Cortlandt, Schuyler and Livingston families and of Edward Winslow, early governor of the Plymouth colony. Her death in 1939 was a great loss to Dr. Ray, who describes his late wife as a woman "of beauty, intelligence and poise." His only child, Kathryna Hoffman, was married in 1944 to Lieutenant Courtlandt Nicoll, also a descendant of old New York families. Dr. Ray hopes to write an article on the influence of the three women in his life—his mother, his wife and his daughter.

RECKORD, MILTON A(TCHISON)
Dec. 28, 1879- United States Army officer

Address: c/o War Department, Washington. D.C.

Provost Marshal General of the United States Army Forces in the European theater of operations—the chief of the military police units—was Major General Milton A. Reckord. Born December 28, 1879, in Harford County, Maryland, Milton Atchison Reckord entered upon his military career shortly after his twenty-second birthday, when he enlisted on

February 15, 1901, in Company D of the First Infantry of the Maryland National Guard. His aptitude for soldiering was soon recognized: on December 28, 1903, he was appointed captain in the Infantry, Maryland National Guard, after serving as private and first sergeant. In another three years he was promoted to major, on September 27, 1906; and on June 28, 1916, in the same rank, he was mustered into Federal service, serving on the Mexican border with the First Infantry, National Guard, until November 4, 1916.

When the United States entered the First World War not many months after the Mexican expedition, Major Reckord was again called into service for duty with the First Infantry, Maryland National Guard, on May 29, 1917. He was immediately assigned as a student to the School of Fire, Fort Sill, Oklahoma, where he stayed from May until August of that year. Promoted to lieutenant colonel on August 5, 1917, he was transferred to the Fifth Infantry of the National Guard. Soon thereafter that unit was renumbered the 115th Infantry, Twenty-ninth Division, and was stationed at Fort McClellan, Alabama. Reckord was next assigned to the Brigade and Field Officers School at Fort Sam Houston, Texas. After his graduation, he received his promotion to colonel on May 1, 1918, when he assumed command of the 115th Infantry.

The following month Colonel Reckord and his unit sailed for France with the American Expeditionary Forces, where they participated in the action north of Verdun. For his part in this battle Colonel Reckord was awarded the Distinguished Service Medal as well as the French Croix de Guerre with Palm. His citation for the D.S.M. read in part: "Inspiring his men by his aggressive spirit and fervent devotion to his task, he led them with noted success through three weeks of constant action against the enemy." After the Verdun engagement Reckord attended the Line Officers School at Longeau, France, and, upon the completion of the course, he was assigned to command the Fifty-seventh Infantry Brigade. The brigade, after defending the Center Sector (in Alsace) under Colonel Reckord, took part in the Meuse-Argonne offensive, America's greatest battle of the war.

Honorably discharged on June 26, 1919, a month after returning to the United States, Reckord continued his military service with the Officers Reserve Corps, accepting an appointment as colonel in the Infantry on September 1, 1919. During the peacetime years he served in several important posts with the Maryland National Guard. The first of these was as Adjutant General of the State of Maryland in March 1920, followed by three periods of active duty with the War Department General Staff during the years from 1920 to 1924. Appointed a colonel, Adjutant General's Department, Maryland National Guard, on April 30, 1921, Reckord was promoted to brigadier general three months later. After this promotion and service with the War Department General Staff, on March 21, 1924, he was reappointed from the Adjutant General's Department to the rank of brigadier general of the line, and on the same day he assumed command of the Fifty-eighth Infantry Brigade of the Maryland National Guard. During that year and in 1925 he also served as president of the National Guard Association.

U. S. Army Signal Corps
MAJ. GEN. MILTON A. RECKORD

On April 14, 1934, he was promoted to major general in the National Guard of the United States and assumed command of the Twenty-ninth Division, serving in this capacity through the induction of the division into Federal service on February 3, 1941, until January, 1942, when he was transferred to the headquarters of the Third Corps Area, in Baltimore. The following May he was assigned as commanding general of the Third Corps Area (redesignated Third Service Command), and served with distinction in that post until December 1943. For his ability in reorganizing the Third Service Command, he was awarded the Oak Leaf Cluster to the Distinguished Service Medal in 1944.

In December 1943 General Reckord was ordered to duty in the European theater as Provost Marshal General. In this position the General is responsible for criminal investigation activities, custody and disposition of offenders, as well as duties relating to prisoners of war, stragglers and deserters, traffic control, policing and supervision of civilians in combat areas, and the over-all command of military police units in his theater of operations. At the time of his appointment Reckord was concerned with the discipline, morale, and protection of the American soldiers waiting in England for the imminent invasion of France. His interest was to aid rather than hinder the American soldier in his search for excitement while on furlough. "For in this war," he wrote in *This Week*, June 25, 1944, "the MP isn't so much a cop as a cross between an information bureau and a nurse. We have even put them in white helmets, white leggings, and white gloves, so it will be easier for the men to find them." To the soldiers of the First World War, this is a far cry from the "Who won the war?" wisecrack so freely used then in referring to the MP's.

(Continued next page)

RECKORD, MILTON A.—*Continued*

Once the invasion began the Office of the Provost Marshal was burdened with expected, but fast multiplying, duties. Soldiers lost from their units in the confusion of battle had to be routed through prepared straggler lines. "AWOL's" and deserters apprehended in the rear areas were returned to their units for punishment or confinement. At one time their number was estimated at eighteen thousand, but this number was cut to eight thousand when General Reckord showed that the original figure had been arrived at by adding six hundred to the total each day without deducting the number of men who had been returned to their outfits. Nor were these the only snarls that had to be untangled. Soon after the freeing of Paris in August 1944, the headquarters of the Provost Marshal were moved to that city and the staff immediately set about controlling traffic through the bicycle jams and narrow streets. Supplies to the front were routed through with utmost speed despite the Parisians who, having been used to automobile-free streets, became a hazard to the American and British drivers.

At the end of 1944 the cigarette shortage on both the battlefront in Europe and the home front in the United States reached headline proportions—a shortage which was discovered in part to be due to black market operations among American soldiers in France. In November 1944 General Reckord detailed over one hundred undercover agents to specific areas throughout France. Through these efforts the first arrests were made simultaneously at sixteen places between Cherbourg and Paris on November 27. Two officers and two hundred enlisted men who were arrested by the Army confessed receiving more than two hundred thousand dollars from the sale of stolen American cigarettes in the black market. Courts-martial sentences of those proven guilty ranged from a few months to as much as thirty years.

The duties of the Provost Marshal include supervision of prisoners of war. During the victorious campaigns in France and Germany, when great numbers of prisoners were taken, they were housed and fed as were the American troops in base areas in accordance with the Geneva Convention, and "also in the hope that the hardships of American prisoners in Germany might be eased as a result." The maintenance of order and the distribution of food among civilians in liberated areas were also the tasks of the Provost Marshal until the Allied Military Government was established and had taken over. The rehabilitation of liberated Allied prisoners of war was another responsibility of General Reckord.

RENNER, KARL (rĕn′ĕr kärl) Dec. 14, 1870- President of Austria

Address: Vienna

Karl Renner, President of the newly liberated Austrian state, has been a leading figure at the several key points of his country's history over the last thirty-odd years. Born three years after the *Ausgleich* which established the Dual Monarchy, he was the first Chancellor of the Austrian Republic and signer for defeated Austria of the treaty of 1919 which made her a small, powerless state. Later he was one of the Socialist leaders who was jailed in early 1934, when events foreshadowed Austria's annexation by Nazi Germany; he became the first Chancellor of the Provisional Government set up after her liberation, and in December 1945 was elected President of Austria.

The son of peasants, Matthias and Marie (Habiger) Renner, Karl Renner was born in Dolní-Dunajovice, Moravia, on December 14, 1870. He studied law at the University of Vienna, where he was introduced to Neo-Marxist thought, and before his graduation with an LL.D. he became a Social Democrat and leader of the Neo-Marxist movement. (The Neo-Marxists sought to make Marxian socialism evolutionary rather than revolutionary.) In 1907 he was elected a deputy to the National Assembly, and, as a leader of the Social Democrats, he was in the vanguard of the opposition to the Hapsburg monarchy. The Government was notorious for suppression of its heterogeneous minority groups, and in the years leading up to the outbreak of the First World War the spirit of nationalism within the empire became very strong. Renner himself is the author of *Das Selbstbestimmungrsrecht der Nationen* ("The Nations' Right to Self-determination"), published in 1918.

This rising and disruptive nationalism in Austria-Hungary was an expression of the feeling prevalent throughout the whole of Europe on the eve of the war. It was particularly strong among the Serbs, Croats and Slovenes—known collectively as the Yugoslavs—within and without the empire. Consequently, when the Dual Monarchy acquired the predominantly Croatian and Serbian provinces of Bosnia and Herzegovina in 1908, the nationalistic fervor of the Serbian Yugoslavs exploded, setting off a series of events that eventually led to the assassination in 1914 of the Archduke Francis Ferdinand, the heir to the Hapsburg throne. In a tense Europe, where the "engrained competitive nationalism [of the great powers] proved to be stronger than the more recently awakened ideal of international conciliation," this event was only the last of the crises that plunged the world into war, and ended in the dissolution of the Austro-Hungarian empire.

The end of Austria-Hungary as a unit came on November 12, 1918, when German Austria was proclaimed a republic and a temporary Cabinet formed with Renner as its head. Attempts were made by Communists to bring Austria into the ranks of the Soviet republics, but Renner thwarted all demands of the Communists made with the object of overthrowing the Provincial Government. In the first republican elections, in February 1919, the Social Democrats won the largest representation in the new National Constitutional Assembly, and Renner, the moderate Socialist, became the first State Chancellor of the Austrian Republic, in a coalition Government composed predominantly of Social Democrats and the conservative Christian Socialists. That summer the Chancellor went to Paris to accept Allied peace terms, and when Foreign Minister Otto Bauer resigned rather than accept certain provisions of the treaty, Renner took over his portfolio. In September, as head of the Austrian delegation, he therefore signed the Treaty of St. Germain with the victorious Allied powers. A second coalition Government was formed the next month, in which Renner retained both the Chancellorship and the Foreign Affairs portfolio. When the coalition was dissolved the following June he remained as Foreign Minister, until his resignation that October.

The establishment of a republic was, however, not to be the solution to Austria's postwar economic and social problems. Under the terms of the Treaty of St. Germain she had been forced to recognize Czechoslovakia, Yugoslavia, and Poland as independent states, and to cede to them and to other states large portions of her land. As a result, she was deprived of three-fourths of her territory and people, and reduced to a small landlocked state. This left the country without sufficient food and raw materials, and trade was cut off by the tariff barriers erected at the end of the war by the succession states of central Europe. To many Austrians at this time, including the Social Democrats, the only way out of this situation was *Anschluss* or union with Germany, a move forbidden by the terms of the treaty and vigorously opposed by the Allies and by the monarchists and clericals within Austria itself. Renner, a member of the National Assembly in 1922 (president from 1931 to 1933), was one of those who supported the union. "Of course we all know," he said, "that as things are now, Austria has no future. We can keep ourselves alive just until the hour of liberation strikes, that is, until we as Germans can decide in favor of the state to which we belong by the nature of things."

The League of Nations, by arranging for loans and supplying financial supervision, came to the aid of the young Republic in the early twenties, and again at the time of the world depression; notwithstanding, a desire for union with Germany remained. With the rise of Hitler '42, however, the *Anschluss* question developed complications, for *Anschluss* now meant union with a Nazified Germany. A subdivision of Hitler's National Socialist Party was established in Austria, and a concerted effort was made by the Nazis to bring about annexation by Germany. Nazism spread rapidly among the conservatives in Austria, and Dollfuss decided to rule by decree in order to maintain the country's independence.

Meanwhile, Austria was disturbed as well by the antagonism between the radical urban proletariat and the conservative rural classes, represented, respectively, by Renner's Social Democrats and the Christian Socialists. (In Vienna, where the Social Democrats were strong—after 1919 they never again gained a majority in the National Government—the city passed legislation providing for social welfare, public health, housing, education, recreation, and city improvements.) The result of this hostility was the formation of two militant organizations, the Schutzbund of the Socialist workers, now opponents of the *Anschluss* movement, and the Heimwehr of the peasants, described as "a type of Fascist organization, strongly anti-Socialist." In February 1934 Dollfuss, seeking the aid of these Austrian Fascists and Mussolini '42 against Germany, began raiding Social Democratic headquarters—the price of Fascist support. When leaders of the party (among them Julius Deutsch '44) declared a strike, it was put down with accompanying bloodshed by the Army. In the end the party was outlawed and Renner and other leaders jailed. Renner was released the following June, however, there being insufficient evidence to hold him.

KARL RENNER

Shortly after the suppression of the liberal elements in the country, Austria, by a new constitution, became an authoritarian corporate state like Italy, and universal suffrage was abolished. In July the Nazis made an abortive attempt at a coup d'état that ended with the assassination of Dollfuss. During the next four years Austria, under Chancellor Schuschnigg, became merely an appendage of Germany. On March 13, 1938, this relationship was made official; Austria no longer existed as a nation. Earlier in the month, when there was a faint chance that there might be a plebiscite on the question of *Anschluss*, Renner made this statement: "As a Socialist and as an adherent to the principle of self-determination of nations. . . .I will vote 'Yes.'" Whether this was delivered under pressure is not known.

After Austria's extinction as a state, those democratic forces who did not leave the coun-

RENNER, KARL—*Continued*

try went underground. Renner, too, it is reported by Selwyn James in *PM*, is believed to have worked in the underground movement during the war. Shortly after the Red Army reached Vienna in April 1945 Moscow announced the formation of a Provisional Government headed by the seventy-four-year-old Renner, and consisting of Social Democrats, Communists, and People's Party and nonparty representatives. This government, wrote Ernst Karl Winter, an Austrian political refugee, for the *Nation*, is the kind of government political realists have wanted for Austria since 1930. Renner's Government (Renner himself is anti-Communistic and anti-Soviet) has been recognized by the Soviet Government, but has still to be officially authorized by the British and American governments through their representatives on the Allied Control Council for Austria. In the meantime, it is faced with the problem of feeding a starving population and providing fuel for the winter.

In September the issue of Allied recognition of the Austrian and other provisional governments in Europe was placed before the meeting of the Big Five Foreign Ministers in London. The question seemed to be one of "British-American anxiety over the spread of Communism and Russia's insistence that governments of neighboring states must be friendly to her for security reasons if nothing else." In the case of Austria, it was felt that Renner's Government was more representative of radical Vienna than of the whole of Austria, a condition, according to the Chancellor, that was due to the fact that all of the country had not been liberated when the Government was formed. (Of fourteen Ministers, three were Communists.) In a letter to the *Times* of London, Renner pointed out that Austria had turned for guidance to the League of Nations in 1920, to Rome in 1934, and to Berlin in 1938. Now, he concluded, Austria was turning, not to Moscow, but to the United Nations organization and nothing else. "I hope," he wrote, "to have succeeded in having at least explained that the guaranty for Austria's existence and her future does not rest solely, nor even in the first instance, with the people of her soil, but that it rests, to a higher degree, with the world outside."

Delegates from Austria's nine provinces met in Vienna on September 24, 1945, for the first time since the Anschluss of 1938 to construct a representative Government acceptable to the Allies. The new broadened and strengthened provisional Government, headed by Renner, which came into being as an outgrowth of the three-day conference, was formally recognized by the United States, Great Britain, Russia, and France on October 20. Action was taken in behalf of the four occupying powers by the Allied Control Council, on orders from the members' respective capitals; one of the principal conditions enumerated was that free elections were to be held "as early as possible and no later than December 31."

The first national elections in fifteen years were thus held on November 25. Leopold Figl's Rightist Volkspartei (Catholic People's Party) won more than 51 per cent of the seats. Upon resigning, Renner was designated as acting chancellor of the interim provisional government, pending the meeting of the new National Assembly on December 12. In a joint meeting on December 20, 1945, both chambers unanimously elected Renner Austria's President, to serve six years. Future Presidential elections are expected to be by popular ballot. According to the Constitution of 1929, which has been restored with slight modifications, Renner will have limited powers; he can dissolve Parliament but has no power to veto bills passed by the Lower House.

The elderly Renner, who has spent most of his life in Government service, was once General State Librarian of the National Assembly. He has been president of the International Association for Social Progress in Basle, and a member of the International Cooperative Alliance in London. Since 1901, when his first publication appeared, *Staat und Parlament*, he has been a prolific writer, chiefly in the fields of economics, government, law, and socialism. Some writings were published under the pseudonyms of Rudolf Springer and Synopticus. As head of the Austrian Government he is believed to be the lowest paid chief of state in Europe. With his wife Luise, he lives in an old house in the American zone in Vienna, with which his Government provides him.

REYBOLD, EUGENE (rī'bōld) Feb. 13, 1884- Engineer; Delaware State official; former United States Army officer

Address: b. c/o Delaware State Highway Department, Wilmington, Del.

"Of all [United States] Army units," said *Life* in February 1942, "the Engineers are perhaps best known to the peacetime populace. For, in addition to their concern with military establishments, they obtrude often on the civilian consciousness through such matters as flood control, harbor improvement, public works. Army Engineers built the Washington Monument, the Capitol, and the Library of Congress. But it is in war that the Corps becomes the Army's most resourceful, versatile, and valued property. In the Second World War the Engineer Corps was commanded by Major (later Lieutenant) General Eugene Reybold.

"If there is a tough, dirty job to be done in any combat operation, the Engineers will do it. They are at the head of every attacking force—crossing unfordable rivers in assault boats, establishing bridgeheads, reducing bunkers, pillboxes, and road-blocks, building pontoon bridges and gun emplacements under enemy fire. And they are at the rear of every retreating army—laying mines, demolishing communications, seeking by every deadly means to retard the advancing foe. When, as happens, they are overtaken, they pick up their guns and fight. They are proud of the skills and hazards of their calling. For they know that without the Engineers, no modern army could roll." Or, as General Douglas MacArthur '41 told General Reybold, "this is distinctly an Engineer's war."

The Engineer chief was born February 13, 1884, in Delaware City, Delaware, the son of John Franklin and Lydia Maxwell (Tybout) Reybold. The first Chief of Engineers not to attend the Military Academy at West Point—which was founded in 1802 as a school for engineers—Eugene Reybold got his civil engineering degree from Delaware College in 1903, when he was nineteen, and went to work for the United States Engineering Department. At twenty-two Reybold was married to Margaret Eyre Moore, now deceased. (Their daughter Elizabeth Tybout—Mrs. Paul F. Yount—is married to an Army officer, and the Reybold's son Franklin Bell, a West Point graduate, is a Coast Artillery officer.)

It was in the United States Coast Artillery Corps that Gene Reybold was commissioned a second lieutenant in September 1908. After two years at Fort Mott, New Jersey, in the course of which he was advanced to first lieutenant, Reybold was ordered to the Philippines for three years of construction quartermaster duties. On his return to the United States, Lieutenant Reybold was stationed at Fort Banks, Massachusetts, while he worked on the coast defenses of Boston Harbor. Completing this assignment in December 1915, the engineer was sent to Fort Monroe, Virginia, to study at the Coast Artillery School, where he remained as instructor and then director of the Department of Enlisted Specialists. His rank became captain in July 1916, major (temporary) at the end of 1917, lieutenant colonel (temporary) on September 5, 1918, and colonel (temporary) two weeks later. Stationed at Monroe throughout the First World War, Reybold never saw combat, then or later; but the "excellent judgment, energy, and foresight" he displayed there won him the Distinguished Service Medal.

At the end of June 1920 Colonel Reybold reverted to the permanent rank of captain, and was promoted to major the following day. At this time he was on quartermaster duty at Fort Monroe, supervising construction there and at Langley Field, Camp Eustis, and a number of other Army posts in Virginia. In February 1922 the thirty-eight-year-old major returned to the Coast Artillery School for a four-month field officer's course, after which he spent the summer on duty with the 202nd Antiaircraft Artillery Regiment of the Illinois National Guard at Camp Custer, Michigan.

Next Major Reybold was ordered to the Command and General Staff School at Fort Leavenworth, Kansas, where he completed the course in June 1923. Remaining at Fort Leavenworth, he spent three years teaching at the General Service Schools. While at the Command and General Staff School he was transferred in April 1926 from the Coast Artillery to the Corps of Engineers, which is said to include the most brilliant graduates of West Point.

After this Reybold was sent to the Army War College in Washington, D.C., which gives the service's highest training. From August 1927 to October 1932 he served at Buffalo, New York, as assistant district engineer and then as district engineer. In this capacity Reybold directed all the engineering works on Lakes Huron and Erie, and on the Niagara and St. Lawrence rivers, and was a member of the National Control Board for Niagara Falls, as well as having some additional duty with the Second Corps Area's organized reserves. In November 1932 Reybold was given his first promotion in twelve years, to lieutenant colonel, and assigned to the Board of Engineers for Rivers and Harbors in the office of the Chief of Engineers.

U. S. Army Signal Corps
LT. GEN. EUGENE REYBOLD

After a year Reybold was sent to Wilmington, North Carolina, as district engineer, transferring to Memphis, Tennessee, in April 1935. (The widowed colonel was remarried in October 1933, to Ruth Wineow Lord.) In 1937 he successfully fought the tremendous Ohio-Mississippi Valley floods which swept the South and Middle West from Pittsburgh to Memphis. That July he was promoted to colonel and ordered to Little Rock, Arkansas, to become division engineer of the Southwest division.

Three years later Chief of Staff George C. Marshall '40 appointed Reybold to the War Department General Staff as acting assistant chief of staff for supply (C-4), which "oversees most of the household details of Army life, from buying soldiers' underwear to building barracks." (That October, 1940, he was promoted to brigadier general, temporary, and named assistant chief of staff.) "In the greatest peacetime Army expansion in United States history," wrote *Time*, "the General Staff is as busy as beavers in a springtime flood. . . .True to a custom in Washington (a supposed sop to pacifistic civilian taxpayers), Gene Reybold sat down at his desk in shirtsleeves and mufti, a pair of tortoise-shell spectacles camouflaging his military nose. Like most Army men out of uniform, he managed to look more like a country doctor than like the top-flight soldier he is." Assigned to the Office of the Chief of Engineers as acting chief in September 1941, he was appointed Chief of Engineers in October, with the rank of major general.

(Continued next page)

REYBOLD, EUGENE—*Continued*

Only two months after entering on his four-year term General Reybold was faced with directing construction for a global war. As General MacArthur, himself a former Engineer, said to him two years later, "Reybold, this is an air and amphibian war; because of the nature of air and amphibian operations, it is distinctly an Engineer's war." First the Engineers had to put up the largest office building in the world, the War Department's giant Pentagon. Begun in September, 1941, on a design by David J. Witmer and G. Edgar Bergstrom, its five sections were built clockwise in a record-breaking fourteen months by the Engineers under Lieutenant Colonel Clarence Renshaw, and J. Paul Hauck. The first employees moved in in May 1942. The seventy-million-dollar building, of which its architects boast that no two offices on the same floor are more than a half-mile apart, soon caught the public fancy, and stories began to circulate about it—from the true statement that the Great Pyramid of Cheops could be set within the Pentagon, with a few hundred feet to spare, to the apocryphal report that strangers entering the building were invariably lost for days, including one telegraph messenger who finally emerged as a lieutenant colonel.

When Reybold became the Chief of Engineers one soldier in sixteen, or a total of eighty-five thousand, was an Engineer, and it was estimated that the proportion would double in case of war, especially as the combat Engineer troops of the German Army had been responsible for storming fortresses formerly considered impregnable. Even with a war on his hands, Reybold still had to handle flood-control work, bridges, and the care of rivers and harbors throughout the United States. (At the port of New York, for instance, the crew of an Engineers' fleet of three dredges worked seven days a week from March 1941 through November 1942 to cut new anchorages, deepen some channels for the use of huge troop transports, and generally keep the harbor free of mud, silt, sand, and clay.) Like any housekeeper, the Engineers have to sweep the navigable streams constantly, in war or peace. Other Engineer functions of which the public is generally not aware include camouflage, photography, water purification, the testing, developing, and improving of special devices, and contracting for those approved, and the immense task of map making for an army fighting on both sides of the world. (During Reybold's tenure, incidentally, the research section of the Army Engineer School at Fort Belvoir, Virginia, adopted a system of requesting suggestions for devices and methods from any source, which is unique in the armed forces. About 11 per cent of the suggestions had been put to use up to February 1943, and the originators were given full credit and a report on the subsequent development of the ideas.)

"Every battle begins on a map," wrote Reybold in the May 1945 *Popular Science*, "and the Engineers literally had to remap the world for air and amphibious assaults on America's foes. For information about some Pacific islands that are well known steppingstones to Tokyo now, we had to begin by ransacking the memories of old shipmasters and missionaries. For the invasion of France we had to prepare 5,625 tons of maps, which is well over two hundred freight-car loads. The one hundred and sixteen million maps in this single order were approximately four times the total prepared and printed for all of the First World War.

"At the same time that these miles of paper plans were being made, however, the Engineers had to make it possible to move millions of men and billions of tons of matériel over supply lines twice as long as the equator. By June 1942 the United States Army Engineers were directing construction in this country at a rate of twenty million dollars a day. . . . The world's biggest factories and the training camps throughout this country were but a base from which shafts had to be run to spearheads in Africa, Europe, and Asia. And these 'shafts' were no mere lines on a map, but such tangible things as airfields, roads, bridges, ports, railroads, pipelines, and more bases.

"The roads include the sixteen-hundred-mile ['Alcan'] Alaska Military Highway from Dawson Creek, Canada, to Fairbanks, Alaska; the completed portions of the Pan-American Highway from Mexico to the Panama Canal; and the thousand-mile Ledo-Burma Road from India to China. These three new roads run through parts of the world where it previously was impossible to travel by truck. In France alone, Army Engineers have put into operation a road network of four thousand miles, involving the construction of one hundred and forty-five major highway bridges; nearly seven hundred bridges had to be strung over treacherous, snake-filled rivers for the Ledo-Burma Road. But those are only a trifling percentage of the bridges that the Engineers have built during this war," perhaps the most difficult being over the Volturno. Among the other facts General Reybold discloses are that "in France, an Engineer pipeline crew was only thirty-five miles behind the first Americans to enter Paris . . . one and a half million gallons of gasoline a day flowed through the pipes from Normandy"; and "there were more Engineers than infantry or troops of any other service invading Leyte on D-Day. When the Engineers land they stay until an old-timer can no longer recognize the place."

General Reybold, who spent five weeks in 1943 inspecting British and North African installations and who returned in December from a thirty-thousand-mile tour of inspection in the Pacific, reported that his men and the Navy's famous Seabees (Construction Battalions) "get on well together, and either lend or steal equipment from one another." As correspondent Robert Sherrod '44 has pointed out, "the Seabee is an expert before he joins up. The Army Engineer is just an average guy named Joe who got drafted. But Joe learns, and he, too, has accomplished some near-miracles of construction and of fighting in this war. I just hate to see him neglected [by the writers]." As for the Regulars, to quote their chief, "To men trained in the Army Engineers' river-and-harbor and flood-control work, the war is just a somewhat bigger job of shoving earth around."

According to reports, the German High Command was well informed about the Engineer Corps and by no means underestimated its competence. Captured German documents stressed that the redoubtable Engineers who did the manual labor for the combat soldiers often were ten times more efficient than the enemy had estimated. The German Army concentrated forces at important coastal ports in the belief that their possession was essential to the Allies. But American Engineers developed captured minor ports to unheard-of capacities. They built "from scratch" 306 railroad bridges, rebuilt 1,563 miles of rail lines, and restored 237 shattered road bridges. And it was the Engineers who worked out with the British the intricate problem of making the Normandy invasion possible by inventing a way to construct artificial harbors permitting the landing of troops and materials on a hostile shore. Had that been unsuccessful, experts state, the early termination of the war would have been impossible. It was the Engineers, too, who built the vital airfields on every continent. Some of the most dangerous work of the war was performed by them in removing sunken and mined ships from harbors. Working with British material and with Indian and Chinese workmen, the Engineers built the new telephone line along the Ledo Road in Burma.

The spectacular performance of the Corps has not, however, given it immunity to Congressional investigation. The continued construction by the Army until November 1943 of the 905-mile stretch of the 1,600-mile Pan-American Highway through six Central American republics at a cost of $42,715,591—against the original estimate of $14,714,000—although the military necessity for the work had ended in 1942, was criticized by the Senate War Investigating Committee in July 1945. General Reybold testified that he had reported to the Director of Requirements Division of the Army Service Forces on April 9, 1943, that "it is not believed that work already done has been carried out without interference to the war effort, or that work remaining to be done can be accomplished without such interference." His report, however, which would have closed work on the Pan-American Highway, was filed away, and not until August 1943 was a study of the highway project begun and revisions of the military program concluded.

When in April 1945 Reybold was made a temporary lieutenant general, he became the first Chief of Engineers to wear three stars. Up to that date his Construction Division had handled eleven and a half billion dollars' worth of building; his Supply Division had spent six and a half billion dollars since the attack on Pearl Harbor; while his flood-control and waterways experts had outlined a postwar program involving an estimated four and a half billion dollars. But General Reybold did not supervise the postwar project because, on October 1, 1945, he retired as chief of the Army Engineers to join the staff of the Delaware State Highway Department on November 1 as director of the Delaware River crossing division which, following authorization by the Delaware General Assembly in 1945, was scheduled to construct a Delaware River crossing near Wilmington.

The bespectacled general is referred to by *Time* as "husky, golfing (middle seventies) Gene Reybold . . . a crack administrator." In April 1943 he became director of the War Artists Units of military and civilian painters, who were to record war scenes (no official portraits). He was to be assisted by a War Department Art Advisory Committee, of which George Biddle '42 was a member, and by a consulting committee. Reybold, who is a member of the American Society of Military Engineers and the American Society of Civil Engineers, has received honorary doctorates since 1940 from the Universities of Delaware and Arkansas, and the Drexel Institute of Technology. He feels a certain superiority to Omar Khayyám, for the poet's yearning to "grasp this sorry scheme of things entire" and "remold it closer to the heart's desire" has been, he feels, "almost literally" fulfilled by the Army Engineers.

RICKEY, BRANCH (WESLEY) Dec. 20, 1881- Baseball executive

Address: b. Brooklyn National League Baseball Club, 215 Montague St., Brooklyn, N.Y.

"No man in baseball in the last quarter of a century, with the possible exception of Judge Landis '44 and Babe Ruth '44, has left so deep an impress on the game as Branch Rickey," writes Frederick G. Lieb. Rickey, now president of the Brooklyn Dodgers, "devised a method whereby the poorer clubs could cope on equal terms with the more opulent ones." Generally considered the best judge and shrewdest trader of baseball talent in the world, "The Brain" invented the "farm system" for developing players, and incidentally earned for himself what is said now to be the highest salary in baseball.

A descendant of pioneers, Branch Wesley Rickey was born on a farm in Stockdale, Ohio, on December 20, 1881, the second of three brothers. His parents, Jacob Franklin and Emily (Brown) Rickey, known to everyone as Uncle Frank and Aunt Emma, were farmers, not very well off financially but distinguished for their piety and for Frank Rickey's ability as a wrestler. "Weck," as young Rickey was called, was brought up in the strict Wesleyan discipline, and has never been known to drink, use profanity, or work on Sunday, although he now smokes cigars. After completing the course at the local school, he was hired to teach in another country schoolhouse. From a salary of thirty-five dollars a month, the youth bought a bicycle on which to travel the eighteen miles to school from his home, books from which he taught himself Latin, rhetoric, and higher mathematics, and managed in two years to save sixty- or seventy-odd dollars toward college expenses. Two local educators encouraged him, lending him additional books and coaching him for the entrance examination to Ohio Wesleyan University. As a trial, Rickey took the West Point examinations, but did not seek appointment when he passed.

Young Rickey was a good athlete, organizing baseball and football teams on which "he was always the manager and always the catcher," the position from which he could see the entire picture and give directions. He paid his way through the university as a professional athlete,

BRANCH RICKEY

playing baseball in summer and football in the fall and winter. According to Lieb, Rickey got "as high as a hundred and fifty dollars a game for playing the backfield for the strong Shelby (Ohio) professional football club. A broken leg closed his gridiron career in 1902. His leg healed by the following spring and he started the 1903 season as catcher for the Lamar (Wyoming) baseball team. Rickey went up quickly that season; by July he was with Dallas in the Texas League, and a month later Branch had the first taste of the major leagues when he was purchased by the Cincinnati Reds." The Cincinnati manager released him, however, because of his refusal to play on Sunday, the most profitable day of the week. His contract reverted to Dallas, and in 1904 (the year he received his Litt.B. degree) he caught for the Dallas team. Late that year he returned to the major leagues via the Chicago White Sox, who traded him to the St. Louis Browns.

Meanwhile, Rickey continued his studies, earning his B.A. from Wesleyan in 1906. That June the twenty-four-year-old Ohioan fulfilled another long-standing ambition by marrying Jane Moulton, daughter of the proprietor of the Lucasville general store, after proposing more than a hundred times. According to Lieb, after getting his degree Rickey coached for a time at Alleghany College and then at Delaware College, both in Ohio. He continued to play baseball during the season, although it was considered a rough and rowdy game, but in 1907 began to show signs of strain. For the New York Yankees (then the Highlanders), who had him that season, Rickey made the lowest average in the league both as catcher and outfielder, and failed to prevent the Washington Senators from stealing thirteen bases in one game—an all-time record in the American League. In the 1908 off-season, incidentally, Rickey toured as a prohibition lecturer; later that year he entered the University of Michigan law school. There he took a three-year course in two years and went on to his doctorate, at the same time coaching the Michigan baseball squad. (It was there that he discovered the great George Sisler.) By the time Rickey had his J.D. in 1911, his health gave way completely. He lost fifty pounds, and was forced to go to Saranac Lake to recuperate from tuberculosis. Upon his return he went to Boise, Idaho, and opened a law office.

In 1913 the owner of the St. Louis Browns, Colonel Bob Hedges, invited Rickey to become one of his scouts, covering the Pacific coast teams. Accepting, the lawyer later became club secretary and still later succeeded to the managership. (Burt Shotton was the Sunday manager for Rickey, then and later.) In 1914 and 1915 Rickey's team finished in fifth and sixth places, respectively, whereas for the preceding four years the Browns had not been better than seventh. When Hedges sold the club to Phil Ball, Rickey remained as vice-president and business manager. Meanwhile, most of the important St. Louis businessmen had combined to purchase the St. Louis National League club, the Cardinals. In *The St. Louis Cardinals* (1944), Lieb tells how in early 1917 the instigator of the campaign asked St. Louis sports editors and baseball writers whom they would recommend for club president, and found only one name on all the ballots—Branch Rickey. Rickey accepted the offer, for he "never was happy under the blustering Ball with his high voltage adjectives." Ball refused to release his business manager, and the latter had to go to court to prove that his contract permitted him to change jobs if a better one was offered. Later, when Don Barnes purchased the Browns from the Ball estate, Rickey represented both parties and received a reported commission of twenty-five thousand dollars.

Branch Rickey's first year as club president saw the Cardinals rise from a tie for seventh place in the league to third, but most of the credit went to manager Miller Huggins. (Rickey also introduced Ladies' Day to St. Louis.) When the War Department issued its "work-or-fight" order on Labor Day 1918, the thirty-six-year-old executive joined the Army, and was soon a major in the new Chemical Warfare Service. On his return after the Armistice, Major Rickey also assumed the duties of field manager, and acquired his former assistant Burt Shotton from the Washington Americans to act as outfielder and Sunday manager. Rickey also found some other good players: his "uncanny ability to pick baseball material" was in evidence; and "the famous Rickey notebook, in which the names of many great players of the future were noted, already was a fixture. They used to laugh a lot about that notebook . . . yet that notebook gave St. Louis fans hundred-thousand-dollar ballplayers for the price of a railroad ticket." But the club was $175,000 in debt and could hardly meet operating expenses. "We didn't even have money enough to send the club south for spring training," Rickey recalled a quarter-century later, "so we trained at home. We even wore the same uniforms at home and on the road. . . .I had to pass up my salary to meet the payroll. It was really rugged." On one occasion the president-manager sneaked a rug from his own home, without his wife's knowledge, to brighten his bare office when business visitors were expected.

As a result, minor league officials whom Rickey approached would often wire to richer teams, saying that if Rickey wanted a certain player that player must be good, and the other club would be in a position to make a better offer for him. Or, if Rickey turned a discovery of his over to a minor league team for seasoning, the minor manager might "double-cross" him and sell his discovery to a rival club. "That kind of thing drove me mad," says Rickey. "I pondered long on it, and finally concluded that, if we were too poor to buy, we would have to raise our own." By 1919, therefore, the Cardinal boss took a step which was eventually to change the entire minor league setup by establishing the "farm system," with the major-league team owning a hierarchy of minor clubs. He began modestly enough, by buying 18 per cent of the stock of the Houston club (Texas League). Then he acquired Fort Smith (Arkansas) in the Western Association, a Class C team. In 1920, when Sam Breadon had replaced Rickey as president, leaving him as manager and later as business manager, Rickey continued to expand the Cardinals' holdings. Part ownership proving unsatisfactory, they bought out their partners. "Rickey even went so far as to back entire leagues," says Lieb, "and at one time he controlled the entire player supply in the Nebraska State and Arkansas-Missouri leagues. But this was too much for Commissioner Landis, opposed to Rickey's idea from the start, and the Cardinals were limited to one club in each of these leagues, Farmer Branch finding big-league sponsors for the other teams."

The farm system was first ridiculed and then bitterly attacked as "Rickey's chain gang," but it produced players whose listing "reads like a World Series Who's Who." Within a few years the very clubs which had scoffed at Rickey's farm system were establishing their own—and were paying fancy prices for home-grown Cardinal players. As for the Cardinal empire itself, by 1940 the Redbirds owned thirty-two clubs outright and had optional agreements with eight others, there being some six hundred players involved. The only Class D league in organized baseball in which the St. Louis club was not represented was in Canada.

But, after the first few years, Rickey was less successful on the field than off. In 1920 the Cardinals turned down an offer totaling $350,000 from the New York Giants for the star Rogers Hornsby, but the team ended in a tie for fifth place. The next year they were third, and led both leagues in batting averages. Rickey's team was third again in 1922, and President Breadon signed the manager to a five-year contract. Things went wrong in the 1923 season, however; there was trouble between Rickey and Hornsby, climaxed by a fist fight between the manager and his star player, and the latter worked in only 106 games, while the rest of the team "slipped perceptibly." After the Cardinals had ended two seasons in fifth and sixth places, respectively, and had drawn very poor attendance at the beginning of a third, Breadon replaced Rickey with Hornsby, keeping the former as vice-president and business manager. Chagrined, Rickey sold all his Cardinal stock to his successor, making a profit of twenty thousand dollars; less than two years later, the same stock went for several times what Rickey sold it for.

"Too much theory and too little practical baseball" seems to be the consensus as to why Rickey failed as manager; his readiness to sell or trade experienced players and replace them by younger men is also cited. "There wasn't anything wrong with Rickey's baseball theories," Roy Stockton says. "Major league managers still use many Rickey innovations—blackboard talks, sliding pits, plays to catch runners off base. [But] Rickey's players could not understand his ideas or execute them." After he took charge of the front office, with complete charge over all personnel except the manager, the Cardinal organization showed a profit for every year but three. "Rickey, gathering thousands of young prospects, found enough stars to win pennants in 1926, 1928, 1930, 1931, and 1942—and world championships in four of those years. . . . It is no reflection on Rickey's over-all ability that he touted many players as sure-fire stars, only to have them flop out without leaving an imprint on the majors. Besides getting publicity, that also demonstrated another Rickey asset—unbounded enthusiasm and steadfast devotion to his job. And it didn't hurt the Cardinal sale of players either." In that sale of players, the Ohioan demonstrated his ability to tell almost without exception when a star player had passed his peak, and to sell him while his drawing power still surpassed his playing power, and while baseball executives were willing to pay high prices for that drawing power.

Despite his own strict conventionality, Rickey showed a great feeling for "color," even to the point of eccentricity. It was he who created "the most colorful, picturesque club of modern baseball," the Series-winning Gashouse Gang of 1934, composed of players like Dizzy Dean, Pepper Martin, Lippy Durocher '40, Muscles Medwick, and Showboat Orsatti, and managed by the umpire-baiting Frankie Frisch. It was typical of the mad but successful team that, at Leo Durocher's request, Rickey successfully appealed to a certain Miss Grace Dozier, as an old friend and a Cardinal fan, to marry his shortstop at once and clear his mind for the World Series. Later, when most of the Gashouse Gang stars were sold to Larry MacPhail '41, much of that reputation went with them to the Brooklyn Dodgers.

Less than a month after the Cardinals had won the 1942 World Series, Breadon notified Colonel Rickey (who was military aide to Governor Forrest Donnell) that his contract would not be renewed. One reason was his large salary and profit-sharing arrangement, totaling $88,000 for 1941 and $65,000 for 1942—the highest income in baseball, and perhaps disproportionate in wartime for a club whose salaries are said to be less than average. Rickey immediately signed a five-year contract, at a reported salary of $85,000, as president and general manager of the Brooklyn Dodgers, succeeding his friend and "prize pupil" Larry MacPhail. After thirty-eight years in baseball, Rickey remarked that "it will be gratifying not to worry about the money involved in player deals." The Brooklyn farm system, in-

RICKEY, BRANCH—*Continued*

cidentally, had been headed by Branch Rickey, Jr., since 1939. (Rickey, Sr., also has five daughters.) A three-man syndicate headed by Rickey purchased 25 per cent of the Dodger stock, which Frank Graham, the team's historian, termed "a tangible expression of confidence on the part of a man who doesn't make bad investments." After a year *Look* reported that the new boss had "ironed out many a Dodger wrinkle—umpire-baiting, bean balls, and high-stake card games have been replaced by seriousness and esprit de corps." After two years Rickey had made himself unpopular by "payroll paring," which included his "selling down the river" favorites like Dolph Camilli, Medwick, Bobo Newsom, and Johnny Allen. The Dodgers were in seventh place in 1944, but Rickey continued his long-range program, and at the end of the 1945 season they were third in the league.

During 1945 Rickey advocated the appointment of a national sports coordinator, and announced his intention of "putting a football team on the field as soon as practicable." He extended the Dodgers' farm system by purchasing the Fort Worth club (Texas League), and enlarged his own holdings by increasing his syndicate's share of the stock to 75 per cent by acquiring an additional 50 per cent through the purchase of the stock of the Ebbets estate. The sixty-three-year-old executive was appointed by Mayor Fiorello H. La Guardia '40 of New York as one of a ten-man committee, to make recommendations on eliminating "the color line in baseball." This was of particular interest because Rickey had in April been the first major league president approached for tryouts for Negro players, and in May he had announced the formation of a new Negro baseball league, the United States League, and the renting of Ebbets Field for games by the Brooklyn Brown Dodgers. Sports writers expressed puzzlement over the move, while Joe Bostic of the *People's Voice* declared that Rickey's interest was in "widening the outposts of segregation."

Then, in October 1945, Rickey made baseball history with the signing of Jackie Robinson, the first Negro player ever to be signed by any club in the history of modern organized baseball, by the Dodgers' Montreal farm team of the International League. The opportunity afforded Robinson represented the first success scored by all the organizations and individuals who have been clamoring for big league baseball to end its traditional discrimination against Negro players. Some quarters who protested the signing declared that since organized baseball derived substantial revenues from the operation of Negro leagues, these leagues would fail if they were "raided" of their players, as Robinson had been taken from the Kansas City Monarchs. The Chicago *Defender*, national weekly newspaper published for Negroes, placed Rickey on its annual honor roll of leading Americans who distinguished themselves in 1945 by improving race relations.

Rickey is a trustee of Ohio Wesleyan, a member of the board of Westminster College and of the Methodist Board of Temperance, Prohibition, and Public Morals, alumni secretary of Delta Tau Delta, and belongs to two bar associations, three veterans' associations, and various civic clubs, social organizations, and fraternal orders—and makes speeches before all of them. In 1928 McKendrick College gave him an LL.D. A Republican, he was mentioned by the New York *Post* of December 20, 1944, as one of "a group of Governor Dewey's '44 closest friends and political supporters."

The "Mahatma," as sports columnists like to call Rickey, now "chunky and bespectacled," is described by *Time* as looking "like Lionel Barrymore '43 playing Thaddeus Stevens" and talking "like an evangelist, in a voice that exploits the whisper as aptly as the roar." He has, in fact, a reputation as a lay preacher and is known among sports writers for a pontifical manner, the length and intricacy of his statements, the ease with which he obscures the answer to an unwelcome question, and his fine feeling for the colorful and humorous details which add human interest. He has kept up all his contacts, and "those friendships constitute a valuable chain, stretching from coast to coast, and provide an effective voluntary scouting system."

RINGLING, ROBERT E(DWARD) Aug. 16, 1897- Circus executive; singer
Address: Sarasota, Fla.

The world's largest circus, Ringling Brothers and Barnum and Bailey Combined Shows, Inc., has become an American institution whose arrival each year is eagerly awaited in cities and towns throughout the Nation. The president of this circus since 1943 has been Robert E. Ringling, the first Ringling to head the "Big Show" since the founding family lost control in 1933. Returning after many years on the opera stage to the circus world which he had left as a young man, the former baritone of the Chicago Civic Opera Company has brought a good business sense as well as a rich musical background to the "Big Top."

The son of Charles Edward and Edith (Conway) Ringling, Robert Edward Ringling was born in the little town of Baraboo, Wisconsin, on August 16, 1897. The story of his parents and the beginnings of the circus is inherently a part of Robert Ringling's story. His mother was the daughter of the local Methodist minister; his father was the youngest of a family of eight children—seven sons and a daughter—of a Baraboo harness-maker who made a comfortable living from his small business. The Ringlings were a music-loving family, and Robert's father and uncles taught themselves to play various musical instruments; when they were young men, five of them formed a family orchestra at home, later earning money by playing for local concerts and dances.

By 1880, when Charles was eighteen, the group had developed into the Ringling Brothers Classic and Comic Concert Company. The brothers themselves provided the entertainment for the *Carnival of Fun*, as the musical program was called. Later, when the young men began to accept one-night stands around Baraboo, they added a comic sketch or two to enliven the show. Mrs. Charles Ringling, still a very lively person known as "The First Lady of the Circus," never tires of talking of these early days and the development of this "small company of small-town boys." The world's greatest circus, she points out, grew out of a love of music. In 1884, thirteen years after P. T. Barnum had started his circus, the young impresarios had saved enough money to invest in a small wagon show, which consisted of a few circus acts, some animal acts, and a band. It was a great day when an elephant joined their trained horse and the dancing bear, even though the elephant was rather knock-kneed, and the animals mangy. In 1890 the old wagon show had been changed to a railroad show.

Charles Ringling and Edith Conway were married in these exciting days; after their son Robert was born in 1897 he spent his early years with the circus caravan. His mother recalls that there was a five-octave piano in the private car which was the family's living room for eight months of the year, and almost every evening a group gathered around it, Charles Ringling playing the piano, Mrs. Charles singing and playing the cello or some other instrument. Mozart sonatas, Strauss waltzes, and popular and classical songs were a daily part of Robert's childhood. Later he went to school in Baraboo and traveled with the circus during the summer. When he was seven he began the study of the violin and took singing lessons. After several years, realizing that he did not have the hands of a violinist, he gave up the instrument to concentrate on singing. All this musical training was an excellent foundation for the work of the future circus executive, for music is an integral part of any circus.

When Robert was nine years old his parents took him abroad, where in London he was fascinated by the Coldstream Guards. For years he was to hold a vivid memory of the changing of the guard and to cherish a dream of using the colorful ceremony as the basis of a circus act. After returning to America he developed an enthusiasm for playing punchboards. At one time when the circus train stopped at Redding, California, to feed the animals, Robert was given permission to play a few games in the town, but he was cautioned to return in fifteen minutes. With two members of the company he played his favorite gambling game until he had won forty dollars in gold pieces; then the trio went back to the feeding stop to find that the train had left. Robert's forty dollars were spent in hiring an automobile to take them to the next town, forty miles away—and his interest in punchboards ceased after this adventure.

ROBERT E. RINGLING

Intensely fond of all sports, Robert was particularly devoted to sand-lot football; when he was twelve he broke both hips in a game and was unable to walk for four years. Seventeen months of this period were spent in bed in a plaster cast. According to his mother, the boy turned the painful interval into a profitable time by spending most of the days listening to phonograph records, learning songs, arias, and various roles, and perfecting himself in languages. "He emerged from this ordeal with a background of musical knowledge that was most helpful to him when his own career began."

In circus vernacular, one who loves the circus and cannot live away from it is said to have "sawdust in his nose"; outsiders and amateurs are called "gillies." Judged by circus standards, Robert did not have sawdust in his nose, for he entered the Evanston (Illinois) Academy of Fine Arts when he was about sixteen, graduating from there in 1914. He then entered Northwestern University, but left it when he found he could not do justice to both his university work and his singing. He was married on December 8, 1920, to Virginia Elizabeth Sullivan. (Four sons were born to the couple. Two of the sons and Mrs. Ringling are now deceased.)

The young singer made his debut as an operatic baritone in Tampa, Florida, in 1922, then toured the United States with the San Carlo Opera Company for a year. Another tour followed with Josephine Lucchesi in the Middle West and South. By this time he had left the circus definitely, or so he thought, and in 1924 he went abroad to study. He first became a member of the State Opera Company in Ulm, Germany; a year with that company was followed by a year in Munich with the National Opera Company, and a year with the State Opera at Darmstadt. After his return to America in 1927 he became a member of the Chicago Civic Opera Company, and during the summer for the next three years he sang with the Cincinnati Zoo Opera Company.

On November 17, 1927, the young baritone of the Civic Opera Company made his debut

RINGLING, ROBERT E.—*Continued*

in the role of Tonio, the heartbroken clown of *Pagliacci*. It is said that he received a dozen curtain calls after this performance, and today many critics consider the role to have been his most successful one. The singer also won distinction as Faninal in Richard Strauss's['44] *Der Rosenkavalier,* as Mephistopheles in *Faust*, and in many Wagnerian parts; he had an extensive repertoire of more than a hundred roles in French, Italian, and German. Dr. Ringling, as he was called in musical circles after receiving the honorary degree of Doctor of Music from Rollins College in 1930, remained with the Chicago Civic Opera Company until 1939 when he retired from the professional opera stage. In 1940 he was married to Irene Bauernfeind.

In 1907 Ringling Brothers had bought the Barnum and Bailey Circus for four hundred and ten thousand dollars. Soon afterward the organization took the double name by which it has since been known: Ringling Brothers and Barnum and Bailey Combined Shows, Inc. John Ringling, the last of the five founders of the Ringling contingent to direct the combined enterprise, also bought other smaller circuses. Under his long leadership the business prospered, and by 1924, forty years after the first Ringling wagon show appeared, John Ringling was rated one of the thirteen richest men in the world. So vast was the enterprise that the payroll included five thousand persons and it took two hundred and forty railroad cars to move his shows.

By 1929 circus profits had reached an all-time high of a million dollars. But that spring Ringling borrowed over a million dollars to buy the American Circus Corporation, which owned Sells-Floto and several other circuses, putting up Ringling Brothers-Barnum and Bailey stock as security. By this elaborate business deal he kept alive the tradition of the spring opening in Madison Square Garden (which Sells-Floto had previously engaged). His attempts to keep his circus going were useless, however, for the Wall Street crash of 1929 "froze his wealth solid," to use the words of the *Saturday Evening Post.* Some writers have pointed out that circus profits probably would have dropped considerably at this time anyway because of indirect competition with radio and motion pictures, and direct competition with a swarm of smaller circuses "which nibbled away at the Greatest Show on Earth." By 1932 John Ringling had paid off part of his debt, but later he was forced to give so much additional circus stock for collateral (he also gave his entire personal estate, including railroads, oil wells, and art collections) that the Ringling family lost control of the circus. In 1936 John Ringling died, technically bankrupt. But the following year his estate borrowed nearly a million dollars from the Manufacturers Trust Company of New York to buy the note held by the Allied Owners Corporation which had acquired control. This organization continued to operate the circus but critical opinion said the Big Show became so dull during its period of control that the public had almost lost interest in it.

With control once more in Ringling hands, the Greatest Show on Earth staged a comeback under the direction of John Ringling North (the son of John Ringling's sister Ida), who had become president of the organization as executor of his uncle's estate. John Ringling had been a good showman; he had had sawdust in his nose. North was also a good showman, but to circus people he was a "gillie," or an outsider, because he had left the circus when a young man to become a broker. They were critical of him when he returned to the circus world, blaming labor troubles and other difficulties on the jinx which a gillie is apt to cause. However, John Ringling North made the circus pay profits during the period—less than three years—of his directorship. He believed that the circus needed streamlining, and under him it received a Norman Bel Geddes['40] modernistic setting, a Stravinsky['40]-Balanchine['42] ballet, and Gargantua, the gorilla, in a twenty-thousand-dollar, air-conditioned cage. North's first season, 1938, was cut short by strikes, but 1939 showed a profit, and 1940 a record profit. In October of that year the estate paid off its note to the bank, and in September 1942 the note to the estate was paid off.

In January 1943 there was a shakeup at a directors' meeting, a disagreement that occurred because North did not want to take the circus on the road that year. Other members of the group felt that the circus might never go on again if it were allowed to be idle for a year. As a result of this meeting, active managership of the Greatest Show on Earth passed from the hands of John North to Robert Ringling, his mother, and Mrs. Aubrey Ringling; Robert became president, his mother and aunt became vice-presidents, and James A. Haley, a circus official for many years, became first vice-president. The Ringlings now own all except a few shares of the circus stock.

When the managership of Ringling Brothers-Barnum and Bailey was "thrown into Robert's lap," he was not unprepared for the position, despite his years in the opera, for during his boyhood summers with the circus he had been instructed by his father in circus management. In 1937 he had assumed the duties of senior vice-president, in addition to the presidency of the Ringling Trust and Savings Bank. When he took over the direction of the circus in 1943, the modernistic *décor* was dropped and, according to *Time* Magazine, "once again everything was traditional, absurd, and gaudy." One of the most successful numbers was a spectacular pageant of elephants built around the idea of the changing of the guard, which had been in Ringling's mind since boyhood. The year 1943 presented many wartime difficulties, but June 1944 found the circus winding up its "longest, biggest indoor run of all time and completely out of hock financially." Then, in July 1944, occurred the Hartford (Connecticut) fire in which the death toll was a hundred and fifty-eight. The circus resumed its tour a month later, playing in open-air theaters. On its tour the following spring it carried with it seventy-five thousand yards of new canvas which had been flame-proofed under a process used for Army and Navy tenting. As a result of the tragedy six of the circus officials received prison sentences on charges of involuntary manslaughter. One of them, James Haley, was removed from the board of directors, but remained as one of the vice-presidents. All six were endorsed by the directors at their annual meeting in the spring of 1945 in a resolution commending them for having "unselfishly" pleaded "no contest" to the charges for the benefit of the circus corporation, "notwithstanding their sincere belief in their own innocence." Had the six elected to stand trial, the successful operation of the circus might have been prevented, the resolution set forth.

The forty-six-day engagement at Madison Square Garden in 1945 broke all New York records as to gross profits and attendance in the history of Ringling, Barnum & Bailey, exceeding the previous year's record of $1,500,000 by $100,000. No dividends were to be paid, however, until the Hartford fire claims were liquidated, *Variety* reported on May 23. By the end of November of 1945 it was announced by Attorney Edward S. Rogin, receiver of the Ringling Brothers and Barnum & Bailey Combined Shows, Inc., that cash and assets in the amount of $755,000 were available for the benefit of the estates of those who had died or were injured in the circus fire.

Robert Ringling is five feet eight inches tall and stockily built. He has blue eyes and thinning gray hair, and is described as a quiet, unostentatious, but self-assured person. Though he frequently carries a cane, it is not for effect but because of his childhood accident. His employees like him, calling him "Mr. Bob." His attractive wife and his two sons, James Conway and Charles Joseph, are frequent visitors to the circus. Ringling is interested in yachting and powerboat racing, and is a member of numerous sports clubs in and around Chicago and in Florida. Although he has retired professionally from opera, he "keeps his baritone in trim" by frequent appearances on church and concert programs. He does not feel that the transition from opera to circus has been difficult. Both are lavish spectacles, he has pointed out, depending to a large extent on staging, costumes, colors, lighting, and broad gestures for effectiveness. "They're very much alike," he has also remarked; "they're both crazy."

RIPLEY, ROBERT L(EROY) Dec. 25, 1893- Cartoonist; author

Address: b. 2 W. 67th St., New York City; h. Taylor's Lane, Mamaroneck, N.Y.

"Believe It or Not, this is Ripley," says the road marker before a certain American town—a bow to Robert L. Ripley, probably the best-known "disseminator of the incredible truth," whose daily audience numbers some eighty millions. A nationwide survey showed that, with the single exception of front-page news pictures, Ripley's *Believe It or Not* cartoon was the greatest reader-interest feature in newspapers, exceeding even the front-page headline news; and its creator has also been successful on the radio, in writing books, as a lecturer, and in producing "Odditoriums."

LeRoy Ripley, who added the name Robert twenty years later, was born in the small town of Santa Rosa, California, on Christmas Day, 1893. His mother, Lily Belle (Yocka) Ripley, whose parents were Western pioneers, had been born in a covered wagon; his father, Isaac Davis Ripley, was a carpenter. At eleven, Roy was graduated from grammar school and entered the Santa Rosa High School, where his English teacher recalls him as "a dear, shy boy." She noticed his skill in drawing and, aware that he disliked composition, offered to accept an illustration in place of each assigned paper. Young Ripley therefore illustrated nearly all the classics studied, doing research to ensure the accuracy of his drawings. When the boy was twelve his father died, and he had to help support his mother, younger sister, and brother Douglas, whom he looks on as more a son than a brother. Roy got a job after school polishing gravestones for a tombstone company, and later left high school to go to work; but although he never graduated he drew the cover of the graduation number of the school publication.

When Ripley was fourteen he sold his first commercial drawing to the old *Life* Magazine for eight dollars. Titled *The Village Belles Were Wringing*, it showed three girls wringing clothes over a washtub. During the summers the boy pitched on a semi-professional baseball team, receiving anywhere from seven to fifteen dollars a week for pitching and drawing a weekly baseball poster for the team owner. His baseball career was to be cut short by an arm injury sustained while trying out for the New York Giants, but his posters brought him to the attention of the editor of the San Francisco *Bulletin*, who hired the sixteen-year-old boy as sports cartoonist for eight dollars a week, later raised to ten dollars. When Ripley asked for another raise he was fired, went over to the San Francisco *Chronicle*, and repeated the process, this time getting up to twenty dollars a week before being discharged. In 1913, when Ripley was twenty, he left the West Coast for New York, where he was hired by the New York *Globe* for twenty-five dollars. The *Globe* insisted that their sports cartoonist should have a more athletic-sounding name than LeRoy, so the Californian became Bob Ripley, demoting LeRoy to a middle initial, L.; his old friends still call him Roy, however. Here Ripley drew one or two sports cartoons a week, spending most of his free time playing handball at the New York Athletic Club. He also did some wrestling, and in 1916 he and "Bugs" Baer put on a wrestling match at the old Lexington Opera House.

In December 1918, Ripley had a deadline to meet and no idea as to subject. At last he "hurriedly gathered together a few athletic oddities," drew cartoons of seven men who had set records for running backwards, hopping, broadjumping on ice, and so forth, and grouped them under the heading "Believe It or Not!" Reader response was so favorable that Ripley was encouraged to devote himself to athletic oddities, and then to oddities of all kinds, making a regular weekly feature of it. In 1919 he was married to a *Follies* girl named Beatrice Roberts, who had been

ROBERT L. RIPLEY

a beauty contest winner in Massachusetts. (They were divorced some years later.)

When the *Globe* ceased publication, in 1923 Ripley joined the staff of the New York *Evening Post*, with which he remained until 1928. (His two books on travel, one on handball, and another on boxing had been published before this time.) His feature was syndicated in about thirty papers, and Ripley also drew pictures for *Collier's*, but, as Geoffrey T. Hellman remarked in the *New Yorker*, "he never made as much as ten thousand dollars a year" until 1928, when the publisher Max Schuster '41 finally persuaded him to put *Believe It or Not* into book form.

Simon '41 and Schuster sent a copy to William Randolph Hearst, who instructed his gigantic King Features Syndicate to sign Ripley to a contract paying over one hundred thousand dollars the first year. By the beginning of the forties Ripley's *Believe It or Not* was appearing in nearly three hundred American newspapers and was being translated into seventeen languages for publication in thirty-eight other countries. It is said that no newspaper had ever canceled its subscription to *Believe It or Not*, even in the depths of the depression, until the Second World War; and that the cartoon brings its creator a gross income of half a million dollars. From this amount, however, he has to pay a staff of sixty-six, including the researchers who unearth his material and a dozen secretaries—this in addition to the nine persons King Features assigned to the Ripley mail, which is said to be the heaviest received by any individual in the world. In 1930 the Post Office finally refused to attempt to decipher the many trick addresses of letters to him.

Another consequence of the first *Believe It or Not* book was a three-hundred-fifty-thousand-dollar contract to make twenty-six movie shorts for Warner '45 Brothers-Vitaphone in 1930 (he has done more since); and in April of that year Ripley put his feature on the air in dramatized form, under the sponsorship of Colonial Beacon Oil Company. Ripley's voice is not "radiogenic," but he took diction lessons to such good effect that he no longer stutters, and received the honorary degree of Doctor of Oratory from Staley College of the Spoken Word in 1940. After completing his first radio series, Ripley was sponsored successively by Standard Oil, the Hudson Motor Car Company, Standard Brands, and Nehi Company (for Royal Crown Cola). *Believe It or Not* is described as the first commercial program to use remote pick-ups consistently; Ripley used them for interviews with persons who spoke from the rapids of Colorado River, an iron lung, the North Pole, underneath Niagara Falls, and from the air. One of his two-way interviews from New York was with Douglas "Wrong-Way" Corrigan in Dublin; another time Ripley gave a "play-by-play" description of fire-walking. On the program which began in 1940, *See America First with Bob Ripley*, he went further, transporting his entire program staff, including the vocalist, agency representative, and all the writers and engineers, in order to broadcast from such unlikely places as the bottom of the Grand Canyon, a snake pit, and an underwater garden. In November 1940 Ripley's program was described by *Radio Guide* as "consistently, the most interesting and thrilling program on the air." In 1945 he went on a CBS program, *Romance, Rhythm, and Ripley.*

Not only has *Believe It or Not* gained wide popularity through Ripley's writings and radio work but also through his "Odditoriums," or exhibits. His first large-scale exhibit was shown at the Chicago World's Fair in 1933; it is estimated that more than two and a half million people visited the display. At both the New York World's Fair and the San Francisco Exposition, the "Odditorium" was one of the most successful displays. Ripley's later books, devoted to oddities, include *The New Believe It or Not Book* (1931), *Believe It or Not Omnibus* (1934), *Believe It or Not Big Book* (1939). Several disclosures in *Believe It or Not* have historical importance. He revealed, for instance, that "The Star-Spangled Banner" had never been officially recognized as the national anthem of the United States. More than five million people signed a petition urging Congress to rectify this lapse, and Congress complied in 1931.

For the educational value of his work, Ripley has received honorary degrees from Dartmouth and Missouri Valley College; Oglethorpe University selected him as "the outstanding cartoonist of the age," and put some of his work into the repository of contemporary civilization which they are leaving for future generations. He has kept out of politics, although the local Democrats offered him their nomination for mayor. He is a member of the Circumnavigators, Explorers, Lotus, and Adventurers clubs, of the American Geographical and National Geographic Society, and of the British Royal Geographical Society.

Ripley has a passion for traveling, and intends to visit all countries of the world which, he has calculated, number two hundred and fifty-three. When the United States entered the Second World War, he still had fifty-three more to go—his entry in *Who's Who in America* says he has traveled in two hundred countries. (This makes no allowance for territorial changes resulting from the war.) Ripley claims also to have employed every known method of transportation. When traveling by air he likes to take along a batch of his unanswered mail (he says he has a million unanswered letters) and write replies, tossing the old letters casually out of the plane. He enjoys the thought of people receiving his answers "several years late, and postmarked from Sarawak or Cambodia."

Bion, his island home (the name is formed from the initial letters of *Believe It or Not*), lies off Mamaroneck in Long Island Sound. It also houses a museum of curios whose worth the owner estimates at two million dollars. "My home is my hobby," he says, pointing out that it is his first real home—he bought it in 1930, fifteen years after his mother's death. A big, energetic man with dimples and a receding hairline, Ripley has not allowed his protruding front teeth to be completely corrected because he felt they were familiar to millions of people. The cartoonist draws from seven to eleven in the morning, and his assistant fills in details and lettering. He spends much of his time arranging new acquisitions (he is said to have three agents covering the auctions for suitable curiosities) and rearranging old totem poles, Buddhist shrines, instruments of torture, and other "oddities." He never eats lunch, making up for it by frequent snacks, and he maintains a steam room to keep his weight down. Ripley believes that people grow old by relaxing too frequently, and his own motto is, "Keep going."

ROBESON, ESLANDA (CARDOZA) GOODE Dec. 15, 1896- Anthropologist; author

Address: h. The Beeches, Enfield, Conn.

"Africans are people," says Eslanda Goode Robeson in the closing sentence of her story of a trip across the Dark Continent. What she learned about these people and their lives is graphically told in *African Journey*, published in August 1945. An American anthropologist and author, Mrs. Robeson is the wife of the internationally known Negro actor and singer, Paul Robeson '41. Active in the cause of the Negro people, she is a lecturer on race relations and other aspects of democracy.

Born in the Nation's Capital on December 15, 1896, Eslanda Cardoza Goode is an American of the type her husband sings of in the *Ballad for Americans*. Questioned by reporters once on the subject of her ancestry, she replied "mischievously but truthfully" that she had "some Spanish, English, Scottish, Jewish, American Indian, with a large majority of Negro blood." Her father held a clerical position in the War Department, while her maternal grandfather, Francis Lewis Cardoza, well known for his early awareness of the problems of his people, served during Reconstruction days as South Carolina's Secretary of State as well as of the Treasury.

ESLANDA GOODE ROBESON

Brought up in a prosperous, intellectual atmosphere, the girl was deeply influenced by the family's strong interest in politics and racial questions. After studying for a period at the University of Chicago she decided on a career in chemistry. She came East to New York, where at the Teachers College of Columbia University she earned her Bachelor of Science degree in chemistry in 1923. Two years previously, on August 17, she had been married to Paul Robeson, then a student at Columbia Law School. During her student years she began to work as surgical technician and chemist at the Presbyterian Hospital, a position she held until 1925. (She believes that she was the first Negro ever engaged by the hospital.)

After her husband became a concert singer and actor Mrs. Robeson often toured with him, and has lived for periods in Paris, Vienna, Kitzbuehl in the Austrian Tyrol, Moscow, Barcelona, and London. In the summer of 1925 the Robesons left America for London, where the Negro actor was starred in *Emperor Jones*. Living in Chelsea, they enjoyed the unsegregated, easy atmosphere of London, which reminded them of their "beloved" Greenwich Village in New York. When the play closed they went to the Riviera, and there in a little French-Italian town they spent much time with American friends—Glenway Westcott, Emma Goldman, Claude McKay, Max Eastman. After their return to America for a concert tour, their son Pauli was born on November 2, 1927. Six months later Robeson's engagements again took the family to London, where the singer appeared in *Show Boat*. This time they re-

ROBESON, ESLANDA GOODE—*Cont.*

mained in Europe for more than ten years, returning home finally late in 1939.

Throughout these years Eslanda Robeson led a busy life, attending to the details of her husband's work and pursuing several studies that interested her. In 1930 her first book, *Paul Robeson, Negro*, was published. Critical reaction to this biography was varied, most reviewers remarking upon the naïveté and simplicity of the narrative. Langston Hughes '40 called it a book that "couldn't have been bettered by the best press agent," while Stark Young mentioned the volume's "mediocrity." Mrs. Robeson has also done research on the theater, films, and radio at Cambridge and Malvern in England, and at Columbia in the United States. But most fascinating to her has been her work in the field of anthropology.

Specializing in the subject of Africa, the Negro and, later, all colored peoples, Mrs. Robeson studied anthropology at London University and at the London School of Economics from 1935 to 1937. She read all the pertinent material she could find in the libraries of these institutions and in the British Museum and House of Commons libraries while studying under such teachers as Malinowski '41, Firth, Perry, and Hocart. This work stimulated her latent desire to visit Africa—even as a child she had wondered about the "old country"—and finally in 1936 she decided to undertake the pilgrimage to the homeland of her ancestors. Thus she set out on a kind of anthropological field trip to observe for herself the peoples and countries which had been loosely labeled "primitive" and "backward." Since she quickly discovered that visas for Negroes to visit Africa were difficult to obtain, Mrs. Robeson cited her studies and desire for practical research as the reason for her journey. Accordingly, with her young son she boarded the S.S. *Winchester Castle* and started on the travels which were to cover a continent and result in *African Journey*, published about nine years later, in 1945.

After her eventful trek through Africa Mrs. Robeson and Pauli returned to England. During the Spanish civil war Mr. and Mrs. Robeson visited Spain as guests of the Loyalist Government, and the Negro sang for the soldiers on the battle lines near Madrid. In November 1939 the Robesons returned to America, where Mrs. Robeson continued her studies at the Hartford Seminary Foundation. August of 1945 saw the publication of *African Journey*.

African Journey was accorded a favorable critical reception, with the reviewers in general agreement with Ernestine Evan's description of the book as "an excellent tourist account as well as a treatise on the color line." The *Library Journal* states that Mrs. Robeson "shows that, for the first time since the colonization of Africa, the peoples of the world must take account of the people of Africa." "She writes as a wife and mother," comments Lewis Gannett '41, "which gives her story a kind of warmth and intimacy rare in travel reports from Africa." In an otherwise favorable review, John Latouche '40 (*Saturday Review of Literature*) says, "Sometimes the points she makes are extreme, and occasionally her statements are traditional rather than exact." The New York *Times* critic found the book "an extremely attractive and natural book," while Stuart Cloete declared, "She has written a very interesting book—the first, I think, of its kind, and one which should make the white South African wonder sometimes, if he never did before, what those whom he calls his servants think of him." Cloete mentions that the book is "biased in favor of the black man. But almost every other African book is biased in favor of the white."

In *African Journey* the author depicts the oppressive yoke under which the millions of black Africans live. In the words of one writer, "the evidence of manipulation and exploitation is exposed by her as any Jeffersonian might have exposed it. . . .Her book may not be the most tactful and diplomatic ever written, but through its lively travelogue it transmits a clear and ringing denunciation of capitalism's tendency to rob the blind of their pennies." Mrs. Robeson found the Africans "far more politically aware" than her fellow Negroes in America. These people were eager to learn about interracial progress in the Soviet Union, a subject which the anthropologist discussed from first-hand experience. Mrs. Robeson is convinced that racial inequality all over the world is part of one and the same problem, "not a black problem, but a white problem, created by the behavior and attitudes of white people toward the darker races." One critic noted her belief that "what educational and economic advantages have done for her they will do for other Negroes." (Several reviewers spoke of the impressive photographs, taken by the author herself to illustrate her book.)

Living in Enfield, Connecticut, Mrs. Robeson has been an active worker in the Red Cross Motor Corps and, as always, a militant partisan in the cause of the Negro. She has lectured widely on race relations and in late August of 1945 joined the staff of the Council on African Affairs. Her articles on the Negro and Africa have appeared in *Asia and the Americas*. Engaged in the summer of 1945 in the preparation of a new book, Eslanda Robeson was also planning two projects with Pearl Buck. She recently told New York *Post* writer Mary Braggiotti of her hopes in this connection: "First, we are going to work for a Federal bill for a minimum standard of education in this country. Education is not universal; it isn't free. Americans were shocked at the Army statistics of illiteracy. Second," continued Mrs. Robeson, "we would like to get a Federal bill to the effect that any public service must be really public or else it cannot have a public license."

Eslanda Robeson is described as a woman of great vitality and warmth, "vivacious, spirited, bubbling with ideas." She is accounted an excellent swimmer and at one time was a star basketball forward. When she has the time she enjoys bowling with her son and his friends in the recreation house of their large Colonial home, The Beeches. Pauli was educated largely in England and the Soviet Union and in 1945 was a student at Cornell University.

ROCKWELL, NORMAN Feb. 3, 1894- Artist

Address: Arlington, Vt.

If the American public were asked to choose their best-loved painter, it has been said that they would vote "either for Norman Rockwell or, through error, for Rockwell Kent '42." (Another illustrator, Douglass Crockwell, avoids being mistaken for Norman Rockwell by signing his pictures "Douglass.") Unlike the artist-explorer Kent, Norman Rockwell has no interest in landscapes; his tremendously popular illustrations have led one writer to remark, "In reality Mr. Rockwell is a portrait painter, although he never has styled himself such. . . . He paints his portraits for millions to see and enjoy rather than for the occasional visitor to a stately drawing room."

Norman Rockwell was born in New York City on February 3, 1894, the elder of two sons. His father, J. Waring Rockwell, an amateur artist, was what his son calls "an old retainer" of a Philadelphia cotton-goods concern whose New York office he managed; Norman Rockwell is quoted as saying that his father's salary was "so small he was ashamed of it and he never told us how much it was, but I've never in my life seen anyone more devoted to a business firm." Norman's mother, Ann Mary (Hill) Rockwell, was the daughter of William Hill, an English portrait painter who lived in Yonkers, New York, where he put his twelve children to work on landscapes, in assembly-line fashion.

When Norman was ten the Rockwells moved to Mamaroneck, New York. He early showed his love of drawing, and at thirteen he was allowed to enroll at the Chase School of Art for lessons twice a week. (At the same time, of course, he continued his ordinary schooling.) Later Norman was sent to the National Academy of Design, where he and two other boys signed in blood a vow never to make more than fifty dollars a week and to strive for the highest in art. At sixteen Rockwell left the second year of high school to enter the Art Students' League, where he won two scholarships and studied under George Bridgeman and Thomas Fogarty. His fellow students soon nicknamed him "The Deacon" for his solemnity. (According to Rufus Jarman in the *New Yorker*, Rockwell and a friend had their first studio when he was sixteen, but had to move to another when Norman's father came visiting and saw the dubious nature of the building.)

NORMAN ROCKWELL

Through Fogarty, the seventeen-year-old painter got some assignments from Condé Nast to illustrate McBride and Nast publications. The first of these was an historical work on Champlain; next came a children's book, *Tell-Me-Why Stories*, and a volume on camping by Edward Cave, editor of the Boy Scout magazine, *Boy's Life*. According to Jarman, this latter won him a canoe and, shortly afterward, a fifty-dollar-a-month position as Cave's art editor. This meant that he painted most of the covers and illustrated two or more stories each month. Young Rockwell added to this income by doing illustrations for *St. Nicholas, American Boy*, and a children's monthly, *Everyland*, as well as for some books by Ralph Henry Barbour, including *Onward and Forward, The Crimson Sweater*, and *Four Afloat*. After a rest, he moved to New Rochelle, New York, to devote all his time to free-lance illustrating. In those days, he recalls, "you offered your stuff to the *Saturday Evening Post* first, then to the old *Life* Magazine, *Leslie's*, and the others in regular order. If we couldn't sell a drawing anywhere else we shipped it out to Des Moines to the *People's Popular Monthly*. They bought everything, and paid fifty dollars for each drawing, good or bad."

After five years of free-lancing Rockwell seemed not to be making very much progress.

ROCKWELL, NORMAN—*Continued*

It was the cartoonist Clyde "Vic" Forsythe, with whom he shared a studio, who persuaded Rockwell in 1916 to submit a magazine cover to the *Saturday Evening Post.* Forsythe vetoed Norman's first sketch, of a gracious prima donna, as "not his kind of work." Then, as later, Rockwell found himself unable to draw any but homey women. ("Lord knows I used to try to be sexy," Jarman quotes him, "but when I'd finished they all looked like fine wives and mothers." "I can draw a pretty girl," he has said elsewhere, "but I've never had to.") So Rockwell put some of his "kid stuff" into cover form and took the results to Philadelphia, where George Horace Lorimer accepted all four for about seventy-five dollars each. Lorimer is said to have been so impressed by Rockwell's work that he issued an order that all would-be contributors should be made welcome. Since his first sale to the *Post* Rockwell has sold them an average of ten covers every year, in addition to numerous drawings for the inside pages.

As soon as his pictures were accepted the artist wired his fiancée, a girl from upstate New York, and they were married. The first cover by Rockwell appeared in May 1916. It showed a disgusted boy pushing a baby carriage while his jeering friends went off to play baseball. Since then Rockwell has specialized in such "subject pictures" of the more endearing ages of man (babies, children, "the calf-lovers, the young gentleman, and the codger"), drawn with great and realistic detail. Over the first hurdle, the twenty-two-year-old illustrator gave up the regular income from his other illustrating to devote himself entirely to developing the more remunerative magazine covers for the *Post, Literary Digest,* and the old *Life,* and similar pictures for advertising. A year later, when the United States entered the First World War, Rockwell enlisted in the Navy, becoming a first-class painter and varnisher; but the commandant of the Charleston Navy Yard kept him there working on naval portraits. The magazines also got special permission for him to continue his work on "timely subjects of strong patriotic appeal," so that his income was considerably larger than the commandant's. When the Armistice was signed Rockwell procured an immediate discharge on the one possible ground—inadaptability.

In 1922, when Rockwell was twenty-eight, he took his first trip abroad and had his first chance to study the masterpieces in European galleries. Several friends of his student days tried unsuccessfully to convert him to the New Art, for they were scornful of the "commercialization to which he had descended"; but before he left (because there were not enough typically American subjects for him to work on) several of the scorners asked him whether he thought there would be a good market for them in advertising art back in the States. On several later trips to Paris, Mr. and Mrs. Rockwell engaged in "a mad social whirl." Rockwell's income, mainly from advertisements, was then about forty-five thousand dollars a year. He built an expensive house in New Rochelle and an eighteen-thousand-dollar studio, which he describes as "a mess." "I built it," he says, "at the height of the antique craze, and it was patterned after the Wayside Inn at Sudbury. Everything was imitation antique." Others were less critical, including *Good Housekeeping* Magazine, which published an article on the Rockwell home entitled "A House With Real Charm."

The Rockwells were divorced in late 1928, and Norman moved back to New York. In 1929 his friends persuaded the thirty-five-year-old artist to take up dynamic symmetry, which is based on a theory that all paintings can be reduced to converging straight lines. Rockwell experimented with it for two years before deciding that it was unsuited to the cover dimensions of the *Saturday Evening Post.* After the 1929 crash he went to California for a vacation and was introduced to Mary Rhodes Barstow, a twenty-year-old schoolteacher of San Gabriel. Ten days later they were engaged, and in April 1930 they were married and went to live in New Rochelle.

In 1932, when their son Jerry (Jarvis Waring Rockwell) was six months old, Rockwell suddenly decided to study in Paris, and two weeks later they sailed. "I was about thirty-eight at the time," the painter recalls, "and thought I ought to get into abstractions, whatever they are." This attitude "bewildered the instructors at several Paris art schools, some of whom said frankly that they didn't know what they could teach a man who got as much for two or three magazine covers as they made in a year. He stayed in Paris seven or eight months, painting, among other things, two abstract covers for the *Post,* which the editors gamely printed. 'My best efforts,' he recalls, 'were some modernistic things that looked like very lousy Matisses[43].' . . .To the great relief of the *Post,* he then settled back into his old groove."

That groove included "standing head and shoulders above almost all others in depicting scenes from his country's Colonial days," to quote the *Ladies' Home Journal* of February 1939. A year earlier *Judge* Magazine had given its High Hat Award to "Norman Rockwell, artist, illustrator, raconteur," for eleven reasons, including "having become, while still a young man, a tradition in art . . . for having painted one of the country's finest murals in the Nassau Tavern at Princeton; for having . . . proven that careless modernization is not a part of good craftsmanship; for having been the inspiration for a school of drawing . . . for his encouragement given to aspiring young artists . . . for his youthful enthusiasm for and curiosity about all things." Rockwell has never liked to paint advertisements, and nowadays extra-*Post* work is confined mainly to the official Boy Scout calendars, which he has painted for Brown and Bigelow nearly every year since 1920 and which have been the Nation's best-selling calendars since the beginning of the 'forties. By 1945, however, Rockwell was running out of good deeds to portray.

Rockwell has illustrated some books, notably de luxe editions of Mark Twain's *Tom Sawyer* and *Huckleberry Finn* in the mid-'thirties. It was while doing research for these in Hannibal, Missouri, that the artist first began to use photographs instead of relying entirely on sketches from the model. Rockwell claims to be the first illustrator to admit that he was using photographs, a nearly universal practice. "I don't suppose anyone will follow my advice," he says, "but it is better not to use photographs until after you have proved your ability to get along wholly without them," and Rockwell himself makes one illustration out of every four or five without the camera, to make sure that he still can. After the preliminary sketches comes a complete full-size charcoal drawing from life, and a smaller color sketch. Then Rockwell traces the charcoal drawing on to the final canvas and is ready to begin the painting, a stage lasting anywhere from two weeks to two months, during which he sometimes gets stage fright. When painting Rockwell wears bifocal lenses divided perpendicularly so that he can look alternately at the models and the easel. During this stage Mrs. Rockwell reads to him, and they have thus gone through "most of the best sellers published in the last thirty years, besides the complete works of Tolstoi, Dickens, Henry James, Voltaire, and Jane Austen." Then, says Rockwell, "I wrap the picture up and send it in and pray."

Seldom is a Rockwell picture refused. Jarman reports that nothing else in the *Saturday Evening Post* draws as consistently large a public response as Rockwell covers; that in 1945 the editors were still receiving requests for copies of a picture published sixteen years earlier; and that the first of his annual April Fool covers, in 1943, brought in a hundred and forty thousand letters. Rockwell attributes much of his appeal to his realism, based on the use of genuine models and properties. His home in Arlington (Vermont) is furnished mainly with Victorian and early American items he has used in his pictures. (Rockwell moved to Arlington, where he had been spending the summers, after having more or less used up his New Rochelle neighborhood as a model source.)

The artist finds many potential models at the weekly square dance of the West Arlington Grange (he is a Grange officer) and has had so many of the townspeople pose for him that "the feeling in town is that a person hasn't arrived until he has posed for a Rockwell painting or at least served as a critic for one. When the artist is having trouble with a picture, he is likely to call in anyone who happens by and ask what is wrong with it. . . . 'If they don't understand the story I'm trying to tell,' he explains, 'I figure that I haven't made it clear enough and that a lot of other people around the country won't understand it, either.'" When Rockwell's studio burned down in 1943, destroying a huge and irreplaceable collection of costumes, paints, brushes, reference materials, old guns, prints, and paintings, the artist "put it all down." *My Studio Burns Down* appeared in the July 17, 1943, *Post* as a double-page spread; but his next studio was equipped with several fire extinguishers and a fireman's hat and ax, and his new house (he sold the old one) has a sprinkler system. The studio, incidentally, is kept with a neatness phenomenal among painters.

Despite his immense popularity, Rockwell is dismissed rather lightly by the "art artists," who look down on illustration and on "pleasing the public." *Time*'s critic holds that "Rockwell would probably be incapable of portraying a really evil human being, or even a really complex one—perhaps even a really real one. Though he paints and composes exceedingly well, it is questionable whether any of his work could be seriously described as art. Even the celebrated Four Freedoms posters fall short of artistic maturity through their very virtue as posters: they hit hardest at first sight. But as a loving image of what a great people likes to imagine itself to be, Rockwell's work has dignity, warmth, value." The New York *Times* has compared his work to the writings of Mark Twain and Booth Tarkington. George Grosz, a "serious" painter, says firmly that Rockwell has "excellent technique, great strength, and a clearness of touch that the old masters had. His things are so universal that they would be appreciated anywhere." And one admirer demanding to know why *Time* said Rockwell's paintings were not art, wrote: "Is it because Rockwell is commercial? . . .If so, would you say that the work of Michelangelo, Franz Hals, and Velásquez is also not art? They did their stuff to order for the Popes, Medici, burghers, and princes. . . .Is it because Rockwell enjoys detail? If so, where does that put Vermeer, Dürer, and Holbein? Is it because he puts the light of beauty ('sweetness,' if you like) into the tired and commonplace? And if so, where does that leave Raphael, Corregio, Botticelli, and Company?" In a defense of his brother illustrators and himself, as presented in a *New Yorker* "Profile," Rockwell declared illustration to be as much an art as any other form of painting, one which presented the artist with even more limitations and difficulties. He finds particularly confining the necessity to present the story clearly, within the limits dictated by the size and shape of a magazine page.

Norman Rockwell, six feet tall and dark, is described as "stringy, boyish, only moderately craggy . . . with a long nose, an active Adam's apple, deep-set, melancholy brown eyes, and a good-natured air." His only recorded vanity is buying his shoes too small. The Rockwells rise at six-forty-five, and Norman keeps regular "office hours" at his studio. He works himself to the edge of a breakdown, then snatches an immediate vacation, normally in Europe. "Handsome, charming" Mrs. Rockwell learned to bicycle and to play baseball so that she could join her husband and their sons, Jerry, Tommy, and Peter, at their play, and she is said to "pitch a mean curve." Rockwell seldom returns to his native New York except to deliver a picture and see a play; a succession of untoward events discouraged each of his past attempts to re-enter its "sophisticated chaos." He does address the annual meeting of the Society of American Illustrators, and is said to be its most popular speaker. He is a member also of the Free Lance Artists of America, and during the Second World War, of the local Civilian Defense Unit and of a War Artists Unit sketching sick and wounded men in service hospitals. Asked by an interviewer what he would rather do, see, and be than anything else, Rockwell answered succinctly, "Paint", "Fine Paintings;" and "Great Painter."

ROMBERG, SIGMUND July 29, 1887- Composer; pianist

Address: b. c/o ASCAP, 30 Rockefeller Plaza, New York City; h. Beverly Hills, Calif.

Often called the American successor to Johann Strauss, Hungarian-born, Viennese-educated Sigmund Romberg brings a nostalgic flavor to his lilting melodies which Americans have been humming for a quarter of a century. One of the most prolific writers of popular music, he has composed, in thirty years, the scores for more than seventy musical shows, a total of some two thousand songs. In the history of the New York stage he is the only composer who has had three shows which have each seen more than five hundred performances on Broadway, namely, *Blossom Time* (1921), *The Student Prince* (1924), and *The New Moon* (1928). *Up in Central Park,* the 1945 musical with a Romberg score, has made the hit class largely because the music is "lush and singable."

SIGMUND ROMBERG

Szegedin, in Hungary, is the birthplace of Sigmund Romberg. He was born there July 29, 1887, to Adam and Clara Romberg. In his family were musicians and writers: his father, a chemical manufacturer, was an amateur pianist of no little ability, while his mother, under the name of Clara Berg, was a well-known novelist; the world-famous Alfred Grünfeld was a cousin of his father's, as was Adela Strauss, wife of Johann. At the age of seven Sigmund began to take violin lessons; he was taught by his father to play the piano, and before long he was able to play several other instruments, including the cello, trumpet, and drums.

After attending schools in his native Hungary, young Romberg went to Vienna to finish his education. There his work in school orchestras and bands attracted the attention of Richard Heuberger, conductor of the noted Wiener Männergesangverein, a men's choral body. Under Heuberger's guidance the fourteen-year-old Romberg, who had never attended a school of music, began the study of theory, harmony, and counterpoint. At sixteen he wrote his first composition, a march called "Soldiers of Mercy," which he dedicated to the Grand Duchess Clotilde, Red Cross patroness in Austria. His pronounced talent for music notwithstanding, Romberg enrolled in the Vienna Technische Hochschule to study civil engineering—but his leisure hours were spent in Vienna musical circles. In 1907 Romberg's engineering course was interrupted by Austria's compulsory one-year army training. At the end of the period a Balkan disturbance occurred, and for nine months Romberg was on border patrol duty. At the end of his military service it was decided, in family conference, that he might go to the land of "boundless opportunity"—America.

The three hundred dollars which his family had provided for the venture were soon gone, and Romberg, who spoke very little English, was glad to accept a seven-dollar-a-week job with the Eagle Pencil Company in New York City. Penniless on his fourth day at work, he borrowed twenty-five cents for a meal at a Second Avenue cafe, which in that year of 1910 offered a heaping plate of Hungarian goulash, a stein of beer, and music by a string quartet. While there the young foreigner engaged the orchestra leader in conversation, the result of which was a pianist job for Romberg at fifteen dollars a week, plus all the goulash he could eat during a working day.

The cafe was a rendezvous for musicians. Three weeks later the manager of Pabst's Harlem Restaurant, after hearing the young pianist play, offered him twenty-five dollars a week, and fried chicken in place of goulash. Before the year was out Romberg, who still could not speak English well, was earning forty-five dollars a week and had had his first composition, "Memories," published. After playing in a number of other cafes and restaurants, he decided to organize his own orchestra. At that period the most tiring job on the New York cafe circuit was that of entertainer in the famous Bustanoby's, whose doors were open from noon to five in the morning. Romberg, leading his own orchestra, not only survived the seventeen-hour grind of playing dance music, but while there composed three dance tunes: "Leg of Mutton," a turkey trot; "Some Smoke," a one-step; and "The Poem," a waltz.

J. J. Shubert, of the famed Shubert family, heard Romberg's work and immediately engaged him to write the musical score for the first Winter Garden show, *The Whirl of the World* (January 1914). The revue, starring Willie and Eugene Howard and the Dolly Sisters, ran for 161 performances on Broadway—establishing the reputation of Romberg and the Winter Garden shows. (In that era several prominent showmen produced annual revues: Florenz Ziegfeld did the *Follies*, George White, the *Scandals*, and the Shuberts, the *Passing Show*, which was always presented on the Winter Garden stage.)

Romberg contributed to, or was solely responsible for, the scores of the *Passing Show* of 1914, 1916, 1917, 1918, 1919, 1923, and 1924, and before he left the Shuberts in 1925 he had written scores for twenty-three other musical shows which the brothers had produced. Among the stars who appeared in these productions were Al Jolson '40, Ed Wynn '44, John Charles Thomas '43, Clifton Webb '43, Nora Bayes, Marilyn Miller, Vivienne Segal, Eleanor Painter, Peggy Wood '42, Leon Errol, DeWolf Hopper, the Dolly Sisters, and the Howard brothers. The composer's first major triumph came with his first operetta, *Maytime* (1917), a story of New York City in the early eighteen-hundreds. Although the press was divided on the merits of the production, the operetta proved so popular with the public that it remained on Broadway for 492 performances.

In 1919 Romberg formed his own producing firm with Max R. Willner, but the actors' strike that same year proved to be the undoing of this venture. As a result, the composer returned to the Shuberts, under whose banner in 1921 he wrote what has been the most successful production of his career so far—the operetta *Blossom Time*. In its first Broadway presentation it played 509 performances, and it was revived in 1926, 1931, 1938, and 1943. In between and during these Broadway engagements numerous companies brought the operetta to the four corners of the earth. Its book, written by Dorothy Donnelly, concerned the love story of Franz Schubert; the score was Romberg's modernization of Shubert melodies, and included his adaptation of Heinrich Berté's operetta *Das Dreimäderlhaus* (1916), which was also based on Schubert music.

Another major hit of the Romberg-Shubert association was *The Student Prince* (1924), the Americanization of *Alt Heidelberg*. It ran for 608 performances on Broadway, and has been revived a number of times in the United States and other countries. After the 1943 revival, Howard Barnes of the New York *Herald Tribune* reported that its most popular numbers, "The Drinking Song," and "Deep in My Heart, Dear," were as excitingly stirring as they had been two decades before. In October 1945 *Variety* noted that the "tuneful perennial drew $22,000" in Detroit the previous week. Shortly after the *Student Prince* Romberg left the Shuberts. His first smash hit under new management was *The Desert Song*, produced in 1926 by Lawrence Schwab and Frank Mandel. This operetta had been written in collaboration with Mandel and its book and lyrics were by Schwab, Otto Harbach, and Oscar Hammerstein 2d '44.

The peak of Romberg's prolific output came in the year 1927. With *The Desert Song* still playing on Broadway, *My Maryland* was presented. (This work Romberg calls his favorite, although it never achieved the long run that some of his other operettas did.) In addition to these two, in the year 1927 Broadway audiences heard Romberg scores in *My Golden Girl*, *Cherry Blossoms*, *Bonita*, *My Princess*, and *Rosalie*. The last, a Ziegfeld musical written for Marilyn Miller, was "tossed off" by Romberg in collaboration with George Gershwin, while both composers were engaged in doing the scores for other productions. Romberg was in the midst of working on *The New Moon* and Gershwin was doing *Funny Face*, which starred Adele and Fred Astaire. *Rosalie* opened the same day as the other two shows, although in a different city, leaving the composers "up in the air trying to keep track of them."

The show with which *Rosalie* competed, *The New Moon*, was another Schwab and Mandel production with Hammerstein lyrics. It was produced in 1928 and turned out to be the composer's third show to pass the five-hundred mark on Broadway. On its revival at the New York City Center in 1944 critics called the Romberg score the show's greatest asset. "There is no denying," declared the New York *Times*, "that when he set it down he was writing the Hit Parade of 1928, and as well writing songs which have not been forgotten." These were "Softly as in a Morning Sunrise", "One Kiss", "Wanting You," and the song Romberg has called his favorite, "Lover, Come Back to Me." When this 1928 hit was played in between national anthems at the San Francisco Conference, according to a report in the New York *Times*, "everyone rose to his feet in fitting tribute." (*Oklahoma*! the 1943 Richard Rodgers '40-Oscar Hammerstein show, is the first musical to equal *The New Moon* in its number of hit songs.) The 1944 critics pronounced the book, with its pirates and revolutions, "drearily out of date." Hammerstein and Romberg collaborated on nine other productions after *The New Moon*. Among these were *East Wind* (1931), which closed after only thirty-one performances; *May Wine* (1935), a comedy about Hollywood which ran for 213 performances; and *Sunny River* (1941), the music of which was described by the New York *Times* as "ponderous and pedestrian."

With the advent of musical motion pictures, Hollywood sent for Romberg in 1929. It was to be a happy collaboration, for, although the composer has continued to contribute to Broadway musicals, he has established his home in Beverly Hills and casts his vote in California elections. Among the screen musicals on which he has worked in the succeeding two decades are *Viennese Nights* (1930), *The Girl of the Golden West* (1930), *Children of Dreams* (1931), and *The Night Is Young* (1935), as well as the adaptations of three of his operettas, *Maytime* (1937), *The New Moon* (1940), and *The Desert Song* (1943). In 1933 Romberg went to Paris to write the

ROMBERG, SIGMUND—*Continued*

music for an original operetta, *Rose de France*, which was produced by the Société Anonyme Française Chappell.

Although the composer has often appeared on the radio, until 1945 he had only one sponsored air series, a program for Swift and Company in 1934. In an interview with *Newsweek* at that time Romberg confessed that he preferred movie to radio work. "In Hollywood," he said, "if you ask for three military bands, they give them to you—in radio it's hard to create an effect. All you get is four blank walls." Moreover, he found that his weekly broadcast demanded all of his time—two new tunes a week and five-hour weekly rehearsals. In the summer of 1945, however, Romberg returned to radio, and "An Evening with Romberg," sponsored by Raleigh Cigarettes, was a weekly half-hour feature, offering twenty minutes of his own selections. The program was continued, except for a brief vacation, until the late autumn when Romberg planned an extensive concert series. He has said that he finds the preparation of a radio program, with its problems of timing and of gratifying the sponsor's mood, to be "infinitely more exertion than a cross-country concert tour."

In 1942 Romberg began a new venture. Acting on his theory that people were a little tired of hearing jazz or serious music at concerts, he contracted to conduct six concerts in Eastern cities, a program called *An Evening With Sigmund Romberg*. The program naturally contained much Romberg music, but there were bits of Jerome Kern '42, Gershwin, Lehár, and other "standards" in the "pop" concert repertoire. The six concerts, scheduled for the last months of 1942, had become 277 in 128 cities by January 1944, and had made over seven hundred thousand dollars. Louisville, for example, heard the program five times. On his tours the composer was accompanied by a forty-five-piece orchestra and several soloists. His conducting was described as unorthodox, "everything geared to a nice relaxation." In concerts he gave at Army and Navy camps, Romberg says, he sang some of his own tunes, although he has no singing voice. The presence of the composer seemed to please the men, he felt. The wide appeal of his work was again evident in July 1945, when Romberg, leading the Philharmonic-Symphony Orchestra, attracted an audience of fifteen thousand to the Lewisohn Stadium in New York City, to enjoy "an evening of music in the old Vienna manner."

Up in Central Park (January 1945), Romberg's first Broadway production in many seasons, became a "sellout" in its first weeks on Broadway, despite a diversity of critical opinion on its merits. It is the story of how New York's "ugly Back Yard" became the famous Central Park of today only because its development offered "Boss" Tweed of Tammany a rich opportunity for swindling the taxpayers. Like Romberg's first operetta, *Maytime*, it is set in the eighteen-hundreds—a blend of fiction and history. The book (by Dorothy and Herbert Fields), Lewis Nichols of the New York *Times* said, "plods where it should dance," while the score, though pleasant enough in a nostalgic fashion," with several good songs, "It Doesn't Cost You Anything To Dream", "Close as Pages in a Book," was not varied enough. Ward Morehouse '40 pronounced the score "first rate" and the comedy "weak." The New York *World-Telegram* reviewer, Burton Rascoe, put the show on the "must list," hailing Romberg as "the master melodist." According to Diana Gibbings, in the New York *Times*, Romberg says that it takes him about ten to twelve weeks to write a score. "My wastebasket is full of discarded tunes, but one has to shake off a failure like a dog shakes off water."

In the past ten years the composer has given much of his time to organization work. He is a member of the ASCAP board of directors and is president of the Songwriters Protective Association. During the time he has held the latter post (1932 to 1936 and since 1942), he has worked to establish a closed shop for the songwriters. A closed shop for free-lance composers is maintained through an agreement between a songwriters' association and a publishers' association in which each has agreed to do business only with members of the other association on minimum basic terms for all song rights. Romberg has also worked for better copyright protection for the members of SPA. He has stated, "We want the same protection that England gives its writers—a copyright which does not expire until fifty years after the death of the owner." He is also working for 50 per cent royalties on television rights, because, he explains, "there's no telling how far this new medium will go."

Romberg was married to Lillian Harris in 1925. The Rombergs, who have maintained New York apartments at different times, regard Beverly Hills, California, as their permanent home. The most prominent feature in their house is the library, which holds more than five thousand volumes—original manuscripts, first editions, operas, and operettas—one of the most important libraries of its kind in the world. A combination organ-piano greatly aids the composer in his work, for which he finds most of his inspiration in the early hours of the morning. Stoutish, bald, and genial in manner, he was once described by a writer as a "Viennese burgher." Romberg requested that the characterization be changed to "Viennese boulevardier," which, considering the composer's keen sense of humor and the dancing quality of his melodies, seems a more fitting description.

ROPER, ELMO (BURNS, JR.) July 31, 1900- Marketing consultant; public opinion analyst; United States Government official
Address: b. Elmo Roper, 30 Rockefeller Plaza, New York City; h. West Redding, Conn.

Blackstone Studios

ELMO ROPER

The closest estimate of the popular vote in three United States Presidential elections has been that of Elmo Roper, market researcher and public opinion analyst. In the words of *Fortune* Magazine, whose monthly surveys he conducts, "Not only has Mr. Roper been one of the first to create a technique for the scientific sampling of the public mind, but he has also contributed perhaps more than any other individual to the development of a rationale for that technique. . . .Today, thanks largely to the thinking of Mr. Roper, public opinion research holds an important place among the social sciences."

Like his friends and closest rivals, George Gallup '40 of the Gallup Poll and Archibald Crossley '41 of the Crossley Rating, Elmo Burns Roper, Jr., was born in a small town. His birthplace was Hebron, Nebraska, and the date was July 31, 1900. The son of Elmo Burns and Coco (Malowney) Roper, young Elmo spent a fair portion of his early years asking people not to call him Elmer—still his "pet peeve." Graduated from Hebron High School in 1918, Roper attended the University of Minnesota for one year. Urged by a Scottish grandmother, he went to Scotland to study moral philosophy at the University of Edinburgh. But the youth never got his degree, for in 1921 he returned to the United States and opened a jewelry store in Creston, Iowa. By June 1922 he was sufficiently well established to be married to Dorothy C. Shaw. (The Ropers have two sons, Burns Worthington and James Jeremy.) A member of the local businessman's associations, Rotary, the Chamber of Commerce, and the Iowa Retail Jewelers' Association, in 1927 Roper became president of the latter.

Nevertheless, the young jeweler's store was not quite so successful as he thought it should be. Analyzing the situation (as Beverly Smith tells it in the *American* Magazine), the jeweler discovered at twenty-seven that he was trying to sell jewelry he liked, instead of the kind his customers liked. Roper investigated his neighbors' preferences and then decided he did not want to sell "the kind of jewelry the Iowa farmers liked." So he gave up his store in 1928 and took a job as salesman for the Seth Thomas Clock Company, later becoming associated with the New Haven Clock Company, and then with the Traub Manufacturing Company of Detroit, Michigan.

Remembering his Iowa experience, Roper constantly quizzed his customers as to their likes and dislikes in clocks. With this information as a basis, he continued to make a fine sales record throughout the depression, and was promoted to sales supervisor and assistant sales manager. In 1933 he gave up selling to enter marketing research in New York, where he went into partnership the next year with the marketing expert Paul T. Cherington and the writer Richardson Wood—establishing themselves as Cherington, Roper and Wood, distribution consultants. Roper devoted himself to taking polls of public taste for the firm's clients in private industry, and developed a sampling technique which utilized a relatively small number of subjects, carefully selected to be a representative cross-section of the group surveyed.

In 1935 Henry Luce '40 engaged Roper's firm to conduct the *Fortune* surveys of public opinion, to be published that July and quarterly thereafter. (Since July 1938 the surveys have appeared in nearly every issue.) The next year Cherington, Roper, and Wood parted company, Cherington and Roper remaining partners until November 1, 1937, when Roper went on alone. The 1937 Presidential election first brought Elmo Roper to the public's attention, as it did Gallup and Crossley, who had independently worked out "economical and apparently scientific methods of polling a small, representative cross-section of the population." That year the celebrated *Literary Digest* straw vote showed an easy prospective victory for Alf Landon '44 in his Presidential race against Franklin D. Roosevelt '42. Gallup and Crossley each predicted that the Republican would win about 54 per cent of the popular vote, and listed a num-

ROPER, ELMO—*Continued*

ber of states for Landon, while Roper's findings led him to predict a Roosevelt victory, with 61.7 per cent of the popular vote, opposed only by the northeast section of the country. But Democratic National Chairman James A. Farley['44], hit the bull's-eye when he announced that Landon would carry only Maine and Vermont. Roosevelt won with 60.7 per cent, a result which differed from the *Literary Digest*'s figure by 19 per cent, from Crossley's and Gallup's by nearly 7 per cent, and from Roper's *Fortune* survey by only 1 per cent. This had two effects: it contributed to the decline of the *Literary Digest*, and established the three poll-takers as national oracles.

Forecasting elections is perhaps the least important aspect of survey work; Roper himself calls it "a socially useless function," admitting ruefully that "those of us who have stuck our necks out in election predictions are expected to keep on doing so." Yet such forecasts have an importance in that the whole world is interested in a Presidential election, while much opinion research is necessarily private, even secret; market research is at best dull to the outsider. Even a local election offers a chance to measure the surveyor's accuracy, test new techniques, and demonstrate his trustworthiness. In 1940 his was the most accurate forecast in the Presidential election, with a statistical error of one-half of 1 per cent. (Gallup's was 3 per cent; Wall's missed by 2 per cent; and Emil Huria and William L. Crum each predicted a Willkie['40] victory.) In that election, for the first time, CBS had Roper analyzing voting trends over the air. The prestige of the surveys had reached such heights that at least one Congressman (Walter M. Pierce of Oregon) claimed that the surveys influenced elections by creating a "bandwagon vote," thus opening a way for "private manipulation of public opinion for profit." This all three leading researchers deny, although they agree that their survey results probably (and properly) influence legislative votes. Roper goes further; he thinks the Federal Government should establish its own poll, on much the same basis as the Supreme Court, to determine the public's opinion on the issues before it.

Roper's surveys—which, like most leading statisticians', are considered "absolutely honest and scrupulously impartial"—are made in a somewhat different manner from most others. He has the smallest staff of interviewers (one hundred and fifty-six, to Gallup's eleven hundred and Wall's four thousand). He polls the smallest number of people. His interviewers, however, are intensively trained, while Gallup employs business and professional people who work for him only a few hours a week. Each Roper worker in a given area is assigned to interview a given number of men and women, of whom an assigned number is to be in each age group, each income group, and each occupational group, plus whatever other factors the survey may call for. As Dorothy Dunbar Bromley comments, "Interviewers have to be good at acrostics." In addition to the monthly *Fortune* survey, Roper's staff carries on research for an impressive list of private clients, which includes the Columbia Broadcasting System, the Standard Oil Company of New Jersey, Spiegel, Inc., and the American Meat Institute.

In February 1941, ten months before Pearl Harbor, Elmo Roper became a dollar-a-year man as a member of the Advisory Committee to Donald M. Nelson['41] in the Purchases Division of the Office of Production Management, which later became the War Production Board. In addition, that July Roper was appointed deputy director under Colonel William J. Donovan['41] of the Office of the Co-ordinator of Information; and when the Office of Facts and Figures was formed in October, with Archibald MacLeish['40] as head, Roper was made a member of the Board of Governors. At the same time, the remaining services of Donovan's COI were assigned to the new Office of Strategic Services, of which Roper was deputy director. (This office, which operated under the Joint Chiefs of Staff, was so secret that, alone among Government agencies, its accounts were not subject to auditing. With the war's end, its functions were transferred to the State Department.) Roper, whose research activities continued full blast, was made a director of Spiegel, Inc., at about this time, and was also elected to the board of Traub Manufacturing Company a few months afterward. Later that year Williams College awarded him an honorary M.A. degree. For several years Roper has also been on the faculty of Columbia University's Graduate School of Journalism as an assistant professor, giving occasional lectures.

During the pre-election period, beginning October 9, 1944, a large number of newspapers subscribed for Professor Roper's semi-weekly column *What People Are Thinking* through the New York *Herald Tribune* syndicate. The *Fortune* survey forecast a 53.6 per cent vote for Roosevelt, missing by only two-tenths of 1 per cent, to Crossley's 1.3 per cent statistical error, and Gallup's 1.8 per cent. (On Election Day night, in what promised to become a network tradition, CBS had Roper analyzing election trends, Blue had Gallup, and WOR-Mutual had Crossley.) Roper also delivered to the newspapers a post-election column not called for in his contract; and one week later he began a weekly series, under the same title, to be published in the *Tribune* and eight other newspapers.

The researcher had already written several magazine articles on public opinion, in which he stated several conclusions from his years of poll-taking. One is that, when intensity of opinion is measured, the women usually tend to take a moderate position, while the men usually choose the violent or extreme positions. (This fact contradicts the popular impression on the subject.) Perhaps Roper's most significant finding is that the common working-class man is often disappointingly uninformed about vital matters, but that "he is fundamentally possessed of a vast store of common sense." "Moreover," says Roper, "it has been my observation that when the public has enough of the facts to judge the probable result of any given action, it is likely to steer just as wise and fair a course as that plotted by any of its leaders. For this reason, I think the emphasis in public opinion research has been largely misplaced. I believe its first duty is to explore the areas of public ignorance."

Its second great function is "to report the opinions of the majorities on such matters as the public is, because of its knowledge, equipped to judge. For on such subjects the people have a sovereign right to be heard and to be heeded by their representatives."

His other conclusions Roper reported in a February 1942 *Rotarian* Magazine article, "What Americans Believe." "The second major conclusion I have arrived at," he wrote, "is that a way must be found, under some form of capitalistic society, to redistribute earning opportunity. The United States cannot continue to go forward with a system of dividing the rewards of industry [which involves] . . . a cumbersome system of taxes and organized charity [to rectify its injustices]. A more equitable distribution by industry itself is essential. This should be kept in mind as a postwar objective." And in February 1944 a Roper article stated that "in ten years of sampling the opinions of workmen—organized and unorganized, in all parts of the country and in all income brackets—we have discovered some remarkable common denominators of opinion. . . .From the answers to a great variety of questions we have been asking almost continuously since 1933, it is fair to assert that the American workman wants, first of all, *security*," which includes the right to work continuously at reasonably good wages, and also various additional forms, such as better education, pension plans, home ownership, etc. The second main desire is *a chance to advance*. "In this connection," Roper comments, "it would not be surprising if industry seriously considered the idea of educating its employees and their children." The third main demand is for *treatment "like human beings"*—that is, with politeness, friendliness, and consideration. And the fourth is *the desire to feel that one is making a real contribution*: 70 per cent of American workers say they feel a definite obligation to pass something on to the next generation. "Having set down these four great basic desires of the people in America who work for a living," says the analyst, "there seems very little left that cannot properly be included in one of these groupings. . . .The four desires are not in any sense mutually exclusive. . . . Yet it should be pointed out that in order to have some of each, the average workman seems willing to give up some of each." "In describing what labor wants," Roper concludes, "perhaps I have only been describing what everyone, everywhere, wants."

Early in 1945 one of Roper's columns in *What People Are Thinking,* which summarized results of surveys in recent years, caused Eleanor Roosevelt to comment in the New York *World-Telegram*: "He tells some of the curious quirks which illustrate our lack of information, or our complete misinformation on many things that most of us assume everybody knows about. One of the items which Mr. Roper picks out is that 51 per cent of our high school students, tested in one survey, were unable to name either of the United States Senators from their state." There are many other obvious things cited by Roper, concluded Mrs. Roosevelt, "which make one wonder whether the great majority of people really read their newspapers and whether, when they listen on the radio, they take in much of what they hear." *Time* called attention to Roper's own conclusion that many United States citizens were uninformed even about our closest Allies. Nevertheless, reports on polls during past months reflect an unusual degree of enlightened thought in general upon such immediate questions as a World Security Organization, Truman's handling of domestic problems, labor's strike record during the war, disposal of surplus property, use of the atomic bomb, Americans' attitudes towards Russia, and the United States Jews' stand on Palestine.

On the eve of the San Francisco Conference, Roper participated in a special radio broadcast and announced that his poll, just completed, of American opinion on the question of a World Security Organization revealed that 72 per cent of the population want to see the United States take an active part in an international organization. On the crucial problems involving the atomic bomb, Roper's poll reported in November that the majority of Americans approved of the use of the bomb, but believe they cannot keep the secret of the bomb for as long as five years. Almost 50 per cent of the people were of the opinion that the discovery had decreased the possibility of a future world war.

From the public opinion surveys he has conducted Roper has found that better informed persons were less liable to have strong prejudices resulting from misconceptions. "Racial and religious intolerance," he maintains, "can best be fought and overcome through facts. . . . The opportunity to attend school must be extended to an ever-increasing number of people, and more and better newspapers, magazines, radio broadcasts, motion pictures, and forums must be encouraged and supported."

This marketing-consultant-statistician-professor-columnist-official is a lean, quiet six-footer with curly brown hair parted in the middle, brown eyes behind rimless glasses, and a pleasant, thin-lipped face. Photographs seldom show him without one or more pipes, but he denies that he has a collection, or any other hobby or favorite recreation. "One might do me good," he smiles, "but I haven't got any." (This, according to psychologist Johnson O'Connor of the Human Engineering Laboratories, means that Roper is completely fulfilling himself in his work.) A Presbyterian and a Democrat (although he voted for Norman Thomas '44 in 1932), Roper is a member of several professional and social organizations, including the Masonic Order, and he was president of the Market Research Council in 1942-43. He is a member of the New York Housing Authority's Committee to Review Tenant Selection Procedure. Roper is described as an agreeable, frankly spoken man, who thinks of his work as an infant science about which there is still much to learn. He frequently meets with his chief competitors, Gallup and Crossley, for friendly shoptalks.

ROSENTHAL, JOE Oct. 9, 1911- Photographer

Address: b. c/o The Associated Press, Chronicle Bldg., San Francisco

Joe Rosenthal's photograph of the flag raising atop Mount Suribachi on Iwo Jima in February 1945 so stirred the American people by its drama that it became the official poster of the Seventh War Loan Drive, was reproduced millions of times in newspapers and magazines, was selected for the design of a commemorative postage stamp, and was awarded a Pulitzer Prize.

JOE ROSENTHAL

Born in Washington, D.C., on October 9, 1911, Joe Rosenthal is one of five sons of David and Lena Rosenthal, Russian immigrants to America. His father was in the clothing business. Much as any American boy, he became a Boy Scout and played with a Brownie camera, although he was not then interested in photography as a career. When his small size barred him from the football team at McKinley Technical High School in Washington, his interest in athletics made him join the track team. A pole vaulter who could vault eleven feet, he won his letter and several medals. Upon graduation in 1930, he left Washington to join his brothers in San Francisco, intending to work his way through the University of California. However, at this time he got no further than registering, because his job as office boy with the Newspaper Enterprise Association proved too interesting to give up. "When I got that job," he says, "N.E.A. might have meant National Education Association, for all I knew. I guess if it had been a grocery company, I'd be distributing groceries now." But his interest in photography had been aroused during his high school days, and N.E.A.'s San Francisco office became his training ground.

Two years later, wishing to attain the prominence of an occasional by-line at the head of a newspaper story, he became a reporter and photographer for the San Francisco *News*, covering police headquarters, the civil courts, and hospitals. In 1935 he became chief photographer of the Acme News Pictures' San Francisco bureau, and a year later he accepted the position of bureau manager with Wide World Photos, which he grinningly describes as "janitor and vice-president in charge of licking stamps." When in 1941 the Associated Press bought the Wide World from its owner the New York *Times* (the sale was effective August 1), Rosenthal became an Associated Press cameraman. By this time the photographer had won recognition at least twice: In 1934 he made newspaper headlines all over the country when, despite injuries which sent him to the hospital for eight days and the smashing of his camera, he managed to obtain a photograph of the San Francisco water front strikers. In 1936, in its first annual national competition for the best photograph of the year, *Editor and Publisher* gave Rosenthal's picture of Max Baer taking a shower first honors in the sports division and designated it the best news photograph of 1936.

After the attack on Pearl Harbor, Rosenthal did his best to get into the armed forces, but one after another the Army, Navy, and Marine Corps rejected him because of his vision, which has been described as about one-twentieth of normal. (He wears thick bifocal lenses, but even with these he has to squint at times.) Finally, however, through the agency of a friend, the eye test was waived for the photographer and he became a warrant officer in the United States Maritime Service. Assigned to a convoy bound for England in July 1943, he took pictures of the ships and of life on shipboard in the Atlantic, of British ports when he arrived in England, and of the North African theater before returning to the United States in January 1944. He went back to the A.P. when that organization offered him what he considered a better chance to see more action. From March of that year, when he was made an accredited war photographer in the Pacific area and sent out on an assignment with the Wartime Still Pictures Pool, Rosenthal was at Guadalcanal and covered invasions of New Guinea, Hollandia, Guam, Palau, Peleliu, and Angaur islands. Landings on the last three named were made, he says, within a period of only three days. In addition, he recorded action on carrier bombing missions against Formosa, Ryukyu Islands, including Okinawa, at Manila, and during the second battle of the Philippines. Before he won fame with the flag-raising photograph, he had taken another highly praised shot of the marines of the Fourth Division, "digging in on Iwo Jima, after wrecking an 'impregnable' Jap pillbox," and he has referred to himself as the man who spent a month at General MacArthur's '41 headquarters without taking a picture of the General.

The now famous picture was taken on February 23, 1945, at the second unofficial flag raising on Iwo Jima, about three-quarters of an hour after the marines had hoisted, also unofficially, a smaller banner on a staff of lead pipe. The official ceremony occurred on March 14, when Admiral Chester W. Nimitz '42 formally took military possession of the island and unfurled the Stars and Stripes at the base of Mount Suribachi. Rosenthal was not present at the first flag raising. He got the opportunity to take the photograph of the second more or less by chance when a companion pointed to the marines starting up the hill with the flag (a six-foot banner on a twenty-foot staff). Together with two Marine Corps photographers, one of whom was Sergeant William Genaust who took the movie sequence of the flag raising which was incorporated in the official film *To the Shores of Iwo Jima,* Joe Rosenthal toiled up the sandy volcanic slope, side-stepping hastily marked mines, dodging snipers' bullets, and avoiding American demolition squads. Arrived at the summit, he piled rocks and a Japanese sandbag on the crater's rim in order to gain a wider range for his camera. He took three shots, the famous one with the staff halfway up, a second with the marines surveying their accomplishment, and a third, frankly posed, with the men standing around the flag cheering.

Because he sent the film straight to Guam for developing, Rosenthal did not know until he arrived on Guam five days later which picture was meant in the radio message "Fine pix flag raising." He thought the words referred to the one for which he had posed the marines. About the picture Rosenthal said, "It wouldn't have been any disgrace at all to figure out a composition like that. But it just so happened I didn't. Good luck was with me, that's all—the wind rippling the flag right, the men in fine positions, and the day clear enough to bring everything into sharp focus." "The shot was taken," said the *New Yorker* after an interview with Rosenthal, "with a Speed Graphic, between f/8 and f/11 at 1/400th of a second, on an Agfa Ansco Superpan Press filmpack against an overcast sky, with camera visibility about five miles."

The appearance of the scene on the front page of newspapers and coloroto magazine sections won Rosenthal nation-wide acclaim and, after his return to the United States on March 17, a round of banquets and interviews planned by the Associated Press. Besides being interviewed by reporters and appearing on the radio program *We, the People*, he was asked to select a group of his Pacific photographs for publication in *U. S. Camera* and was dined by A.P. President Kent Cooper '44. He told a *New Yorker* interviewer that he would like to see the Statue of Liberty but did not expect to get the chance before being rushed to Washington. When his photograph, in the form of an oil painting by C. C. Beall (who says that the painting is an exact reproduction in color), became the official poster of the Seventh War Loan, Rosenthal was sent on a War Bond tour together with Rene Gagnon and Ira Hayes, two of the survivors of the episode. Another oil painting reproduction of the photograph, executed by Major J. Capolino, M.C.R., was presented in September to the Senate Naval Committee by General A. A. Vandegrift, Marine Corps commandant, who said Rosenthal's photograph is "the highlight of Marine Corps history in this war."

The photograph has won Rosenthal many honors, including the Pulitzer Prize of five hundred dollars for news photography in May 1945. He received one plaque from the New York Photographers Association. In April he received another from the recently organized Catholic Institute of the Press at its first public function, a Communion breakfast at the Waldorf-Astoria Hotel. (He has been a Roman Catholic since 1939.) This plaque bears on a scroll below a reproduction of the flag-raising photograph the inscription: "Faith in God was his armor, his weapons valor and skill. He served in the best traditions of the American press photographer." (Rosenthal presented the plaque to the A.P.) The A.P. itself gave Rosenthal the largest bonus it had ever given a photographer—shortly before this he had received a raise. At a dinner given in his honor by *U.S. Camera* in June, he received a thousand-dollar War Bond and a medallion. In announcing the award, *U.S. Camera* wrote: "The Editors of *U.S. Camera* were guided in making their selection by the conviction that the Iwo picture fully accomplished the ultimate purpose of photography, which is to make the viewer relive the events recorded. The Iwo picture caught the event so effectively that one who looks at it can virtually feel and hear the breeze which whips the flag. In a sense, in that moment, Rosenthal's camera recorded the soul of a nation." He also received the Graflex Camera award.

It has been estimated that for the Seventh War Loan Drive Rosenthal's flag picture appeared on 3,500,000 posters, 15,000 outdoor panels, and 175,000 car cards, not counting its appearance in simplified form in countless newspaper advertisements. It has been proposed as a model for war memorials by committees all over the country. A fifty-foot reproduction of the photograph, with lifelike twelve-foot figures posed by six marine veterans of the South Pacific, was set up by the war activities committee of the motion picture industry in the Times Square area in New York. At its unveiling, the three survivors of the flag raising hoisted the original battle-scarred banner to the top of the statue's flagstaff. The statue stood in Times Square through the summer months, and on October 26 it was presented to the United States Naval Hospital, St. Albans, Queens, New York, at a ceremony attended by more than three hundred patients and members of the hospital staff. In accepting the statue from the organization which erected it, Captain Edward D. McMorries, medical officer in command of the hospital, said, "I hope that every patient who enters the hospital may see this statue and get from it the inspiration to continue his fight back to normal health." Another statue, also modeled after the famous photograph, stands in front of the Navy Building in Washington, D.C. It was unveiled on November 10 in observance of the Marine Corps' one hundred and seventieth anniversary. In addition, the picture was used as the central design

ROSENTHAL, JOE—*Continued*

of a commemorative postage stamp honoring the achievements of the Marine Corps. The three-cent postage stamp broke all post office records for first-day cover cancellations, according to a report of the Post Office Department. A total of 400,279 covers or envelopes were canceled. (The previous record was reported to have been set by the Roosevelt Memorial three-cent stamp June 27, when 391,650 covers were canceled.)

Interviewers have found Rosenthal amiable, but shy and inclined to belittle his accomplishment, but those who know his work think his success was due as much to a keen sense for photographic possibilities as to luck. Secretary of the Navy James V. Forrestal '42 considered his action in obtaining the photograph as gallant as that of the men raising the flag. Asked about his work in the Pacific area, Rosenthal replied, "I like to go ashore during the early hours of the morning because you get better action shots. Scared? Sure, I'm scared. But there's one thing about an invasion—it's all one-way traffic and you can't get a ride going the other way." In a dispatch from Guam, Malcolm Johnson wrote: "Joe is the kind of fellow who will return from a hard day's work to find his room overflowing with acquaintances, or even strangers, engaged in an endless session of shooting the breeze. More often than not they have appropriated Joe's liquor as well as his room. Instead of remonstrating that he's tired and wants to go to bed, Joe will retire modestly to a corner, usually sitting on the floor, grin good-naturedly and then nod and doze while the session continued far into the night."

Rosenthal is short, about five feet five inches. He has a mustache and smokes cigarettes through a holder. *Time* Magazine reports that after the publication of his photograph his San Francisco draft board changed his draft status from 4-F (because of defective vision) to 2-AF (essential deferment), explaining that he now deserved "a classification better than 4-F." After spending a four-week vacation in California, he was assigned to the A.P.'s San Francisco office.

ROSS, CHARLES (GRIFFITH) Nov. 9, 1885- Journalist

Address: White House, Washington, D.C.

In what was then hailed as a master stroke in cementing relations between the White House and news disseminating agencies, President Harry S. Truman '45 in April 1945 appointed Charles Ross, leading Washington newspaperman and his lifelong friend, to the post of Presidential press secretary. Ross, in relinquishing his connection with the St. Louis *Post-Dispatch*, for which he specialized in political and economic reporting from Washington, made one proviso: that he be allowed to cover the San Francisco conference for his paper before assuming his new duties; hence, the appointment, although made on April 19, did not take effect until May 15.

Charles Griffith Ross was born in Independence, Missouri, President Truman's home town, on November 9, 1885; he is the son of James Bruce and Ella (Thomas) Ross. He and Truman received their secondary education at the same high school, which Bess Wallace, now Mrs. Truman, also attended, she being in the class below. Although Ross is nearly two years younger than the President, he was graduated with Truman in the class of 1901 and, more scholarly than his friend, he was the class's valedictorian. A contemporary, recently quoted by Cabell Phillips in a feature article for the New York *Times*, recalls that Truman and Ross were the two brightest boys in the class, and that "they spent their afternoons for a month whittling out a model bridge made exactly to the specifications of one of Caesar's bridges described in the Commentaries." After commencement their paths diverged, Truman going into business and politics and Ross to the University of Missouri at Columbia. He was graduated in 1905, a member of Phi Beta Kappa. While still at the university, Ross in 1904 joined the staff of the Columbia (Missouri) *Herald*, which position he held until 1906, when he moved to the Victor (Colorado) *Record*. During the year 1906-7 he was with the St. Louis *Post-Dispatch*, and in the following year, with the St. Louis *Republic*.

In 1908 Ross joined the faculty of the newly organized School of Journalism at the University of Missouri, the first school of its kind in the United States. Here he was with an old associate, for the dean was the late Walter Williams, editor of the Columbia *Herald*. While with the university, Ross in 1911 wrote *The Writing of the News*. On August 20, 1913, he was married to Florence Griffin. Their two sons were both in active service during the war—John Bruce was a lieutenant in the Medical Corps, Walter William a lieutenant in the Navy. In 1916-17, on a year's sabbatical leave from the University of Missouri, Ross was in Australia as sub-editor of the Melbourne *Herald*.

In 1918, ten years after his appointment to the university faculty, Ross began his long career with the St. Louis *Post-Dispatch*, on which, back in 1906-7, he had already served a year's apprenticeship. He became chief correspondent of the *Post-Dispatch*'s newly formed Washington bureau, with which he remained for a record sixteen years. In 1932 Ross won the Pulitzer Prize in journalism for an article written for his paper in 1931, "The Country's Plight—What Can Be Done About It?" an inquiry into the causes of the depression and the remedies administered by President Herbert Hoover '43. In 1933 he received a medal of honor from the University of Missouri "for his thorough intellectual background, practically motivated; for reporting significant current history; for his scholarly interpretation, lucidly and interestingly expressed, of the great efforts of the day; for his unfailing efforts to promote among the people a better understanding of government and finance, and of the whole economic fabric of the present crisis. As an extraordinary reporter of facts and ideas, he has faithfully fulfilled his public trust."

Ross left Washington for St. Louis in 1934 to become editor of the *Post-Dispatch*'s editorial page. In 1935 he was awarded an honorary Doctor of Laws degree from George Washington University (Washington, D.C.) for his contribution to journalism, and in 1936 he received the same degree from the University of Missouri. He returned to the Capital in 1939 in the capacity of contributing editor of his newspaper. During his last two years in this post he concentrated on a series of articles entitled *Men and Jobs After the War*, a study in peace and postwar problems.

According to a report in *Newsweek*, Truman had proposed the secretariat to Ross as early as April 13 (1945), the day after he became President, although the New York *Times* implies that the date was somewhat later. Ross is known to have been reluctant to exchange his eminently satisfactory contributing editorship for the governmental post; nevertheless, the President prevailed upon him to accept and upon his publisher, Joseph Pulitzer (a son of the late Joseph Pulitzer of Pulitzer Prize fame), to grant him a two-year leave of absence. The appointment was made on April 19, and was supposed to be kept secret until Ross took office. The news, however, leaked out when Truman and Ross telephoned their former high school English teacher in Independence to tell her the good news that "Harry and Charlie were working together once more." Miss Matilda Brown, or Miss Tillie as she is known to all Independence, quickly spread the news throughout the town, as Stephen T. Early '41, who was present when the call was made, predicted she would, and the Independence *Examiner* was able to offer a scoop to the country's newspapers, including the St. Louis *Post-Dispatch*. The next day, while Ross was speeding to San Francisco aboard the "Correspondents' Special," President Truman confirmed the appointment at a hastily summoned press conference. On May 15, after his return from San Francisco, Ross was sworn in as Secretary to the President, in charge of press relations, by Associate Justice Wiley Rutledge, Jr. '43, of the United States Supreme Court. The ceremony took place in Truman's office in the White House, with the President and Mrs. Ross looking on.

The position to which Ross had been appointed might be, as it was for Early during President Roosevelt's '42 last years, a difficult one, because the press secretary has to carry out the Executive's wishes without incurring the displeasure of the press; he is the "buffer" between the President and the reporters. But Ross's job was made immeasurably easier by the high esteem in which he was held by the Nation's newsmen. The news policy formulated for the new administration included one Presidential news conference a week, which Ross hoped to be able to announce well in advance. Aside from that, Ross intended to see that news emanating from White House sources would come from his office so that everyone would get a "square deal." Since President Truman approved the "fullest possible flow of information to the press and radio," Ross planned to answer all the questions he could, to admit his ignorance if he did not know the answers, and to say when information could not be disclosed. With his industry, "cool judgment," and knowledge of Washington, he was expected to be an invaluable Presidential aide. According to a feature article in the *United States News* in October, the early months of the Truman administration provide evidence that these expectations were justified. "Far more important in the shaping of general policies than he is generally given credit for," said the magazine, "is Charles G. Ross . . . [He] works quietly in the background, but his activities are considerably broader than the simple disclosure of White House news. . . .His advice [as one of the President's inner advisory circle] has carried great weight."

CHARLES ROSS

Ross is a tall gray-haired, stoop-shouldered, scholarly-looking man. Commentators agree that he brings to his new post the personal qualities of intelligence, courage, integrity, and a sense of responsibility, and that his years in Washington have given him a profound understanding of national political and economic problems. His colleagues expect Ross to succeed not merely to Early's post as press secretary but also to take Early's place as Presidential adviser, especially since Ross has more than once advised Truman in the past. Ross is not only respected but well liked by his associates for his "winning personality" and good fellowship. He is a member of the Gridiron Club, of which he was president in 1933, of the Overseas Writers, of which he was chairman in 1927, and of the fraternities Sigma Chi and Sigma Delta Chi, the latter having made him honorary national president in 1935. Described as "a man of great personal dignity but no solemnity," he enjoys the lively talk which characterizes the luncheons at the National Press Club, at which, metaphorically speaking, "no holds are barred."

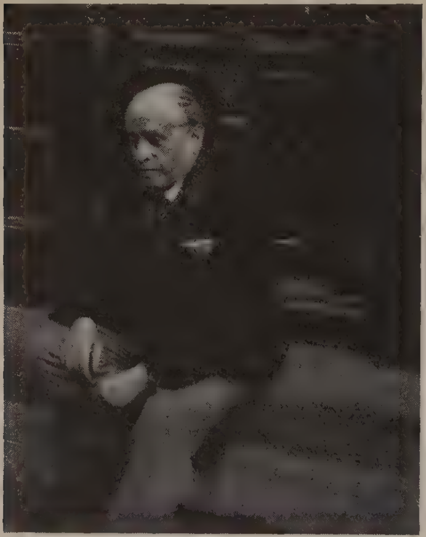
ROUAULT, GEORGES (rōō″ō′ zhôrzh) May 27, 1871- French painter, etcher, writer
Address: 14 rue de la Rochefoucauld, Paris

A "medieval modern," Georges Rouault, "laid bare the raw wounds of the human soul" in a large retrospective exhibition at New York's Museum of Modern Art from April 3 to June 3, 1945. Called the most brilliant exhibition ever held at the museum, this panorama of "mundane turbulence" which is the art of Rouault, ranged the full gamut of his work, from 1893 to 1939. "Concerned passionately and consistently with human drama . . .Rouault is neither a genre painter nor a chronicler of contemporary manners. He revolts with iconoclastic rage against the evil that he sees everywhere." Thus his work is a diatribe against, rather than a record of, society. Margaret Breuning in *Art Digest* described the exhibition as a torrential outpouring of an intense nature, and singled out three canvases for comment—the early *Clown* (1907) "with its magic of loosely washed color and broken lines of calligraphy"; the monumental *Old King* (1916-36) with its "varied impastos of color"; and the "terrible satire" of *Three Judges* (1913) "which possesses a certain cosmic grandeur in its completeness of expression."



Pierre Matisse
GEORGES ROUAULT

The tragic destiny of Rouault was foreshadowed at his birth, which occurred in Paris on May 27, 1871, during the Commune, while the city was being bombarded by the Versaillais. When a stray shell struck the family home in the Belleville quarter, the young mother was taken to the cellar and it was there that the future painter was born. His father, of Breton and Celtic origin, was a cabinetmaker and varnisher for the Pleyel piano company. His Parisian mother was the daughter of Alexandre Champdavoine, whose penchant for collecting reproductions of the artists he admired—Rembrandt, Courbet, Manet, Daumier—probably influenced his grandson. The child used to draw with chalk on the tiled floors of his grandfather's apartment in the rue de Sévigné, or to play with the paints belonging to his aunts, who decorated china and fans. Young Georges was sent to a Protestant school, because of the anticlerical views of his father. But at the age of fourteen he was apprenticed to a stained-glass maker named Hirsch, with whom he worked for the next half-dozen years.

Although Rouault regarded this period of his life as one of drudgery, he was unconsciously acquiring, as he sorted the medieval blood-red and noctural blues of the bits of twelfth- and thirteenth-century windows to be repaired, the smoldering color that was to be a distinctive feature of his art. Persisting in his desire to become a painter, young Georges, after his twelve hours' daily work in the Hirsch studio, would walk to the Ecole des Arts Décoratifs, on the other side of Paris, to draw from casts and from life, in the evenings. His Sundays were spent at the Louvre, or at home sketching himself from a mirror. After some years of this arduous existence, his ability was recognized and in 1891 he enrolled in the Ecole des Beaux-Arts, where he studied with Elie Delaunay. On the death of Delaunay soon after, Rouault became the pupil of Gustave Moreau, whose "mysticism and glowing palette" were to influence him for the rest of his life. Among other students in Moreau's classes at this time were Henri Matisse ['43] and Raoul Dufy.

Rouault soon became the favorite pupil of Moreau, who understood the melancholy youth and recognized that he should be permitted to follow his own vision. In 1892 Rouault won a student prize for a series of religious paintings, and the following year he was encouraged by his teacher to compete for the Prix de Rome with *The Ordeal of Samson*, a composition whose subject matter presaged the theme of all Rouault's later work—"man's inhumanity to man." He failed to win the prize, but in 1894 the Prix Chenavard was awarded to him for *Infant Jesus Among the Doctors*. A second entry for the Prix de Rome, which also failed to achieve that honor, *Christ Mourned by the Holy Women*, was later awarded the Prix Fortin d'Ivry in 1895 and also received honorable mention at the Exposition Universelle the same year. Advised by his teacher to leave the Beaux-Arts, Rouault forsook academic subjects and began to paint dramatic landscapes in the blue tonality then in vogue. These somber canvases, which were not representations of nature but "fabulous, legendary *décors* of imaginary locations," were exhibited in the Salon des Beaux-Arts where by virtue of the influence of Moreau Rouault showed from 1895 to 1901.

In 1898 Rouault entered upon a critical period of his life. Moreau died; and at about the same time Rouault's brother-in-law also passed away. His parents went to Algeria to stay with their bereaved daughter, and Rouault was left alone. Deprived of the advice and support of his master, and separated from his devoted family, he experienced a period of solitary sorrow that led to a moral crisis. It is to the sufferings endured at this time that Rouault attributes the bitter quality that has permeated all his subsequent work. Moreau had willed his home and his paintings to the City of Paris. When the Musée Gustave Moreau was established, Rouault was made the curator, a position he still holds. But this honor did not dispel the gloom that shadowed the artist. He has never ceased to mourn his friend and teacher. Rouault had been influenced by the Catholic writer, Ernest Hello; and also by the novels of Léon Bloy, who later became a friend of the painter, though never an admirer of his art. Another friend was Joris-Karl Huysmans, who tried to form a group of Catholic artists at the Trappist monastery at Ligugé in Poitou, where Rouault sometimes went on short visits. Here he had a resurgence of faith and thought of taking monastic vows, but was restrained by the advice Moreau had given him against retirement from the world. Always energetic, Rouault worked with such intensity that he became ill, and was obliged to go to Switzerland to recuperate. The beauty of the country and, above all, the quality of light acted as a tonic, and when he returned to Paris he discarded the browns and heavy blues of his former tonality and began to paint in a lighter key, remarking that the rest, the sky, and the snow had cleansed his eye.

Rouault had now broken completely with the conventional style of religious art and had begun to paint what André Malraux calls his "trinity of parodies, the harlot, the buffoon, and the judge," introducing to the public a "world of tragedy." In 1902 he became one of a coterie of artists who founded the Salon d'Automne the following year, to provide artists not welcome at the national Salon an opportunity to exhibit. The 1905 Salon d'Automne, held in the Grand Palais, had a room set aside for a group of youthful painters, including Rouault, Matisse, Derain, Dufy, and Braque. Their canvases shocked visitors to the exhibition, who called the artists the Fauves, the "wild beasts" of Paris. Rouault himself, on seeing for the first time one of his new canvases hung in an exhibition, had exclaimed, "What a terrible thing I have done!" Later these painters became known as the School of Paris. Rouault also exhibited in the Salon des Indépendants, from 1905 to 1912, and in addition appeared at the Berthe Weill gallery from time to time. But he was never closely identified with any group, "he has followed his own path, keeping quietly clear both of limelight and controversy." Wilenski, writing in *Apollo*, called him "one of the few individual artists in Europe," and commented that "in a way that defies analysis this artist pours a passionate temperament into his plastic creations." Outstanding among the water colors of this period are the defiant *Circus Woman* (1906) in pastel and gouache, whose caricatural grandeur recalls Goya and Daumier; *Woman at a Table* (1906); and *Red Haired Woman* (1908). The rose, blue, and orange tones derive from Cézanne. Sometime during 1906 Druet became the first dealer to handle Rouault's work; the E. Druet Galleries organized the first big Rouault exhibition, comprising one hundred and eighty-three items—paintings, drawings, and ceramics—in 1910. Druet was succeeded by Ambroise Vollard, who became Rouault's dealer in 1916.

There now began Rouault's intense preoccupation with illustration, which has earned him the title of "master of black." Before the war he had experimented with monotypes, and had published a color lithograph, *Les Chevaux.* His work for Vollard at first consisted of etchings and wood engravings for the dealer's *Réincarnations du Père Ubu* (1932), a sequel to Alfred Jarry's *Ubu Roi.* It is in this series of plates that Rouault is considered to have realized most fully his talents. Other series of etchings and lithographs were made for *Les Clowns* (1922), with text by Henry Church; *Paysages légendaires* (1924), with poems by Rouault; *Le Cirque de l'étoile filante* (1930), with text by Rouault; *Passion* (1939), with text by André Suarès; and *Divertissement,* with poems by Rouault, brought out by *Verve* in 1943. According to Venturi, there is a pictorial freedom in Rouault's lithographs that is absent in his paintings. In the medium of print-making he is influenced by Goya as well as by Rembrandt. A powerful colorist, he attains dramatic effects of velvety texture, depth, and chiaroscuro when working with his favorite color—black. Carl O. Schniewind observes that Rouault has "brought new life into the time-worn methods of traditional etching." Employing the "same copious ingenuity and disrespect for all conventions," he "uses almost every instrument known to the engraver, and every acid known to the etcher in order to render to his satisfaction the tones and values of his unique images." In his color etchings Rouault has had expert assistants. He has also made no attempt to master the technique of wood engraving. For his series of woodcuts he has had the collaboration of Georges Aubert, considered "the most skillful technician of our time." Together they have supplemented the etchings and lithographs in his books with several hundred wood blocks whose variations of blacks are so liquid and so luminous that they "achieve the effect of black and white reproductions of oil paintings."

During Rouault's protracted activities for the Vollard publications, he did not entirely neglect his oils. Progress on the enormous number of sketches he had made prior to 1916—after which date no new themes appeared—still continued. The series of types he had created for his "human comedy" served as a basis for his subsequent output. As he worked over these

ROUAULT, GEORGES—*Continued*

sketches in an endless search for perfection, his canvases became overlaid with thick coatings of pigment which deepened in luminosity. An example of this method is *The Old King,* in which the magic richness of color is superimposed "like a sensual veil." Frank Crowninshield considers that the "indescribable note of grandeur and energy" in Rouault's painting is the result of "spreading pure colors . . . over fairly sizable areas . . . of avoiding muted, or dirty, effects by refusing to mix his paints . . . and of giving his color blocks ['emerald greens, mineral blues, van Gogh yellows, blood reds'] an added importance by the blackest, broadest, and most dramatic of outlines." As for distortion, Wilenski contends that Rouault does not distort nature because the figures in his pictures only exist within the concept in the artist's mind. Critics agree that it is "farfetched to attempt to assign any progenitors to Rouault. That he has no followers is, according to Jan Gordon, "the natural result of an artist who insists upon personality; he becomes inimitable."

A decade of exhibitions included a one-man show at the Gallerie La Licorne in Paris in 1921; an important retrospective at the Gallerie E. Druet in 1924, when his first museum sale was made (to the Musée de Grenoble, for the early *Christ Mourned by the Holy Women*); and at various galleries in Berlin, Munich, Zurich, and London. In 1930 Rouault's first one-man show in New York was held at the Brummer Gallery. Royal Cortissoz found "not a trace of beauty in the exhibition," but noted the brute force, energy, and expressiveness in the artist's work. *Art Digest* considered that the group of religious subjects revealed the heart of Rouault's genius, while the critic of *Art News* found Rouault a strangely aloof personality curiously self-sufficient and single-minded, and noted that the bitterness and scorn that emanated from most of his work was softened in the deeply felt tragedy of *L'Enterrement* and in the portrait of the charming young girl in *Qui est vrai et simple.* After the Brummer exhibition, Rouault's work appeared at various other galleries in New York, including the Julien Levy Gallery in 1933, where the superstylized plates for his illustrations for *Les Réincarnations du Père Ubu* were considered "exciting documents for those who have come to enjoy Rouault's strange and often violent art"; and in November of that same year the Pierre Matisse Gallery exhibition of twenty paintings, "macabre, melancholy, often grotesque," which embodied his "protest against the existing social order."

It has been asked why the work of so Christian a painter as Georges Rouault should not find favor with the Roman Catholic Church. This is explained by Waldemar-George, who states in *La Renaissance* (1937) that the church, accustomed to a more conventional art, objects to the "violence, the brutal and figurative language, the mixture of heresy and sacred and profane elements which are characteristic of Rouault's art," and "accuses the painter of the *Christ mort* of spreading despair, distorting the legend of the Saviour, and of disseminating terror." According to Waldemar-George, the only Catholic writers who understand the meaning and significance of Rouault's religious pictures are Jacques Maritain and René Schwob. Rouault himself says, "A Christian, I believe only in these threatening times in Jesus on the Cross."

In 1938 New York's Museum of Modern Art held an exhibition of Rouault's prints, an event of especial significance in that it was the first museum-sponsored show of his work. Included were nearly one hundred and fifty lithographs, wood engravings, and etchings from his books, and from the *Miserere et guerre* series, as well as various portraits—"the first comprehensive showing of his graphic work in America." *Art Digest* noted that "the prints smolder with the same fire that burns in the paintings and the same stylistic characterizations are evident in both." This exhibition was followed by an important retrospective of Rouault's work at Boston's Institute of Modern Art. Alfred Frankfurter, in *Art News,* described it as "a broad, rich panorama of a man's art," showing the three phases of the painter's development. He cited the *Calvary* (1891), with its perfect draftsmanship and influence of Rembrandt and Rubens, as an outstanding example of his first and academic period; the *Woman With a Hat* (1908), with its pure blue and red dominants, and *Clown* as examples of the middle period, contemporary with his Fauve days; and *Three Judges, Circus Trio,* and *The Old King* (considered one of Rouault's most important paintings, with its burning reds, golds, and nocturnal blues) as examples of his late period. Later this exhibition was seen at the Phillips Memorial Gallery in Washington, the San Francisco Museum of Art, and in abbreviated form at the Marie Harriman Gallery in New York.

Although the bulk of Rouault's work is in painting and illustration, he has experimented with other forms. Early in his career he became interested in ceramics, making a number of decorations for pottery which were carried out by Albert Metthey, the master potter of Asnières-sur-Seine, who collaborated with many of the Fauve group. Metthey also assisted Rouault in various circular ceramics, the most noted being the *Head of Christ,* a liturgical work. In 1929 Rouault supplied the *décors* for Prokofiev's ballet, *Le Fils prodigue,* which was produced in Paris in May 1929, by Diaghilev. According to Michel Georges-Michel, Rouault accepted the commission for these sets because he thought it would be like painting immense stained glass windows. But he had to make a careful study of lighting—necessary in stage designing—and to work with "tumultuous" speed, something quite foreign to his nature, for he often spent five years on a single canvas. Henry Prunières, in his Paris column of the New York *Times,* called this ballet the "great event of the Russian season" and added that "the very beautiful *décors* by Georges Rouault, which can only be criticized as being a picture rather than a *décor,* contributed to the success of the production." Another medium in which Rouault succeeded was tapestry. He painted a number of "cartoons" which were executed in low-warp Point de Beauvais under the supervision of Mme. Marie Cuttoli, who, in an attempt to revive the art of tapestry weaving, had persuaded seven famous modern painters—Dufy, Braque, Rouault, Picasso, Léger, Lurçat, and Matisse—to make some designs for her. The most striking of the Rouault tapestries are *The Dancer, Wounded Clown,* and *St. Veronica's Veil.* Mme. Cuttoli's collection of modern French tapestries was exhibited at the Bignou Gallery in New York in April 1936.

In contrast to the "hell Rouault has created and filled with grim, gloomy figures, saints and whores, sinister clowns of the circus and grotesque politicians and magistrates," his writings are "full of allusions to music, theology and classic poetry—one finds in them scarcely a reference to modern history, or class injustice or the ghastly alternatives of European war and peace." His first poems appeared in *Les Soirées de Paris* in 1914. Later he wrote frequent articles and poems for *Verve, La Revue universelle,* the *Journal des Beaux-Arts, Mercure de France, L'Amour de l'art,* and other publications. His first book, *Souvenirs intimes,* which appeared in 1926, is concerned with various figures of the art world—Moreau, Degas, Cézanne, and others, and contains a number of portraits by the author. In addition, Rouault wrote text and poems to accompany his books of etchings—*Paysages légendaires, Le Cirque de l'étoile filante, Divertissement.* These volumes, all of generous size, are intended to be read on lecterns.

Examples of Rouault's work are in the museums of Avallon, Colmar, Copenhagen, Frankfurt, Grenoble, Moscow, London, Paris, New York, Pittsburgh; and in many private collections in the United States and Europe. In 1924 the artist was decorated with the Legion of Honor, in recognition of his services as curator of the Musée Gustave Moreau.

Rouault, who has been described by Raïssa Maritain as having a long face with ivory paleness, thin lips, clear blue eyes, and a melancholy air, is married to the former Marthe Le Sidaner, of the painter family. They have four children—Géneviève, Isabelle, Michel, and Agnès. Georges Rouault has been a victim of three wars—the last days of the Paris Commune, which cast a shadow over his birth, the First World War; and the Second World War. The First World War unsettled the artist's financial condition, his income from the museum shrank, Mme. Rouault was obliged to give piano lessons to help defray the expenses of the children's schooling, and Rouault sold many of his canvases for small sums. When the Germans began to shell Paris in 1918 Vollard became alarmed for the safety of his collection and begged Rouault, who had gone to L'Isle-sur-le-Serein with his family, to care for his treasures. A house at Saumur, on the Loire, was found and Rouault became the custodian, until the end of the war, of seventy packages of the works of Cézanne, Degas, Gauguin, and Renoir. In 1940 Rouault was at his country home, in Beaumont-sur-Sarthe, when the first fugitives from the Nazis appeared. Persuaded by his daughter Géneviève to join the stream of refugees, Rouault, his wife, his two daughters, and his grandchildren drove across the Massif Central to Grasse. Later, at Golfe Juan, on the Riviera, the artist and his family lived in a small apartment; he wrote at night and painted during the day. But he was not happy in this environment, and after a time returned to Beaumont, in occupied territory, where he was unmolested by the Germans, although his anti-Nazi sentiments were well known. He made "pitiless caricatures of the German General Staff, called 'vons'" and his expressions of hatred for the Nazis were "like the imprecations of the prophets." Now back in Paris, the painter, who is regarded as "the great tragic artist of our time," is reported to be "working with freshness and freedom and may yet give new proof to the world of his innate gifts."

ROWE, L(EO) S(TANTON) (rō) Sept. 17, 1871- Director-general of the Pan American Union

Address: b. Pan American Union, Washington, D.C.

For more than two decades L. S. Rowe has been director-general of the Pan American Union. His work in the interest of Pan Americanism has been reflected in the Union's record of constantly expanding influence and activities, in which every opportunity to foster cooperation among the governments and peoples of the American republics has been utilized. For these services as a Good Neighbor, Rowe himself has received recognition from many of the countries of Latin America.

Leo Stanton Rowe, the son of Louis and Katherine (Raff) Rowe, was born in McGregor, Iowa, on September 17, 1871. He received his early education in Pennsylvania, and in 1887 was graduated from Central High School in Philadelphia with that school's degree. Three years later he received the degree of Bachelor of Science from the University of Pennsylvania. The nineteen-year-old Rowe then went abroad, and after several years in France, Austria, and Germany, he received his Ph.D. from the University of Halle, in Germany. He returned to the United States to continue his studies at the University of Pennsylvania, and in 1895 received his LL.B.

Although he was admitted to the Pennsylvania bar after receiving his law degree, Rowe turned to teaching. He became an instructor in municipal government at the university, and the following year was advanced to assistant professor of political science; in 1904 he was made head professor. During the years immediately preceding the outbreak of the First

L. S. ROWE

World War, he occupied the chair of international law at the Wharton School of the University of Pennsylvania.

While at the University of Pennsylvania, Rowe several times served on Government committees or was the United States delegate on international commissions. His first assignment took him to Puerto Rico in 1900-1 as a member of the commission appointed by President McKinley to revise and compile the laws of the island. The report of the commission, which appeared in 1901, was compiled by Rowe, Judge Daly, and Juan Hernandez-Lopez. The next year, in 1901-2, the professor was chairman of the Insular Code Commission. His report, drawn up with J. M. Keedy, was published in eight volumes in 1902. The findings of these two commissions were adopted substantially as the law under which the island is now governed. Rowe's own book, *The United States and Puerto Rico, with Special Reference to the Problems Arising out of Our Contact with the Spanish-American Civilization*, was published in 1904.

Rowe resumed his work in the international field in 1906, when he went to Rio de Janeiro as the United States delegate to the Third International Conference of American States. Since that time he has attended most of the important inter-American scientific, economic, and political meetings, activity which has given him a knowledge of the two continents considered second to none in the diplomatic service. (In 1945 he represented the Pan American Union at the United Nations Conference on International Organization, in San Francisco.) He was chairman of the delegation to the First Pan American Scientific Congress at Santiago, Chile, December 25, 1908 to January 5, 1909; and when the second congress was held in 1915 he was again the delegate from his country. In 1913 he was a member of the United States-Panama Mixed Claims Commission in Washington, D.C.; in 1915 he served as secretary-general of the First Pan American Financial Conference in Washington; and later (1915-17) he was secretary general of the United States section of the Inter-American High Commission. At this time he also prepared a study on municipal government, *Problems of City Government* (1908), and a book in Spanish entitled *Problemas Americanos Conferencias*, which appeared in 1915.

In 1917 Rowe was appointed Assistant Secretary of the United States Treasury, and in order to accept the post he resigned from the university faculty. He served two years in the office and a year as chief of the Latin American Section of the Department of State, an appointment which *Pan American* Magazine characterized as a tribute to his judgment and statesmanship. His studies of the effects of the war on Latin American countries appeared as *Early Effects of the European War Upon the Finance, Commerce, and Industry of Chile* (1918) and *Early Effects of the European War Upon the Finance, Commerce, and Industry of Peru* (1920).

Rowe's work in the field of inter-American affairs led to his election in 1920 as director-general of the Pan American Union, the oldest organized expression of the Good Neighbor Policy. The Union was formed in 1890 as a result of the first Pan American Congress, which was held in 1889-90 on the invitation of the United States. (It was originally called the International Bureau of American Republics; in 1910 its present name was adopted.) The governing board is made up of the United States Secretary of State and the diplomatic representatives in Washington of the other American states. The management is in the hands of the director-general (with headquarters in Washington). As the official international organization of the twenty-one republics, the Union is maintained to disseminate information, promote understanding, and advance peace and arbitration among the nations. To this end, it periodically issues bulletins giving commercial, economic, political, and cultural information on the republics. "The Pan American Union," the Director-General has said, "is the outward symbol of an American continental system, rooted in the idea of international cooperation, good will and mutual helpfulness, dedicated to the ideals of peace, and laboring day in and day out to strengthen the bonds of friendship and understanding between the nations of the Western world."

Rowe contends that "whether we like it or not, we have been thrust into a world situation that has placed a great responsibility on our country. Never again will it be possible for us to withdraw from our obligations, as was the case at the close of the First World War. Not only shall we be called upon to play an important part in the final settlement, but we shall have to accept heavy responsibilities in making that settlement work for the benefit of all mankind as well as for ourselves." He believes that the Americas have learned the principles on which the future peace of the world depends. These he states are as follows: (1) no matter how difficult or delicate the controversy, it can be settled peacefully; (2) any menace to one is a menace to all; (3) principles of economic and financial cooperation which have proved so fruitful on the American continent must be applied in world affairs; (4) every resource must be used to secure for all peoples freedom under law and enjoyment of the fundamental civil rights; and (5) the vast resources of the Americas must be used in rehabilitation of the economic and financial structure of the devasted sections of the world.

Rowe's contributions to the cause of Pan Americanism and peace have been recognized by numerous allied organizations, and by many of the countries of Central and South America. In addition, he has received honorary Doctor of Laws degrees from the National University of La Plata in Argentina (1906), the University of San Marcos in Peru (1906), the University of Chile (1907), the University of Pennsylvania (1931), Georgetown University (1933); and in 1942 he received a Doctor of Laws from Catholic University of America. In honor of his twenty-fifth year as director-general of the Pan American Union, a dinner was given in Rowe's honor. Tributes were paid him by Senator Tom Connally, Frederick E. Hasler, president of the Pan American Society, and Dr. George William McClelland, president of the University of Pennsylvania. President Truman sent a message of congratulation in which he said: "Dr. Rowe's contribution to the cause of Inter-American friendship and understanding is deserving of the highest honors. His belief in the ideals of Pan Americanism, his qualities of statesmanship and leadership and his ability to overcome obstacles to unity and cooperation among the twenty-one American republics have been of major importance."

The Director-General of the Pan American Union is a slight man, several inches under six feet in height and weighing one hundred and thirty pounds. He has blue eyes and brown hair. His interests are broad, his activities include membership, some honorary, in numerous cultural, historical, scientific, and legal societies in both the Americas. For twenty-eight years he was president of the American Academy of Political and Social Science. From 1921 to 1926 he was in charge of the Latin American Round Table at the Institute of Politics in Williamstown, Massachusetts. And, in addition to his activities at rostrum and round table, he has contributed articles, monographs, and reports to numerous economic, political, and scientific journals, including the *Annals of the American Academy of Political and Social Science,* and he is the author of a number of books and pamphlets dealing with Latin-American affairs.

When the 1940 gold medal of the Inter-American Commercial Arbitration Commission was presented to this veteran worker in the cause of hemisphere solidarity, Spruille Braden, then the United States Ambassador to Colombia and honorary chairman of the commission, said: "Quietly and unremittingly you have labored for more than twenty years to advance the principle that all differences, large or small, may be accommodated pacifically."

RUBINSTEIN, ARTUR (ro͞o'bĭn-stīn är'to͞or) Jan. 28, 1886- Pianist

Address: b. c/o Hurok Attractions, Inc., 30 Rockefeller Plaza, New York City; h. 12921 Marlboro St., Brentwood, West Los Angeles, Calif.

The internationally known Polish pianist, Artur Rubinstein, who has traveled over a million miles, is a favorite of American concert-goers and "the adopted son of all Spanish-speaking countries." He has toured the world as a concert artist and during the two World Wars he was looked upon as an unofficial ambassador for his freedom-loving country.

The youngest of the seven children of Ignace and Felicia (Heyman) Rubinstein, Artur Rubinstein was born in Lodz, Poland, on January 28, 1886. The child showed his musical talent at the age of three, when he was given his first lessons on the piano. Within the next three years he had given two public solo performances for charity, one at Warsaw. When Artur was eight years old he began to study in the Polish capital, but in a few months he had exhausted the teaching of his instructor. At that time, however, the prodigy's sister was leaving for Berlin to prepare for her marriage, and it was decided that the boy accompany her so that he might perform for Joseph Joachim, the violinist. Joachim was so much interested in the boy's musical gift that he assumed responsibility for the development of Artur's talent, a relationship which was to last for eight years. The protégé was sent to Heinrich Barth for piano technique, and to Robert Kahn and Max Bruch for instruction in theory, harmony, and composition. When Joachim sent his charge to Paderewski, the Polish pianist and statesman was so greatly impressed by the youth's ability that he asked young Artur to remain with him for three months.

At eleven young Artur made his formal debut in Berlin, when he performed the Mozart A Major Concerto with Joachim conducting the Berlin Symphony Orchestra. This concert is considered as marking the beginning of his career. From that time until his twentieth year, he performed in his own country, Germany, Russia, and France. In Poland Rubinstein, then fifteen, played with the Warsaw Symphony Orchestra under the baton of Emil Mlynarski, whose daughter Aniela, as yet unborn, was later to become the wife of the piano virtuoso. When in Russia, he toured with Serge Koussevitsky '40, who was then conducting his own orchestra. Rubinstein's talent received greater recognition with each concert, and he became renowned for his interpretation of Chopin,

ARTUR RUBINSTEIN

Beethoven, and Liszt. After meeting the young pianist in Paris, Saint-Saëns introduced him to the Concert Society of Paris (a fraternal organization of musicians) as one of the greatest artists he knew. "I foresee for him an admirable career. . . .He is worthy of the great name he bears." (Artur Rubinstein, however, is not related to the Russian composer and pianist Anton Rubinstein.)

Twenty-year-old Artur Rubinstein made his first American appearance in January 1906 in Philadelphia, where he played with the Philadelphia Orchestra; and he made his New York debut in Carnegie Hall a few days later with the same orchestra, Fritz Scheel conducting. Richard Aldrich, in a review (reprinted in his book *Concert Life in New York, 1902-1923*), said that the young artist displayed "a crisp and brilliant touch, remarkable facility, and fleetness of technique," but he added that "there is little worth of beauty in Rubinstein's tone and little variety in his effects. It would be interesting to know whether he can express some of the deeper things there are in music." One week after his Carnegie Hall appearance Rubinstein gave a recital of Bach, Beethoven, and Schumann at the old Casino Theatre. He was acclaimed again for his technique, although the critics were dubious about his interpretative abilities—"then, naturally, not fully developed." Rubinstein gave seventy-five concerts in the three months he spent in the United States, and he then returned to Europe, where he went into temporary retirement. He lived in Paris and devoted himself to further study, in order, he explains, to "hurdle the greatest obstacle in the path of a prodigy, that of shedding my immaturity."

In 1910 Rubinstein made his first re-appearance in Berlin, and during the next six years he concertized throughout Europe. (For his St. Petersburg's performance he chose Anton Rubinstein's Concerto in D Minor.) With his return to concert work, "he was unanimously acclaimed as a mature artist," David Ewen writes in *Living Musicians*. For his tour of Italy, which he made immediately before the First World War, Rubinstein was given a diplomatic passport by the Italian government. His native Poland had granted him a similar document with the inscription: "On a mission of art for Poland."

Rubinstein was in London at the outbreak of the First World War. Although he wanted to enlist with the Polish Legion, his knowledge of eight languages made him more valuable as an interpreter at the Allied Headquarters. He served in this capacity for a few months; he then went out on tour for the Allied cause with the violinist Eugène Ysaye, on which they played a series of nine concerts. Shocked by the Germans' treatment of Belgians and Poles, Rubinstein vowed then that he would never perform in Germany again, a vow he has kept.

Rubinstein's first visit to Spain in 1916, where he played the music of Spanish composers like Manuel de Falla and Albéniz, won him a reputation as the leading interpreter of their music. Scheduled to give four concerts, he remained to give one hundred and twenty. This success brought invitations to visit the Spanish-speaking countries of South America. That tour was so prolonged that Rubinstein did not reach the United States again until the 1919 concert season.

His return concert in North America was given in Carnegie Hall on February 20, 1919. The pianist had given two recitals in the United States thirteen years previously, but this second appearance was considered his official North American debut. The New York *Times* reviewer called him "a pianist of great charm and technical finesse," and one whose tone was "light" and whose style was "casual." The critic summed up the concert thus: "It may be said of Rubinstein that he came, played, and was liked. But a miniaturist." During the next ten years the artist gave concerts in the United States, South America, and Europe. While in the United States he appeared with the leading orchestras and such conductors as Walter Damrosch '44, Leopold Stokowski '41, Pierre Monteux, and Willem Mengelberg. The American concert stage did not see Rubinstein for almost another decade: he toured Europe, South America, and in Australia alone gave twenty-four concerts.

Appearing again in the United States in 1940, Artur Rubinstein gave a number of concerts in New York in Carnegie Hall, Town Hall, and Lewisohn Stadium. After hearing the pianist in Carnegie Hall in the late spring of 1940, Irving Kolodin of the New York *Sun* wrote: "Mr. Rubinstein plays Bach seriously, Beethoven intelligently, and Brahms earnestly," while the music critic of the New York *World-Telegram* reported that the audience was "gaping in wonder" as the virtuoso "outdid himself" at the recital. When Rubinstein gave a program of the compositions of Beethoven, Schumann, Chopin, Ravel, Rathaus, Shostakovich '41, and De Falla on November 26, 1942, Robert Laurence felt that the artist, "when at his best ranks among the greatest pianists of the day," and Henry Simon of *PM* expressed the feeling that a "Rubinstein recital becomes not only a fine musical experience, but an Event." The following year Artur Rubinstein gave his only concert of the season, when the New York critics found him not in "top form." When he gave an all-Chopin program in honor of his compatriot in 1944, the critics acclaimed him for playing the works with "surpassing sensitivity."

The Polish pianist has made numerous recordings. These include solos and concertos with the London Symphony Orchestra, and albums of the music of Chopin, Brahms, Franck, Bach, Tchaikovsky, and of Heitor Villa-Lobos '45, whose music Rubinstein made popular. His recording of the Brahms D Minor Sonata, made with the late violinist Paul Kochanski, is a collectors' item. It has been estimated that his record albums gross over $500,000 annually. In discussing the album of Villa-Lobos music, a New York *Times* critic called the interpretations "authoritative and highly effective"; Rubinstein "can usually be counted on for a vigorous, colorful reading, and this album is no exception to the rule." The pianist's recording of the Tchaikovsky Concerto in B Flat Minor, which sold over 200,000, so appealed to bandleader Freddie Martin that he made an arrangement of the compostion for dance orchestras. Supplied with a lyric and a title, "Tonight We Love" started a "national furor"—it was played in juke boxes from coast to coast and eventually became the Number One song on *Your Hit Parade,* a radio program devoted to the ten most popular songs of the day. In October Rubinstein signed a contract with Republic, one of the smaller Hollywood studios, to record the entire musical score for the Technicolor film *Concerto* for which he was to receive a reported $85,000. He will play Rachmaninoff's Second Concerto and Beethoven's Sonata Appassionata. The artist will not be seen in the motion picture, as he believes it would be "an egregious folly" to allow himself to be photographed for the screen.

In addition to being recognized as a fine interpreter of Brahms and Chopin, Rubinstein has also been acclaimed, by modern composers, for his interpretation of their own works. "The two toughest keyboard workouts of all time" were dedicated to him by their composers: Stravinsky's Sonata from the ballet score of *Petrouchka,* and Villa-Lobos' *Rudepoêma.* Rubinstein has received decorations from several countries: the Legion of Honor from France, the Cross of Alfonso XII from Spain, the Commander of the Crown and Officer, Order of Leopold I from Belgium, the Polonia Restituta, his native Poland's highest decoration; and the Commander of the Crown from Italy, which he returned in 1938.

Artur Rubinstein has been described as a loquacious, "small, dapper, pink-cheeked man," a connoisseur of wine, cigars, and fashion. The pianist ended his bachelorhood at the age of forty-six when he was married to Aniela Mlynarski in Paris. They have three children, a son and two daughters, Eva, Paul, and Alina. Although the Rubinsteins are now living in California, they have a home in Paris which they vacated shortly before the Nazi occupation of France. There the pianist had a valuable library of rare musical objects and first editions, many art treasures, and toys, which he had collected during his trips around the world. The pianist has composed several piano compositions and chamber music, and has written articles on the piano for *Etude.* As friends he prefers writers to musicians, and one of his closest friends is Ernest Hemingway. At one time he was commissioned to write his autobiography, of which, however, he said: "I cannot write it. My life is too naughty. I am too shy about telling it."

SABIN, FLORENCE R(ENA) (sā'bĭn) Nov. 9, 1871- Anatomist

Address: h. 1333 Tenth Ave., Denver, Colo.

"A time will come when men and women will live their alloted span quietly, peacefully, without illness, free from pain, until they pass gently, as a tired child closes sleepy eyes, from this world to the next." These words of Dr. Florence R. Sabin embody her credo, an aim toward which she has devoted her life, tirelessly and fruitfully. Dr. Sabin ranks among the world's most distinguished scientists, her research work on the lymphatics, the blood cells and vessels, bone marrow, and tuberculosis, having won for her the highest recognition of her profession.

DR. FLORENCE R. SABIN

Florence Rena Sabin was born in Central City, Colorado, November 9, 1871. Her father, George Kimball Sabin, had come from Vermont to go into mining and there had met and married Rena Miner, also of Vermont, who had come to teach school in the rugged West. They sent their young daughter, Florence, to be educated in Vermont where she prepared for college. She then attended Smith College, from which she was graduated with her B.S. in 1893. While at Smith, Miss Sabin became interested in zoology and, after learning that the new Johns Hopkins Medical School was open to women, she decided to become a doctor. (The founders of Johns Hopkins, which was opened in 1893, had provided for the admission of men and women on equal terms.) To earn money for her medical education, Florence Sabin taught school for three years—mathematics at Wolfe Hall in Denver, and zoology at Smith. Finally she entered the fourth class of the Johns Hopkins Medical School, one of fifteen women in a class of forty-two. As a student, she attracted the attention of her professors by her enthusiasm for laboratory work and her accuracy in detail. Her professor of anatomy, Dr. Franklin P. Mall, suggested that she make a model of the brain stem of the newborn child, which had never been done before. This she did, producing a model of such precision that new light was shed on the general structure of the lower brain area. Reproductions of this model are still in use in medical schools throughout the world.

Florence Sabin received her medical degree from Johns Hopkins in 1900 and remained as interne at the hospital for a year. The following year she was granted a year's fellowship by the Baltimore Association for the Advancement of University Education of Women. Again, at Dr. Mall's suggestion she began a special study of the lymphatics (the vessels that conduct the lymph through the body), making discoveries that overturned the accepted medical theories on the subject. For her paper on the development of the lymphatic system, Dr. Sabin received the thousand-dollar award of the Naples Table Association. After this year of research the objections to the presence of a woman in the laboratory were soon forgotten, and the scientist joined the faculty of Johns Hopkins in 1902 as assistant in anatomy. She continued her research work while teaching, enriching her lectures with reports on her own experiments. By 1905 she was an associate professor, a post she held until 1917, when she was appointed a full professor of histology.

Of Dr. Sabin's work at that time, Alice Booth wrote: "The research on lymphatics led her to restudy the old problem of how blood vessels arise and develop, and, working with the blastoderms of chicks . . . to follow the development of the veins and capillaries in the living specimens." Dr. Sabin and her collaborators then devoted years of research to the study and observation of the red and white corpuscles, a monumental scientific task, requiring skill and perseverance. In an article in a 1926 issue of *World's Work,* Frances McMullen described this research: First, they had to establish a post of observation whence they might effectively scrutinize the territory. This involved perfecting a technique whereby they might study a living blood specimen under the microscope. Next they had to count the forces that came within their range of vision, listing the number of red corpuscles and of the seven different kinds of white corpuscles in every drop of blood. As the numbers were never the same in two successive counts, they decided to stick at the census work by the day. Every fifteen minutes Dr. Sabin would take a fresh drop of blood from her finger, mount it on a slide and slip it under the microscope. From morning until night and sometimes far into the night, often going without lunch, the group took records, on different days, of the numerical strength of the corpuscle regiments. After such a day, weeks were needed to chart and interpret the data. During her years of work on the blood, Dr. Sabin perfected a technique of her own, establishing basic methods for a new system of studying the corpuscles. By 1919 she had determined the origin of the red corpuscles. Her work was then judged of great promise for the future control of diseases of the blood.

In 1925 Dr. Sabin terminated a long and mutually rewarding association with Johns Hopkins by joining the staff of the Rockefeller Institute for Medical Research in New York. Here she continued her work on the blood, concentrating on the relationship of her studies to tuberculosis. Supervising a group working on the problem of tuberculosis, Dr. Sabin studied the tubercle bacillus for several years. Firmly convinced that the fight against tuberculosis could be won, she declared: "If I didn't believe the answer could be found, I wouldn't be working on it." Four years after Dr. Sabin joined the Institute, Dr. Simon Flexner, then head of medical research, called her "the greatest living woman scientist and one of the foremost scientists of all time." In 1939, in compliance with the rules of retirement of the Rockefeller Foundation, Dr. Sabin and four other scientists turned over their administrative duties to younger colleagues but continued their important research in the laboratories. According to *Time*, these scientists were "five of the keenest scientific brains on earth."

When Dr. Sabin left Johns Hopkins she had ended a teaching career of twenty-six years. In her presidential address before the American Association of Anatomists in 1925, she discussed the general principles of teaching in relation to the teaching of anatomy. This detailed address was published as the leading article in *Science*, May 15, 1925. In it the scientist declared: "I have ceased to be a professional teacher, but remain a professional student." She expounded her views of scientific education, offering as basic principles "liberty of thought in education and cooperation in research." These principles have served Dr. Sabin well throughout her career. As a teacher, she was undogmatic, vigorous, always alive to growth and change within her field. "Books are merely records of what other people have thought and observed," she would tell her students. "The material is a far safer guide." She favored dynamic teaching methods, and encouraged complete freedom within the course for the teacher and the student. Another tenet was one Dr. Mall had impressed upon her when she taught her first class: "Never make your directions for students so specific as to rob them of the pleasure of discovering things for themselves." Two of her former pupils who were to become her associates in her work on the blood were Dr. R. S. Cunningham and Dr. Charles A. Doan. "Dr. Sabin," wrote Frances McMullen, "has always believed in the efficacy of group work for science and points out that such investigations as hers could not have been undertaken otherwise." Of research Dr. Sabin has said: "Research lifts teaching to a high plane. No one can be a really great educator unless he himself is an investigator." She also has definite views about making known the progress of research. "The investigator who holds back his conclusions until he is absolutely sure, never progresses far. When I reach certain conclusions, I do not hesitate to publish them, even though, after further study, I may find I was wrong; then I do not hesitate to say that I have changed my mind."

Articles by Dr. Sabin have been widely published in medical journals, and she has been called upon to speak on numerous occasions. In both her speech and writing, the stamp of the scientist is apparent. Logical sequence of thought and vivid clarity of diction distinguish her expression. In an address at Bryn Mawr College in 1936, entitled "Women in Science," Dr. Sabin paid tribute to the early fighters in the cause of women's rights in the educational field. She also discussed the significant contributions made by women to scientific progress. In 1934 Dr. Sabin's biography of her old professor, Dr. Mall, was published, under the title *Franklin Paine Mall; the Story of a Mind*. Previously Dr. Sabin had written a sketch of Dr. Mall's life for *Biographical Memoirs*, compiled by the National Academy of Sciences. The full biography of Dr. Mall was called "a model of its kind," the New York *Times'* critic writing: "Dr. Sabin has written a vivid life of Dr. Mall. She was well equipped for the task; herself a distinguished teacher and investigator, an associate and pupil of Mall for twenty years, no one understood so well the gifted and somewhat whimsical personality, or followed more closely his scientific work, or could better render its meaning in non-technical language."

Dr. Sabin's career has included several prominent "firsts." In December 1944 she was elected to honorary life membership in the New York Academy of Sciences. She was the first woman to teach at Johns Hopkins Medical School, the first woman member of the Rockefeller Institute (of which she is now member emeritus), the first of her sex elected to the National Academy of Sciences, and the first to serve as president of the American Association of Anatomists. In March 1945 the American Cancer Society announced the appointment of Dr. Sabin to a committee of five leaders in the cancer field who will direct a comprehensive program of research on cancer.

Dr. Sabin is a member of the board of John Simon Guggenheim Memorial Foundation and Finney-Howell Research Foundation; and she is a member of several scientific organizations, including the National Tuberculosis Association and the American Association for the Advancement of Science. She also belongs to the Cosmopolitan Club, the American Women's Association, and the Society of Colonial Dames. Dr. Sabin holds honorary degrees from a dozen leading universities and has also received the National Achievement Award (1932) and the M. Carey Thomas Prize (1935). In June 1945 she was awarded the Trudeau Medal of the National Tuberculosis Association; it is given annually for "meritorious contribution to the cause, treatment or prevention of tuberculosis."

Florence Sabin has been described as a woman with a "marvelous personality," a kindly face, keen eyes, and a warm smile. Possessing a wide vision, she has not kept her imagination within the walls of the laboratory but has recognized the necessity for large-scale application of medical science to all people through endowed hospitals, hospitals for group nursing, and group medical insurance. "Dr. Florence Rena Sabin," wrote Alice Booth, "is the only person I have ever known who—if she had the power of choice—would live her life over again exactly as it was, trying to do just the same things."

SARGENT, (HAROLD) MALCOLM (WATTS) Apr. 29, 1895- Conductor

Address: 20 Chesham Place, London, S.W.1., England

Malcolm Sargent has been called Britain's "ambassador of music" because he has brought British music to such widely separated places as Australia, Sweden, and America. His most recent journey brought him, for the first time, to the United States in the spring of 1945 as guest conductor of the National Broadcasting Company Symphony Orchestra, of which Arturo Toscanini '42 is conductor. He first gained international recognition in the early thirties when he was chosen by Artur Schnabel '42 as conductor for the pianist's recording of the five Beethoven concertos.

Harold Malcolm Watts Sargent was born in Stamford, Lincolnshire, England, on April 29, 1895. His father was Henry Edward Sargent, a church organist. At the age of six the boy was singing alto in the church choir and had said he wanted to be a musician. By the age of ten he had become an organist. "He bought his first piano score of *Messiah* for a penny," relates British critic C. B. Rees, "and knew it backwards at an age when most people have never heard of it at all." Sargent was educated at Stamford School, where he also studied music, and he became an Associate of the Royal College of Organists and won the Sawyer prize in 1910, while still a pupil at the school. In 1911 he was articled to the organist of Peterborough Cathedral, Dr. Keeton, with whom he remained until he received his B.Mus. degree in 1914. In that year he became organist of the parish church of Melton Mowbray in Leicestershire. Although the First World War, during which he served with the Twenty-seventh Durham Light Infantry, seriously interrupted his musical activities, Sargent, already a noted organist, was able to take his D.Mus. degree in 1919. From 1919 to 1921 he studied with Benno Moiseiwitsch, famous Anglo-Russian pianist, and is said to have played remarkably well for his limited experience.

Sargent's introduction to the conductor's podium was accidental. At the last moment a rehearsal of *The Gondoliers* in Stamford was jeopardized when the conductor failed to appear, and young Sargent was urged to take the baton. In 1921 the late Sir Henry Wood, one of Britain's foremost musicians and founder and conductor of the Queen's Hall Promenade Concerts, heard Sargent conduct his own composition, *Impressions of a Windy Day*, in Leicester and invited the young conductor to present it at Queen's Hall. Wrote violinist Bernard Shore in *The Orchestra Speaks* of the Queen's Hall rehearsal of this work: "A vivid memory remains of an extremely thin and wiry young man with flying arms, crashing with a breathless orchestra through . . . the piece. . . .His stick moved so fast that it could scarcely be seen but seemed to make a blur like the spokes of a fast-moving wheel. And all the time he was rehearsing he never stopped talking." In 1922 Sargent went back to Leicester to become musical director and conductor of the Leicester Symphony Orchestra, still one of his many activities. In 1923 he was appointed junior orchestral conductor and musical instructor at the Royal College of Music in London, where today he is a professor of music. In 1924 he conducted the premier of Vaughan Williams' opera *Hugh the Drover* for the Royal College of Music and the British National Opera Company. A year later in Manchester he conducted the first performance of Gustav Holst's opera *At the Boar's Head*, and thereafter conducted the standard repertory with the British National Opera Company.

In rapid succession at about this time Sargent also became conductor of the Lord Palmer's Patrons Fund Concerts (from 1924), the British Women's Symphony Orchestra (from 1925), the Llandudno (North Wales) Orchestral Seasons (1926-28), the annual pageant production of Coleridge-Taylor's *Hiawatha* at Royal Albert Hall (from 1926), the Diaghilev Ballet Russe's London season (from 1927), and the Gramophone Company's orchestra (H.M.V. Records); musical director and conductor of the London season of Gilbert and Sullivan operettas given by the D'Oyly Carte Opera Company (from 1926), and musical director for British International Pictures (from 1931). (Except where indicated, he is still, in 1945, connected with these enterprises.) In 1929, in collaboration with the late Mrs. Samuel Courtauld, he established the Concert Club in London which annually presents the Courtauld-Sargent Concerts.

It was also in 1924 that Sargent began his long association with the Robert Mayer Concerts for Children. For these, relates Bernard Shore, he begins with a brief rehearsal immediately before the performance. "Then . . . the orchestra assembles again and he introduces to the children the particular section of the orchestra with which he is dealing, whereupon the whole vast audience of the Westminster Central Hall becomes as quiet as in church. He holds them fast in his hand while in an effortless and brilliant little lecture he describes the orchestral instruments, and gives a concise and imaginative explanation of the program. Sargent has blessed this generation of children with something unknown to the children of the past. His power lies in his ability to express himself in terms any child can understand. Then after the talk, he does what few other conductors could achieve with so little time, giving a first-class performance of the program. . . .His understanding of the child-mind is perfect, and even hardened orchestral players enjoy seeing happy relations between him and his Saturday morning audience."

Beginning with the Royal Choral Society, of which he was appointed conductor-in-chief in 1928, Sargent has likewise made a name for himself as a choral conductor. Today, in addition to conducting the Royal Choral Society in London, he is the regular conductor of the Bradford Festival Choral Society, the Huddersfield Choral Society, and the Leicester Philharmonic Choral Society. Much in request by choral as well as symphonic societies all over the country, Sargent has also shared the direction of several Leeds choral festivals with Sir Thomas Beecham '41 and led the first performance of William Turner Walton's '40 *Belshazzar's Feast* at the Leeds Festival in 1931. "As a choral conductor," says C. B. Rees, "he has no superior and few equals. His clear, vigorous beat, his communicable energy, his mingled charm and discipline make him an ideal interpreter and trainer where large choral forces are concerned." "To see him at work with a choir at a country festival is, perhaps, to see him in his most inspired moments," wrote Bernard Shore in 1938. "He is able to instill into the singers a life and efficiency they never dreamed of. You have only to see the eyes of a choral society screwing into him like hundreds of gimlets, to understand what he means to them. He is hypnotic with the choir—he plays upon the imagination and minds of the singers like a mesmerist. The Royal Choral Society is a wonderful instrument in his hands."

In 1936 Sargent went to New Zealand and Australia to give a series of concerts for the Australian Broadcasting Commission. In 1937 he conducted the Coronation concerts of the Palestine Orchestra in Jerusalem. Again in 1938 and 1939 he made his second and third Palestinian and Australian tours. At the beginning of the Second World War he returned to England to offer his services to his government but was told that his most valuable contribution was his music. During the War, therefore, he conducted in blitzed towns and cities, during air raids, before workers on their lunch hour, "doing much to sustain morale and keep alive the love of music in circumstances of great trial and continuous strain." Typical of his spirit was an incident which occurred in a northern provincial town when the air-raid siren sounded: he turned to his audience with the words, "Anybody who wants to go can do so now. But the orchestra will carry on. We may be killed, but we shall play something that Hitler '42 can never kill." Then lifting his baton, he signalled to the players, who crashed into the opening bars of Beethoven's Fifth Symphony. Needless to report, the audience remained. Since V-E day Sargent has given concerts in Sweden, Portugal, and the United States, as well as in England, where, in addition to his standard routine, he has guest-conducted with the London, Liverpool, Bristol, and Portsmouth Philharmonic Orchestras, with the Scottish Orchestra and at the Brand Lane and British Museum Concerts.

British Official Photo.
MALCOLM SARGENT

"You wonder when he ever stops and why," says C. B. Rees. "That is your first impression of Malcolm Sargent, slim, wiry, alive and tingling in every nerve, immaculate too, and with his thick black hair shining and undisturbed in the most frenzied climax. His frame looks too frail for the energy it contains—but he is one of the hardest working conductors in the world, and this despite a long and trying illness some years ago. . . .He rushes from one end of the country to another, takes an orchestra in hand at rehearsal in the morning, say, in the North of England; then immediately after the concert at night he is in the train speeding south, studying his score [he always uses a score], for, perhaps, a performance of Bach's mighty B minor Mass, before an audience of five thousand people at the Albert Hall, London. He is a non-stop worker [and] on Sunday afternoon you may hear him as a guest in the now famous radio *Brains Trust* [the British equivalent of *Information Please*]. . . .With orchestra and chorus he is efficient and unfussy. He knows what he wants and how to get it. His tastes are wide and generous, [ranging through both modern and classical works] and his versatility is a thing to wonder at." In 1942 he was awarded an honorary Doctor of Music degree by Oxford University.

Sargent was married in 1923 to Eileen Laura Harding, daughter of Frederic Horne of Drinkstone, Suffolk, and they are the parents of a son, Peter. When not serving the cause of music, Sargent relaxes at the theater or zoo, or rides. His clubs are the Garrick, Beefsteak, and Pratt's.

SCHAIN, JOSEPHINE (shān) Consultant on international relations; social worker; lecturer
Address: h. 3 Mitchell Pl., New York City

In the words of the *American Magazine*, Josephine Schain is "one of the most versatile women in the world. Organizer, businesswoman, diplomat, cook, geologist, basketweaver . . . calm, decisive, she can tie knots, cook 'slum,' or crack a diplomatic whip over a conference of internationally minded ladies." The first woman appointed to represent the United States at a conference of the United Nations, she has attended more international conferences than most people can call to mind, has served as national director of the Girl Scouts of America, and has spent thirty years working through dozens of organizations for woman suffrage, disarmament, permanent peace, and international organization.

JOSEPHINE SCHAIN

The daughter of Jacob Theodore and Irene (Burdick) Schain, Josephine Schain was born in Brown's Valley, "up where Minnesota juts into South Dakota." Brown's Valley is bounded, according to Delos Lovelace, by two lakes, one flowing into the Gulf of Mexico and the other into Hudson Bay, symbolic, it would seem, of Miss Schain's future internationalism. Her mother was "advanced," and Josephine, a tall, rosy-cheeked brunette, studied law at the University of Minnesota, where she was elected to Pi Beta Phi, and received her LL.B. in 1908. She never practiced law, however, but became a social worker in Minneapolis. A member of the International Alliance of Women for Suffrage and Equal Citizenship, Miss Schain was active as a speaker in the 1915 campaign for the passage of the Nineteenth Amendment, which provided that the vote could not be denied anyone on the ground of sex, and which became a part of the Federal Constitution when finally ratified in 1920.

In 1916 Miss Schain went into settlement work; two years later she went to New York to work in a settlement house on the teeming, polyglot lower East Side. But she had a strong interest, also, in international affairs, and in 1924 she became director of the Department of International Relations of the five-year-old League of Women Voters, which Carrie Chapman Catt '40 had founded in 1919. While in this post Miss Schain helped Mrs. Catt organize the National Committee on the Cause and Cure of War in 1925; attended the Institute of International Relations at Geneva in 1926; won her M.A. in International Law; and attended several sessions of the League of Nations. Her term as director ended in 1928, but Miss Schain continued her activities for international good will. She was one of a deputation of three women sent to the London Naval Conference in 1930 by the National Committee on the Cause and Cure of War.

An enthusiastic camper who pitched her tent in the Arabian Desert and South Persia as casually as in the Rocky Mountains, in 1930 Miss Schain was elected national director of the Girl Scouts of America, with her office in New York. In this position, to quote the *American Magazine*, she was for five years "the head of a family of 333,840—all girls"—and "controlled a million-dollar organization." At the same time she continued her internationalist activities. In 1931 she was one of the two United States delegates to the Geneva meeting at which the Women's Peace and Disarmament Committee was formed, and two years later Miss Schain became a member of the board of the International Alliance of Women for Suffrage and Equal Citizenship. She was the only American woman observer at the Geneva Disarmament Conference in 1933. In May 1935, her second year as chairman of the National Committee on the Cause and Cure of War, Miss Schain headed the American delegation to the International Alliance's triennial conference at Istanbul, and also led its Peace Committee. The thirty-year change in women's status was highlighted at this conference, where the largest delegations were from India and Egypt, when the recently emancipated Turkish women joined in denouncing the Nazis' curtailment of the rights of German women. (The principles for which the Alliance stood were equal political, moral, economic, and legal rights for both sexes, and peace and support of the League of Nations.)

Miss Schain returned to America in 1935 convinced that there was a real desire for peace in every country, including the dictatorships. The next year, however, saw the founding of the Rome-Berlin Axis and the beginning of a world-wide armament race. This was the background for the Universal Peace Congress of October 1936, at which Miss Schain was one of fifty-eight United States delegates. (Earlier, she had made some speeches for the re-election of President Franklin D. Roosevelt '42.) Among the five thousand delegates from every country in the world were six hundred women, representing women's organizations with a total membership of forty-five million. The Congress decided to attempt to coordinate the work of all the peace forces in the world, and Miss Schain was given the "unprecedented honor" of heading the Commission on Women's Organizations, made up of their six hundred representatives.

The next month Miss Schain represented the National Committee on the Cause and Cure of War at the People's Conference in Favor of Peace, and came into conflict with Doris Stevens, chairman of the International Commission on Women, which was set up by the sixth Pan-American Conference. Miss Stevens, who had the advantage of Miss Schain in being able to address the Latin-Americans in Spanish, drew up a resolution to be presented to the Inter-American Conference for the Maintenance of Peace, at Buenos Aires, urging all member nations to make laws guaranteeing women unqualifiedly equal rights with men. In the recurrent debate as to whether or not such laws would defeat their own purpose, Miss Schain held the latter opinion, and declared that all the United States delegates were pledged to support it, having been "hand-picked" by Carrie Chapman Catt for the purpose. The Stevens resolution was passed by acclamation, however, with the support of all the United States delegates except Miss Schain and Helen Hayes '42, who represented the YWCA. The controversy was carried to the Buenos Aires conference in December 1936, where it occupied the entire attention of all delegates for a time. (Miss Schain was one of a large United States delegation headed by Secretary of State Cordell Hull '40 and Under-Secretary Sumner Welles '40, and joined by President Roosevelt.) Here she opposed the resolution on the ground that woman suffrage in its international aspect was already under study by the International Labor Office at Geneva, and that all discussion should await its findings. The situation was finally resolved by a compromise.

As war approached, Miss Schain gave lectures on the need for a stronger State Department and a stronger United States foreign policy, as well as on the need for educating children for peace. (She was a member of the executive committee of the Committee for Non-Participation in Japanese Aggression.) In 1937 she was a delegate to the Conference of the Women's Pan-Pacific Association in Vancouver. In that year Miss Schain's services to women and to the world were recognized by Smith College, which awarded her an honorary LL.D. In addition to serving on committees and associations directly concerned with international affairs, Miss Schain has also energetically aided the work of other organizations, including the General Federation of Women's Clubs, the American Association of University Women, the YWCA, and the National Council of Jewish Women, as consultant in international relations. Between conferences she lectured and traveled widely, having by 1943 run up a score of nine trips on the Continent, two journeys through the Near East and Russia, and one visit to South America. In 1940 she was chairman of the executive committee of the Women's Centennial Congress.

Josephine Schain became in May 1943 the first woman to represent the United States at a United Nations conference, having been appointed by Secretary Hull, with the President's approval, as one of six delegates to the Conference on Food and Agriculture at Hot Springs, Virginia. (The United States advisers and technical secretariat included five other women, all doctors specializing in food and nutrition.) Miss Schain was there as representative of the Commission to Study the Organization of Peace; the other American delegates were all experts on health, commerce, and agriculture, and she was the only woman delegate of any of the forty-five nations represented.

In January 1944 Miss Schain undertook to conduct a department, *Invitation to Information*, in the *Independent Woman*, organ of the National Federation of Business and Professional Women's Clubs. In it she gave a series of outlines and bibliographies for international questions. That October the Federation's new president, Margaret A. Hickey '44, appointed her to a two-year term as chairman of the Committee on International Relations, which she had headed from December 1931 to November 1934. In 1945 the State Department invited forty-two civic, social, labor, agricultural, and professional groups to send two consultants each to the American delegation at the United Nations Conference on World Organization, which opened in San Francisco in April 1945. The Federation sent Josephine Schain. A member of the executive committee of the Committee on Participation of Women in Postwar Planning, Miss Schain expressed satisfaction at the representation of women at the conference. "Besides the official women delegates from ten countries," she told reporters, "there are innumerable women at San Francisco as advisers, technical people, consultants, et cetera, including important women representatives from France, Norway, and Colombia. Don't you think that's pretty good?"

At the nine-week conference Miss Schain and the other women were divided on the question of including in the Charter of the new world organization a provision "guaranteeing and serving to establish the eligibility of women, as well as men, to serve as representatives of their nations in these organs and agencies where membership is accorded nations." This proposed provision, set forth by "a strongly united and articulate bloc of Latin-American women," was opposed by women from countries where their rights were more extensive, particularly by the British Ellen Wilkinson '41 and Florence Horsbrugh; but the Latin Americans finally convinced them that such a provision was indeed necessary to establish the opportunities for women of the Latin nations. Later in the year Miss Schain was sent as a delegate to the United Nations Conference on Food and Agriculture at Hot Springs, Virginia, the purpose of which was to study the nutrition needs of the world.

Josephine Schain is described as a tall, handsome woman of full figure, with strong features, dark brows which contrast with her silvery white hair—and unexpected dimples when she smiles. "Her blunt words," according to Gledhill Cameron, "are leavened by good sense and good humor." In her spare

SCHAIN, JOSEPHINE—*Continued*

time she likes to write poetry; she is fond of gardening, and "can ride, swim, hike, and camp with the best of the Girl Scouts." In addition to Miss Schain's membership in innumerable committees and associations, she is a member of the Cosmopolitan and Pen and Brush clubs of New York, and the Women's University Club of Washington, D.C. Miss Schain is unmarried, and makes her home in New York.

SCHWELLENBACH, LEWIS B(AXTER) (schwĕl'ĕn-bäk) Sept. 20, 1894- United States Secretary of Labor; lawyer

Address: b. Department of Labor, Washington, D.C.

Six weeks after Harry S. Truman '45 was sworn in as President of the United States he announced the appointment of a new Secretary of Labor—Lewis B. Schwellenbach. Successor to Frances Perkins '40, who had been the target of much criticism in the twelve years she held that key Cabinet post, Schwellenbach was a Federal district judge and former Democratic Senator from the State of Washington. A fighting liberal closely identified with the policies of Franklin D. Roosevelt '42, he is generally well regarded in labor quarters.

As his name indicates, Lewis Baxter Schwellenbach is of German descent, the son of Frank William and Martha (Baxter) Schwellenbach. He was born September 20, 1894, in Superior, Wisconsin, but when he was a small child the family moved to Spokane, Washington. When the child was still quite young his father died, and at the age of eight Lewis was selling newspapers to contribute his small bit to the family's support. He attended Washington Grade School and South Central High School, where he developed a taste for debate. He was ambitious for a legal career, and after high school worked his way through the University of Washington, earning his LL.B. in 1917. During his university days he had demonstrated a flair for debate and politics and had organized the Woodrow Wilson Club on the campus.

Schwellenbach began his professional career as an assistant instructor in the university's department of liberal arts, but after the United States declared war on Germany he entered the Army as a private in Company M of the Twelfth Infantry Regiment. When the war was over he did not return to teaching. He was admitted to the Washington State bar in 1919 and became associated with the Seattle law firm of Roberts and Skeel, with whom he remained for two years. As an Army veteran he was also an active member of the American Legion, serving as a department commander in 1922-23.

In 1924 the rising attorney became chairman of the Democratic State Convention. The following year, with two other men, he formed the law firm of Schwellenbach, Merrick and Macfarlane, an association that lasted for six years. It was also in 1925 that he helped organize the North Coast Bank and Trust Company, of which he became president in 1930. In 1931 Schwellenbach decided to carry on his legal practice alone. For the next few years he represented several financial institutions in the Pacific Northwest affiliated with the Brotherhood of Locomotive Engineers. In that period, also, his prestige on the political scene increased. He had been chairman of the King County Democratic Committee from 1928 to 1930, and in 1932 he was the party's candidate for Governor in the primaries. The liberal lawyer ran on a platform of State operation of idle farms and factories for the benefit of the unemployed. Although unsuccessful in his candidacy, he continued his political activities, in 1934 becoming a candidate for the United States Senate from the Evergreen State. With the help of the American Legion, Schwellenbach carried on a victorious campaign under the slogan "End poverty in Washington."

Succeeding Senator Clarence C. Dill, who had coached him in oratory in high school, Schwellenbach took his seat in the Senate early in 1935. Even as a freshman Senator he made his presence felt (contrary to customary Senate procedure), in his first session leading a group of other newly elected Senators in an attempt to force a showdown on Huey Long's filibustering. His voting record soon demonstrated that he had liberal and labor leanings. He supported liberal relief expenditures during the depression, antilynching legislation, the utilities holding-company bill, reciprocal trade agreements, the wage-hour and the Wagner '41 labor acts, expansion of old-age pensions, and the Hatch '44 clean politics bills.

As a member of the Foreign Relations Committee, from 1937 he campaigned in and out of the Senate against the sale of scrap iron to Japan, sponsoring legislation to prevent its shipment. He was an active member of the Senate Lobby Investigating Committee headed by Hugo L. Black '41, and on occasion conducted committee hearings, demonstrating his ability in prosecuting the investigations. According to one writer, Schwellenbach, Black, and Sherman Minton '41 were the "Three Musketeers of the Senate." In the course of his career in the Senate Schwellenbach was also a member of the Robert La Follette '44 Civil Liberties Committee, chairman of the special committee on conservation and utilization of aquatic life, and a member of the regular committees on Agriculture and Forestry, Claims, Immigration, and Pensions.

Early in his Senatorial career Schwellenbach had indicated strong sympathy with President Roosevelt's policies. Another Senator who had entered the legislature at the same time that Schwellenbach had was Harry S. Truman from Missouri, and the two freshmen became close friends. Together with Carl Hatch and Sherman Minton, they were known as the "four young Turks" in the Senate vanguard of the New Deal battle line. The Washington Senator attracted attention with his denunciation of the "Economic Royalists"; in 1937 Carlisle Bargeron in the *Nation's Business* called him the chief denouncer for the New Deal in the Senate. He "revels in the fight," wrote Bargeron, "and in bitterness and acrimony he has no worries about coming out second best." In the course of Schwellenbach's five years as New Deal stand-by in the Capital, Delos Lovelace reports, he was usually around when things were happening, "especially if the heads were rolling."

Among Administration measures which Schwellenbach supported was the hotly contested Supreme Court reorganization bill. Later he rallied to the Administration's defense when Roosevelt policies were under attack by the American Liberty League, a conservative organization largely supported by big business interests. In February 1936 he declared, "I am not one who holds the theory that the businessmen are in themselves public enemies who should as a group be condemned in the discussion of political problems. My criticism of American business is its inconsistency. It is constantly asking for governmental assistance, either financial or in the form of legislation which will assist the particular branch or industry in which the particular proponent of the particular legislation may be interested. At the same time American business is constantly criticizing the financial policy of the Government and the regulatory acts adopted by the Government." Again the militant Senator clashed with a scion of big business when, in March 1936 he devoted two days in the Senate to an "exposé" of the career of William Randolph Hearst. Some weeks later the Hearst newspapers carried a series of articles entitled *Lewis the Laundryman*, dealing with alleged manipulations of a Seattle concern, Superior Service Laundries, Inc., of which Schwellenbach was president. The Senator replied that this matter had been completely "thrashed out" during his Senatorial campaign.

In March 1938, in a discussion of the subject "Depression or Recession," Schwellenbach suggested that small business should be helped by making available adequate credit facilities. Analyzing the reasons for the country's depressed economic condition, he said, "But it seems to me that the most adequate explanation of the present business condition is to be found in the undeniable fact that private enterprise failed to take up the slack occasioned by the curtailment of the Government's spending program." He appealed to industrialists to cooperate with the Government in bringing about a business revival. Also treating current labor conditions, he talked of the effect of controversy between labor groups: "I feel that in most fights between employees and employers the scales of public opinion are weighted in favor of those who work. That same favorable public reaction does not exist when organized labor fights within itself. . . .We need and we must have cooperation between government, industry, and labor. The preservation of American democracy justifies it, and demands it."

LEWIS B. SCHWELLENBACH

During his term of office Schwellenbach made several radio addresses, discussing such topics as tolerance, relief, the evils of dictatorship, Roosevelt's recovery program. One of his talks, "The First Seven Years of the New Deal," was reprinted by *Vital Speeches* in March 1940. Recalling the President's actions when he took office in the depths of the depression, the Senator declared, "Never in our history has one man accomplished what Roosevelt did then." He weighed the assets and liabilities of the New Deal, answering its critics with facts and figures. On the labor issue, he commented, "So long as we have the Weirs '41 and the Girdlers '44 dominating our industrial scene, just so long will we have labor controversy."

In May 1940 President Roosevelt appointed Schwellenbach to the post of Federal district judge of the Eastern District of Washington State. In line with Senate tradition, his colleagues gave the appointment immediate confirmation without referring it to the Judiciary Committee for hearings. As it was, Schwellenbach did not don his judicial robes at once, preferring to wait until the end of the Congressional session in December. The judgeship was considered in some quarters a reward for the outspoken New Deal Senator.

(Continued next page)

SCHWELLENBACH, LEWIS B.—*Cont.*

Before he left the Senate, however, Schwellenbach was to oppose the Administration on a vital issue. In September 1940 he voted against conscription, the first time he had ever opposed the Administration on a major issue. In a speech on the Senate floor on August 28 he explained his decision to vote against the conscription measure and the Russell amendment (an amendment to the Selective Service Act providing for conscription of industry under certain conditions). Pointing out that peacetime conscription is an historical departure for America, Schwellenbach added that if one accepts the principle of conscription of men, then, logically, it must be extended to industry, and "when the time comes and we reach the logical conclusion of the course which this bill proposes, necessarily the system of free economics in this country must be destroyed."

In the first weeks after Truman had taken office as President rumors persisted that there would be a shakeup in the Roosevelt Cabinet. Among those mentioned for replacement was Secretary of Labor Frances Perkins, who had held her post for the twelve years of Roosevelt's Administration; and as early as April 26 the New York *Times* reported that Judge Schwellenbach was a prominent possibility for the Labor secretaryship. On May 23, less than a month later, Truman announced the first of his Cabinet changes, naming the jurist for Miss Perkins' post. A few days later the Senate Education and Labor Committee unanimously approved the nomination and on May 31 the full Senate seconded it by unanimous vote. Marquis W. Childs '43, pronouncing the choice excellent, added that the President had informed Schwellenbach that he "intended to restore to the Labor Department all the powers that had slipped away during the long tenure of Secretary Perkins. This was one of the arguments he used in persuading his friend to give up a Federal judgeship to come to Washington."

Columnist Thomas L. Stokes, in discussing the appointment of the Washingtonian, noted that the Pacific Coast was taking its place in the Cabinet and the "West gets a break." *PM* had referred earlier to his "splendid" Congressional record. Editorially the New York *World-Telegram* praised the appointment, looking forward to coordination within the Labor Department. Along similar lines, the New York *Herald Tribune*'s editorial hailed the change in the Labor secretaryship and expressed the belief that Schwellenbach would make a good Secretary. The reaction of labor was favorable, A.F. of L President William Green '42 enthusiastically greeting the new Secretary. *PM* indicated that it was understood that CIO sentiment also favored the Presidential appointee. (Schwellenbach's labor standing was demonstrated during the last general election when both A.F. of L. and CIO leaders in his state urged him to run for Governor or the Senate.) Announcing the new Cabinet members (Secretary of Labor, Attorney General, and Secretary of Agriculture), White House officials made it clear that the appointees were to have a free hand in reorganizing their departments. It was reported that the WLB and various independent labor agencies would be consolidated within the Labor Department and former powers of the Department would be restored. Commenting on the apparent shift in labor policy, the *United States News* pointed out that, while in recent years the Labor Department had become "principally a statistical agency, Judge Schwellenbach's idea is that it should be run impartially, as a court is run."

The new Secretary of Labor took office on the first of July. In his first "general order," approved by President Truman and issued through the White House, Schwellenbach directed all Labor Department employees to execute the laws as they stood, and explained that the order was sent out because, "after six years in the Senate and four and a half years on the Federal Bench, I know there is a tendency in the executive branch to interpret the law the way an administrative officer thinks it should be instead of following the law as written by Congress and interpreted by the courts. I am not going to allow that in my department."

Schwellenbach's first direct approach to the public was a speech over the radio, in which he warned both labor and management that industrial peace and creation of jobs were a joint responsibility. He also made it clear that he considered his Department as "obligated to protect the welfare of all workers, unorganized as well as members of trade unions." In a Labor Day radio address from Washington, Schwellenbach further warned organized labor to assume responsibilities for the public good or risk Federal controls. Schwellenbach early made known his appointment of Edgar L. Warren, chairman of the War Labor Board in Chicago, as chief of a reorganized United States Conciliation Service. Commenting on plans to strengthen the Conciliation Service, Schwellenbach stressed his belief in collective bargaining. (The size of the Government's conciliation task was indicated in a wartime report of the Conciliation Service which revealed that from December 7, 1941, to August 1, 1945, it handled 75,653 disputes, and of this number 57,537 cases were settled by the service through processes of arbitration.)

After a series of conferences with the three top labor leaders Schwellenbach indicated that the Bureau of Labor Statistics would be reorganized "because its work is too academic and not realistic enough." Early indication that other important changes were in order was confirmed when President Truman disclosed on September 18 that he had transferred all the powers and operations of the War Labor Board, the War Manpower Commission, and the United States Employment Service to the Labor Department. Eventually all labor functions of the Government were to be centralized within the Labor Department as far as possible.

In the midst of a threatened resumption of the prewar labor-industry conflict, plans were accelerated for a management-labor conference which President Truman had announced shortly after V-J Day, to be held in Washington beginning November 5. Weeks before the meeting could take place, however, the nation was faced with a record number of strikes or impending strikes involving such basic needs as coal, steel, oil, telephones, shipping, and motors. Leading industrialists as well as labor chiefs were called to Washington as a preliminary to the labor-management conference for consultation in the creation of a new wage and labor policy. In October Schwellenbach also testified in behalf of important pending legislation affecting labor. He commended the Pepper-Morse equal pay bill, "not only as a matter of fairness to women but also from the standpoint of preserving wage standards and consumer purchasing power." Schwellenbach also strongly advocated legislation to raise the legal minimum wage to 65 cents an hour, declaring that price control could be maintained without danger to industry. In urging adoption of the full employment bill, he condemned the views of those who wanted a "cheap labor" pool which would reduce production costs. However, Schwellenbach took occasion, in an address before the New York *Herald Tribune* Forum on October 31, to blame both sides in strikes, declaring that "collective bargaining is not collective bludgeoning."

In the first week of November, when he appeared at the final hearing on full employment legislation, Schwellenbach said the Administration had withheld suggestions on labor legislation so that it could not be accused of interfering or prejudging the labor-management conference then in session. Secretary of Labor Schwellenbach and Secretary of Commerce Henry Wallace were the Administration's two representatives in the conference. Limited in number so that it would be a real working group, it was composed of thirty-six delegates, who had been chosen by spokesmen for labor and industry. After four weeks of intensive discussion, the labor-management conference adjourned on November 30, having failed to set up a plan to avert work stoppages when collective bargaining and mediation failed.

Acting with speed President Truman recommended fact-finding by a Government board as a possible solution to end strikes which interfered with the public interest. On certification of the Secretary of Labor that a dispute would vitally affect the public interest, the President would be authorized to appoint a fact-finding board within the next five days. Earlier in the year Schwellenbach had already warned oil-industry heads and labor leaders when summoning them to Washington for a parley that "the time was rapidly approaching when the American people as a whole were going to take some stand on these questions." President Truman asked Congress for fact-finding legislation with the idea in mind of trying to force both sides to come to some sort of agreement or else risk stronger Government interventions later. By the end of the year fact-finding boards were engaged in the attempt to settle two of the country's most important disputes, those in the oil refineries and in General Motors' plants. Although their efforts were not very successful, the President wanted to give the fact-finding idea a thorough trial before taking other measures. His main concern was that Congress would "quickly" enact the necessary legislation. At his press conference on December 20 President Truman stated that one of his main purposes in asking Congress to vest fact-finding boards with power of subpoena was to enable them to examine the books of an employer "to determine the ability of the employer to pay an increase in wages." Secretary Schwellenbach the next day said that fact-finding boards "must necessarily inquire into the issue of the employer's ability to pay," and moreover that they might "inquire into production and other costs where relevant."

Lewis Schwellenbach has taken an active interest in educational affairs. In 1933 he was appointed president of the board of regents of the University of Washington; he served as president of the board of Washington State College from 1941 to 1944, and in September 1944 he was appointed dean of the Gonzaga University Law School in Spokane. The jurist also served as president of the alumni association of his alma mater in 1928-29. Schwellenbach was a delegate to the Inter-parliamentary Union at The Hague in 1938. He is a member of the American Bar Association, the American Society on International Law, and the Regional Board of Legal Examiners in Spokane. His extensive organizational affiliations include membership in the American Council of the Institute of Pacific Relations, the American Academy of Political and Social Science, the Rotary Club of Spokane, and the advisory board of the Salvation Army in that city. A member of three fraternal orders, Schwellenbach is an Elk, an Eagle, and a Woodman. In 1945 he received an honorary LL.D. degree from the State College of Washington.

His Senate friends agree in their description of him as "able, independent, brilliant intellectually, and a liberal at heart." A friend of two Presidents, Schwellenbach is regarded as a sober, hard-working man, endowed with "tremendous force and energy." During the early and middle years of the Roosevelt Administration, when the Washington Senator was called upon to act as Administration trouble shooter, the late liberal Senator George W. Norris said of him, "Schwellenbach is the coming hope of the United States Senate." The Secretary is a large figure, six feet tall, and he weighs about two hundred pounds. He has dark hair and wears horn-rimmed glasses. During his first year as a Senator (1935) he was married to his secretary, Anne Duffy, in Chicago on December 30. For recreation the Westerner likes to spend evenings at home with books and cigars.

SCOBIE, RONALD M(ACKENZIE) June 8, 1893- British Army officer

Address: b. c/o War Office, London; h. Cleeve Hill, N. Cheltenham, Gloucestershire, England

On a day in December 1944, while the Greek civil war was raging in the streets of Athens, a British Army officer, wearing a red-banded general's cap and many medals, stood calmly erect in the front seat of a scout car as he

British Official Photo.

LT. GEN. RONALD M. SCOBIE

drove through snipers' bullets. This officer was Lieutenant General Ronald M. Scobie, commander of the British Land Forces of the Adriatic, and, after the beginning of the Greek uprisings, commander in chief of Allied forces in Greece. Not one of Britain's headline commanders, according to the press, but "one who has never flopped," General Scobie is a veteran of the First World War and, in the Second World War, the former commander of the besieged fortresses of Tobruk and Malta. He was thought by many to have been in the "toughest" spot in his career during the forty-day fighting in Greece.

Ronald MacKenzie Scobie was born June 8, 1893. Though little information about his early life is available, one may assume that he spent it in Scotland as he is known to have played for Scotland in international rugby football matches against England, Ireland, and Wales in 1914. He entered the British Army in February 1914 and was commissioned a second lieutenant in the Royal Engineers in August, soon after he was twenty-one. In October young Scobie landed in France and, though wounded shortly after, remained at the front during the four years of the First World War, being mentioned twice in dispatches and winning the Military Cross. He was promoted to captain in 1917, and was made a brevet major in 1919, giving him the nominal rank but not the pay of a major.

Scobie continued to hold that rank in France until September 1920, when he returned to England to take command of a company at Woolwich. He was stationed at the Royal Military Academy from 1920 to 1924; then at Aldershot where he was first a staff captain from 1927 to 1929, and later a brigade major, serving in the command of Field Marshal Lord Archibald Wavell '41. Scobie's next duty was overseas. A graduate of the Staff College and later also of the Imperial Defence College, he was sent to the Australian Royal Military College, where he was director of military artillery from 1932 to 1935.

From Australia Scobie returned to England, and in January 1938 he received another staff appointment—that of assistant adjutant general. His days in the field seemed almost as irretrievably in the past as those when he had played rugby for Scotland, for his next post was again administrative, this time one of high importance: he was Deputy Director of Mobilization from September 1, 1939, to May 8, 1940. He is said to have been a skillful, resourceful administrator in this post. For eight months he worked at the War Office and then, just before Italy declared war, he went out to the Middle East as deputy adjutant general. Scobie had been a brevet lieutenant colonel in 1934, a lieutenant colonel and colonel in 1937, and in 1941 he was made a major general. In August the Italians invaded British Somaliland; Scobie was with the British troops in the Sudan and a brigadier on the General Staff from August 18, 1940, to October 16, 1941.

Throughout the Abyssinian campaign the General was on the staff that planned the gigantic north-to-south pincer movement which broke Italian military power in East Africa. The southern arm of the forces based in Kenya was under General Sir Alan Cunningham, brother of Admiral Sir Andrew Cunningham '41; the northern was under General Sir William Platt, driving in from the Sudan. Scobie was under General Platt advancing in February 1941 to take Agordat, to break the core of Italian resistance in East Africa by the capture of Keren in March 1941, and finally to conquer the whole of Eritrea.

Succeeding General Moreshead as general officer in command of the "beleaguered sandy fortress of Tobruk," Scobie led the British Seventieth Division in by sea to relieve the Australians in October 1941. The Seventieth Division held the fortress, even attacking from it to meet the relieving forces advancing under General Sir Claude Auchinleck '42. This was the second British offensive of the Western Desert, and the advance reached El Agheila. For his campaign in Eritrea and at Tobruk, Scobie was twice decorated, with the Order of the British Empire in 1941 and with the Order of the Bath in 1942.

Marshal Erwin Rommel's '42 counteroffensive followed Auchinleck's advance, and except for a month of the six months that it lasted—from January to July 1942—Scobie was once again on the staff as deputy adjutant general (from February 17, 1942 to August 5, 1942). His next post, as general officer in command or operational commander of what has been called "the still more durable island bastion" of Malta, combined in many ways the work of the last two appointments. He was commanding the troops on the Mediterranean island when it was under siege.

During these months in the summer and autumn of 1942 the fortress of Malta was under continual attack by Nazi and Italian planes. The blockade by sea was also intensified at this time, and the subsequent shortage of food and equipment caused Lord Gort '40 to institute such measures as putting the island on half rations, and cutting fuel consumption to the extent of forbidding the use of light or power all summer. Finally, however, the siege was lifted as the Eighth Army moved swiftly west from El Alamein and the Allied Forces landed in North Africa in November 1942.

After the relief of Malta, Scobie was again given a new appointment, this time as chief of the General Staff in the Middle East, but he had held it only for a few months when he was given "special employment," in preparation for the invasion of Greece in October 1944. It was only after British troops had landed in Greece that it became generally known that Scobie was leading this invasion.

In his address of January 18, 1945, to the House of Commons, Prime Minister Churchill '42 explained, in answer to criticism of Britain's actions in Greece, "We went on the invitation of the Greek Government in which all parties, even the Communists, were represented, and as a result of a military conference at which the generals of ELAS and of EDES were equally present. We brought food, clothing, and supplies. We came with a small force of troops. We took up our positions from no military point of view, spreading our troops in a number of places on the coast and at small points inland, where we hoped to be able to pour in the largest number of supplies as quickly as possible to a very hungry people." (At Caserta, in September, the generals had declared "their full acceptance of the orders of the Greek Government and of the Supreme Allied Commander," under whose orders the Greek Government had placed all Greek forces operating in the country.)

By "small force of troops" Churchill meant the Land Forces of the Adriatic, which, according to *Time* Magazine, are a "small unit of British Commando troops, paratroops, and special service forces under the command of a British Army officer." The group was organized formally during the summer of 1944 and placed under the Allied Balkan Air Force, continued *Time*. It was based in Italy and worked closely with the Navy and Air Force in order to move back and forth across the Adriatic, operating over a front about seven hundred and fifty miles long.

Before the liberation of Greece the Greek Government in Exile had announced that Greek guerrilla factions had agreed to act together under Allied command in the fight against the Germans. Scobie was named commander of Allied operations in Greece, and in October British Commandos were reported to have landed on three Greek islands.

But in October 1944, when Greece was liberated from Axis domination (George Papandreou '44 was Premier and the exiled King George II '43 was waiting in London for a plebiscite on the question of his return to the throne), EAM, the Leftist guerrilla organization, had been growing in power. After the liberation of Greece and the return of the Government to Athens, ELAS, the military arm of EAM, was in almost complete control of the city, where festive celebrations had led to street riots. Said *Newsweek*, ELAS troops held much of Athens and the surrounding countryside by the middle of December, and it became obvious that Lieutenant General Scobie faced a full campaign unless some political solution were found.

In November, after a conference with Scobie, Papandreou ordered all guerrilla groups to disband, and the Greek Communist Party and the EAM resistance organizations agreed to this Government order. On December 1 Scobie broadcast to the Greek people to remind them that the British troops had come, first, to drive out the invader, secondly, to bring relief, and, thirdly, to help restore prosperity. He said that he would stand by the side of the constitutional Government headed by Papandreou until it could be established with a legal armed force behind it and was able to hold free elections, and that he would protect the Greek Government from a coup d'état. Millions of copies of Scobie's proclamation were dropped by planes all over Greece, and the British Government issued a statement approving Scobie's declaration and giving full support to the Papandreou Government. But the unrest and uncertainty continued. *Newsweek* described the Greek situation as "a witch's brew of internal discord and foreign interventions" which was slowly reaching the boiling point.

The crisis did reach the boiling point when a general strike was declared in Athens on December 4, and the British troops disarmed over three hundred Left-wing supporters who had marched into Athens in defiance of the British military rule. Orders were sent to Scobie to take over military command of Athens and to restore and maintain order by whatever measures were necessary—in the words of one commentator, "the normal life of the city came to a halt."

For a while the task of clearing the city of ELAS partisans progressed steadily. British troops supported by strafing planes, tanks, and field artillery continued to hold the center of the Greek capital. By December 11, however, ELAS partisans had filtered back, and bloody street fighting raged in Athens, with over twenty thousand armed Leftist troops sniping and shelling British and Greek Government positions in the heart of the capital. "If I did wrong," Churchill afterward told the House of Commons, "I take the full responsibility. . . . For three or four days, or more, it was a struggle to prevent a hideous massacre in the center of Athens."

Churchill insisted that it was necessary for the British to maintain order by force because the EAM was seeking to seize power and terrorize the country, a charge which the EAM vehemently denied. The EAM leaders also proclaimed that the struggle would continue until the resignation of Papandreou. Scobie was bitterly denounced during these tense days. At one time leaflets addressed to British soldiers containing strong criticisms of him were distributed by the EAM; in these leaflets Scobie with his "murderous orders" was contrasted with Lord Byron, who "gave his life for the liberty of Greece [while] General Scobie supplies arms for its slavery."

On December 12 Scobie informed EAM delegates that under the Caserta agreement they must leave Attica, cease fighting, and surrender their arms before any settlement could be made. Airplanes again dropped leaflets containing this warning. According to *Newsweek*, the reluctance of the EAM leaders to disband was based upon what they considered the fundamental issue of the civil war (the same issue which split other liberated countries of Europe), which they questioned: the Government's right to disarm all soldiers outside the Regular Army. By retaining their arms ELAS leaders declared that they retained their only chance of

SCOBIE, RONALD M.—*Continued*

participating in a new Greek Government and preventing the installation of a monarchist dictatorship.

The next day British headquarters reported two determined ELAS attacks, one on a Greek brigade and the other on British troops. While British reinforcements arrived, ELAS forces shelled the center of the city, especially the headquarters, during that night and the following day. On Christmas Day Prime Minister Churchill and Foreign Secretary Anthony Eden['40] arrived in Athens. A regency was demanded, and King George issued a proclamation naming Archbishop Damaskinos['45] as Regent. General Nicholas Plastiras was made Premier to replace the "British puppet" Papandreou, who had resigned, and, with the formation of a new Cabinet, the strife in Athens seemed to have come to a close. Scobie and four ELAS delegates signed a truce on January 11, 1945, halting hostilities and, although there were some difficulties concerning the question of hostages, the forty-day civil war was considered at an end.

However, Great Britain received little credit, although Scobie was said to have done well with what little he had. There were comments that the British, in the words of the New York *World-Telegram*, "badly underestimated the depth of the situation and arrived with far too little force." In January, reports of the release of a large proportion of the hostages held by ELAS lightened the political situation. ELAS central committee men had authorized the chief of the International Red Cross committee mission there to take possession of all hostages except those considered by ELAS to be responsible for the Greek crisis. Scobie had authorized the chief of the Red Cross mission to arrange for an exchange of prisoners. In January, too, Scobie, in the report of Leland Stowe in the New York *Post*, "forbade correspondents to have any contacts with 'the enemy' (EAM and ELAS representatives), even interviews supervised by British officers. Eleven out of twelve American correspondents appealed to the United States government to intervene so that the American public, 'without any infringement of British military security,' might hear occasionally 'a part of the EAM view of the present conflict.' "

Reports of violence and unrest continued to come from Greece through succeeding months. In July, according to an account in the New York *Times*, "a long document charging that the British had severely abused Greek Left Wingers detained in North Africa since the mutiny of Greek armed forces was made public by Maritpress, recently established in London as a news agency for EAM and ELAS." Following criticism of the official British position made by a delegation of Labor Members of Parliament who visited Greece, and who contended that "free elections were impossible in Greece under present conditions," announcement was made from London on November 6 that Foreign Secretary Ernest Bevin would send Under-Secretary for Foreign Affairs, Hector MacNeil, to Athens. The Foreign Office stated that MacNeil would consult with the new Greek government on "certain aspects" of the problem of speeding reconstruction. There was official denial, however, that there was any intention of withdrawing General Scobie.

General Scobie—who, according to *Newsweek*, is unsuitably known to the Greek press and public as "Mr. Scobie"—is described as a typically soft-spoken, steel-willed British Army officer with a long, ruddy face, slightly aquiline nose, minute mustache, and graying chestnut hair. Tall and lean, with erect military carriage and quick, dignified steps, he has retained a youthful appearance. His official manner is quiet, almost diffident, but his dignity is impressive. *Newsweek* says that his tall, attractive wife and his daughter Jane live at Cleeve Hill, near Cheltenham in Gloucestershire. In 1945 Jane was attending the Cheltenham Ladies' College, and Mrs. Scobie, who before the war traveled with her husband to his posts, was working at a nonprofit restaurant operated by the Britsh Government.

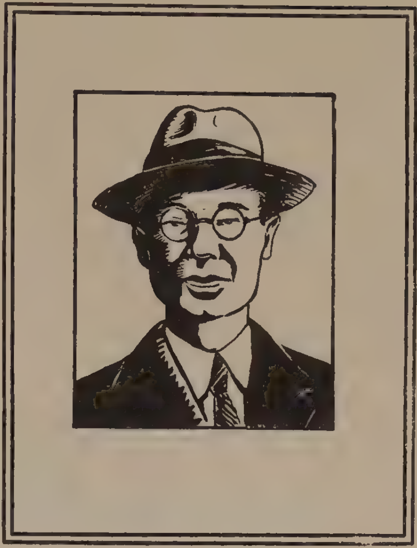
SHAW, LAU (lō) 1898- Chinese author
Address: b. c/o Reynal & Hitchcock, 8 W. 40th St., New York City

One of the leading literary interpreters of contemporary Chinese life has won wide attention in America with the appearance in English of one of his books, *Rickshaw Boy* (1945), under the pseudonym Lau Shaw. He is Shu Ch'ing-ch'un, popular in his native China as a prolific novelist, playwright, and poet. As a writer he has been compared to the great Western classicists who faithfully transcribed the social scenes of their day into vivid indictments of the evils within those societies. According to Lewis Gannett '41, *Rickshaw Boy* "belongs to something more than a Chinese tradition; it reminds one of Gorky and Nexö; it is part of the great stream." This story of a Peking coolie, the first of Lau Shaw's works to appear in America, was the August 1945 selection of the Book-of-the-Month Club, and it was also the subject of a radio dramatization.

Lau Shaw, or Shu Ch'ing-ch'un, is of Manchu descent. He was born in Peking about 1898. (In Chinese calculation a person is one year old when he is born, and a year older after each New Year's Day.) Since the author rarely writes or talks about himself, there is little information about his early life. What is known is that he studied at a provincial normal school where he later taught, and that he also attended Peking University, during which time he wrote stories. Whether he received a degree from the university is unknown, for, in the words of Kay Yang, "The truth is, he never cared to make certain whether he had received one or not. All he had in mind at the time was to go back to teach in his own province and continue to write stories." He devoted several years to teaching until he accepted an opportunity to go to Oxford University to study education.

In London Lau Shaw became acquainted with the late Professor Hsu Ti-shan, a well known scholar and short story writer, who saw promise in the young man's literary efforts. Encouraged by the Professor, Lau Shaw began to write his first novel, *Chao Tze Yueh* ("Mr. Chao Said"). When the book was published about 1928, it was an immediate success. It has been called a keen satire of Chinese students "caught between the tide of Western culture and the old Confucian tradition, imagining themselves successors to Confucius in setting up new traditions, while actually they were little more than buffoons." The writer also collaborated with Clement Egerton in his translation of the great Chinese novel *Chin P'ing Mei* ("King Ping Mei"), which was published in England in four volumes under the title *The Golden Lotus.*

In the late twenties Lau Shaw returned to China and his teaching. He taught at the Cheeloo University (formerly Shantung Christian University) at Tsinan and the National Shantung University at Tsingtao, both in the province of Shantung, while continuing his own writing. Since that period he has written several novels, collections of short stories, plays, and humorous sketches. His best-known works are *The Philosophy of Lao Chang, Camel Happy Boy* (the title of *Rickshaw Boy* in China), and the play, *The Problem of Face.* Lin Yutang '40 has said that Lau Shaw enjoys an established reputation in China, as a writer of "genuine, unimpeachable Peking dialect."



LAU SHAW

Like so many of his countrymen, the author moved inland in 1937 in the face of the advancing Japanese, leaving Northern China after the Marco Polo Bridge incident that July. (Marco Polo Bridge or Lukowkiao is a railway junction near Peking where a minor incident was seized upon by the Japanese as a pretext for further aggression in that area.) He arrived in Hankow in 1938 but soon left that doomed city for the Nationalist capital at Chungking. Trips to the northwest during this time provided material for two narrative poems, each of about five thousand lines, descriptive of his journeys to Sian and Lanchow. Then, in collaboration with Soang Chih-ti, he wrote a four-act play concerned with Mohammedan and Chinese unity, *The Nation Above All.* He also wrote stories to be sung in the popular "Big Drum" form. Written in the traditional style, his narrative poems and plays are designed to reach the common people. Professor Chi-Chen Wang of Columbia University believes that the writer was considerably influenced by Western satirical writers, especially Dickens. According to Professor Wang, "In *Lao Niu P'o Ch'e* ("Old Ox Cart"), a volume on his own experience as a writer, he states that it was after reading Dickens' *Nicholas Nickleby* and *Pickwick Papers* that he had the courage to offer his 'Old Chang's Philosophy' to the public."

When the National Anti-Japanese Association of All Chinese Writers was organized in 1938, Lau Shaw became its president and

SHAW, LAU—*Continued*

by repeated re-elections has retained that position. During the war, in addition to pursuing his literary work, he was active in the organization and direction of Chinese writers in the cause of their country. Under his auspices the association sent young writers to homes and the front and to the enemy rear to visit Chinese soldiers and write of their experiences. The resulting stories, sketches, poems, plays, and critical articles were published in the organization's monthly organ, *Resistance War Literature,* edited jointly by Lau Shaw and Mao Tun. At frequent meetings the writers read and discussed new poems and stories, and their discussions dealt with social as well as literary questions. Lau Shaw succeeded in establishing branches of the association in practically all the large cities, activating the literati of those metropolitan centers. However, the growing political control of the press greatly reduced the organization until it became "an almost empty name, with most of the active writers in hiding." In spite of Lau Shaw's effort to keep the publication going, *Resistance War Literature* has appeared only about twice yearly.

The author's devotion to the people is evident in *Rickshaw Boy,* whose hero represents the universal common man. Happy Boy is a young, naive, and inarticulate country boy who comes to the city of Peking and is quickly caught in the web of slum life. The book is the story of his misfortunes—"a series of those fateful perversities that are part of the whole tragic pattern of poverty." The boy learns that "the poor have only one way of deciding any issue that confronts them, and that is on the basis of dollars and cents." Yet, with all his sufferings, he also learns, slowly and vaguely, that "he is not alone in his wretchedness, that he is one of many striving for a better world."

Rickshaw Boy has been called "a devastatingly honest novel which tells more about modern China and its tragic pattern of life than any other book thus far available in America." As a social document, it has been compared with the work of Dickens and the great Russian novelists, Gogol and Dostoevski. Mai-mai Sze found "something Swiftian in the passionate anger of the author's attitude against the system that begets such conditions of unrelieved misery." However, it was pointed out by several critics that the author never uses his characters as "mouth-pieces." "Without a word of propaganda," said Richard Watts, Jr., in the *New Republic,* "it is a most valuable propaganda work for the idealistic theory that all men of good will are brothers." Recognized as a significant contribution to American understanding of modern China, the book, according to Harrison Smith, teaches us about the Chinese people, "their hearts, the comradeship of their multitudinous poor, and the injustice that rules their living and dying." In his review in the New York *Post,* Clip Boutell declared, "*Rickshaw Boy* will make you wonder on what basis peace will be established in the Far East."

General critical opinion commended the vigorous, pungent language of the book and the absence of melodrama in the realistic treatment of the theme. The expert use of the ancient city of Peking as a background was emphasized; Peking, "symbolic of antiquity's massive legacy of stagnation and oppression," is described in all moods and weathers until "it becomes as real as any character." The people of the book were called universal types, "admirably drawn," and especially singled out for praise was the searching analysis of Happy Boy himself. In a dissenting tone, however, William Du Bois '40 wrote that "symbols are poor substitutes for people," and called the book "a worthy try, but a dull novel."

Lau Shaw's novel was translated from the Chinese by Evan King, an American who has lived in China for many years and who some years ago brought another Chinese novel to American readers, *Village in August* by T'ien Chun. Complications arose over the question of royalties on *Rickshaw Boy,* since there are no copyrights on American books in China, and vice versa; King and Lau Shaw are both in China, which further confuses the matter on the issue of taxes. Sweden has already bought publication rights for the book, and it will soon be available to other European readers upon completion of negotiations for the sale of publication rights in France, England, Spain, and Switzerland. Before the book was published in America, some of the author's short stories had appeared in *Contemporary Chinese Stories.* In late 1945 Lau Shaw was working on a novel about wartime China, entitled "Cremation," to be the longest he has ever written.

The Chinese writer is a spectacled man of medium height with brown eyes and "an open, candid gaze." Described by Lin Yutang as an individualist who can not be classified in any school, Lau Shaw is a liberal with no political inclinations, "except for the liberty of his country, and the welfare and freedom of the people." Commenting in an article on the current lack of freedom of expression in his country, he stated, "When I write I feel myself a thief, constantly watching around to see whether there is somebody sneaking behind, watching over what I am writing. How can a writer work when he has to watch over every word he puts down just like a thief watching his every action?" The author has suffered much, and his poor health, caused by undernourishment, hard work, and mental strain, confined him to a hospital for some time in 1944. Living in poverty with his family in Peipei, near Chungking, he refused to accept financial aid, which he felt would compromise his ideals. When a large assemblage paid tribute to him in June 1944 on the occasion of his twentieth anniversary as a writer, he said, "I pledge that while I breathe I won't desert my pen and the honesty of it."

SHAWCROSS, SIR HARTLEY (WILLIAM) Feb. 4, 1902- British Government official; lawyer

Address: b. Ministry of Justice, London; h. Peckhams, Halland, near Uckfield, Sussex, England

Late in the year 1945 international attention was focused on the long-awaited war-crimes trials in Nuremburg, Germany, conducted by the United States, the United Kingdom, the Soviet Union, and France. The chief United Kingdom prosecutor is Sir Hartley Shawcross, K.C., M.P., appointed to the post on August 13, 1945. Shortly before that the relatively young barrister had become Britain's Attorney General, following the Labor Party victory.

Hartley William Shawcross was born on February 4, 1902 to John and Hilda Shawcross. Educated at Dulwich College near London, he also attended the London School of Economics for a brief period. The Englishman then went abroad, spending some time in Geneva, where he studied at the University. Shawcross had become interested in politics at an early age and at sixteen had joined the Labor Party. While he was in Geneva, where the second Socialist International Conference was in session, he assisted in the secretariat and also met many delegates from various countries. Back in England, Shawcross served as election agent for Lewis Silkin during the 1922 General Election when the latter waged an unsuccessful battle for a Conservative district. (Silkin is the present Minister of Town and Country Planning.) As Shawcross gained experience in the Labor movement, he became determined to remain active in its work.

At about this time Shawcross began his legal studies, in which he won first class honors in all examinations, and came out highest in the Bar Final. Called to the Bar at Gray's Inn in 1925, he then practiced law in London for two years. In 1927 he moved from the capital to Liverpool where, until 1934, he was senior law lecturer at Liverpool University. (He received an honorary LL.M. degree from that institution in 1932.) During these years he also practiced law on the Northern Circuit. At a trial at Manchester, Shawcross was junior counsel for the prosecution of a Lancaster murderer. At one time, the barrister led an inquiry into the Gresford Colliery disaster. Conducting the investigation on behalf of the coal owners, he was matched with his friend, Sir Stafford Cripps '40, on the miners' side. It is believed that his conduct of this inquiry considerably aided his career. In 1939 Shawcross became a bencher (one of the senior and governing members who control calling to the bar) of Gray's Inn, and that year "took silk"—received letters patent as a King's Counsel. In 1940 he left his private practice to accept a Government assignment, and a year later, while engaged in important government work as independent chairman of the Kew District Board on coal mining, he was appointed recorder of Salford, in Lancashire. About that time he was also appointed deputy regional commissioner for the South Eastern Region, one of the many zones into which the country had been divided for purposes of defense, and he was a Justice of the Peace for Sussex and assistant chairman of the East Sussex Quarter Sessions. The following year Shawcross was promoted to the post of commissioner of the North Western Region. Charged with the responsibility of the region's entire defense organization, he traveled constantly in his district. In public speeches he repeatedly warned of the probable resumption of large-scale air attacks and urged mutual aid plans among small traders, to become operative during raids, which would benefit storekeepers and the community alike.

Barratts, London

SIR HARTLEY SHAWCROSS

The lawyer's work as regional commissioner was a valuable prelude to his duties as chairman of the Catering Wages Commission, established in July 1943 by the Ministry of Labor and National Service. This Commission was set up to investigate wages and to suggest methods of developing the catering, restaurant, and hotel industry in the postwar period in order to meet the needs of the domestic public and foreign visitors. Shawcross served on the commission until July 1945, at which time he resigned to run for Parliament. However, at the time of his resignation most of the Commission's investigations had been completed and its report was published in September. It has been said that this report, when implemented, will "stabilize wages and conditions throughout the previously unorganized industry, and pave the way for an improved standard of hotel accommodation."

Active for many years in Labor Party work, Shawcross had been asked to stand for election in 1924 but at that time had declined. In July 1945 he was a successful candidate for Parliament in the General Election which swept the Labor Party into power. Shawcross won a majority of about 17,000 over his Conservative opponent, quadrupling the former Labor majority in his constituency. Under Prime Minister Clement R. Attlee's '40 new Labor Government, the new M.P. was appointed Attorney General and shortly thereafter was named chief prosecutor of the war crimes trials for Britain. A few days later, on August 15, Shawcross was knighted. His appointment to these vital

SHAWCROSS, SIR HARTLEY—*Cont.*

offices was welcomed in both legal and nonlegal circles, with the press describing him as one of the country's "most highly-regarded young attorneys." The new Attorney General was in the headline news barely a month later as prosecutor of William Joyce in the treason trial at Old Bailey. Joyce's defense, based on the contention that he was an American citizen, was shattered when the judge accepted the prosecutor's view that "A person who enjoys the effective protection of the British Crown is under duty of allegiance so long as the protection continues." (The defendant had a British passport, issued in 1939). Found guilty by the jury, Joyce was sentenced to be hanged for his broadcasts as "Lord Haw-Haw."

Less than a week after he became chief prosecutor Shawcross flew to Nuremberg with his American, French, and Russian colleagues to inspect the facilities for the trial. The basis for the case against the major war criminals had been established by the four Powers in the formal agreement made in London on August 8, 1945. At that time an historic new code of international law was adopted, defining aggressive warfare as a crime against the world. The agreement established a four-Power international military tribunal and three classifications of war crimes: 1) crimes against peace, involving the planning, preparation, initiation, or waging of aggressive war; 2) war crimes, defined as violations of the laws or customs of war; 3) crimes against humanity. Pursuant to this agreement, the four United Nations representatives prepared a lengthy indictment against the twenty-four major Nazi war criminals, which was released in October, bearing the signatures of Robert H. Jackson ['40] for the United States, Shawcross for the United Kingdom, François de Menthon ['44] for France, and R. A. Rudenko for the Soviet Union. Proceedings began on November 20, 1945. Each person in the courtroom was supplied with earphones which could be tuned to the verbatim proceedings or to any of four translations, and twelve interpreters were also in attendance. Two hundred and fifty newsmen had arranged to cover the trials, and Justice Jackson had announced that there would be no censorship. Sir Hartley's deputy in the prosecution, incidentally, is Sir David Maxwell Fyfe, who was Attorney General in the coalition Government of Winston Churchill ['42].

In his thirty-thousand-word address which opened the British presentation of the case against the twenty Nazi defendants on December 4, 1945, in Nuremberg, Sir Hartley reviewed the international treaties and agreements since the 1899 Hague Convention to prove that the world had outlawed aggressive war. Thus, it is not correct, he declared, to regard punishment for aggressive war as retroactive justice. As to the individual responsibility each defendant bore, he contended: "There comes a point when a man must refuse to answer to his leader if he is also to answer to his own conscience." The British prosecutor was one of the four delegates the House of Commons chose later in December to accompany Prime Minister Attlee to the United Nations General Assembly scheduled to convene early in January 1946.

Both in his legal and political activities Shawcross has expressed his convictions strongly. An ardent Socialist, he made his first political speech as a youth at a public meeting in Birmingham. The Attorney General has expressed himself forcibly against some British prison and punishment methods. In discussing the Penal Reform Bill in 1939, he condemned flogging: "A punishment which makes strong men sick cannot be a good thing," he said. "If flogging is a good thing, why not go back to the thumb-screw, the rack, and other systems of medieval torture?" Known as a hard worker, Shawcross is said to study every brief himself, never passing on his work to juniors.

The Chief Prosecutor is described by Margaret Armour as "a tall, spare, at once dignified and athletic-looking man, with high cheekbones and the healthily weather-tanned complexion of the sportsman." He has dark eyes and hair and a quiet voice. After the death of his first wife, who was Rosita Alberta Shyvers, he married Joan Winifred Mather whom he met while serving as regional commissioner when she was assigned to drive him through the area. They live in a small old country house near Uckfield in Sussex. When he has time for recreation Shawcross likes reading, golfing, or riding. A yachting enthusiast, he belongs to four yacht clubs, Royal Thames, Royal Cornwall, Royal Mersey, and Royal Motor. Sir Hartley is a member also of the Reform Club.

SHELLABARGER, SAMUEL (shĕl′*a*-bär′ gẽr) May 18, 1888- Author; educator

Address: b. c/o The Blakiston Co., 1012 Walnut St., Philadelphia, Pa.; h. 631 E. Town St., Columbus, Ohio

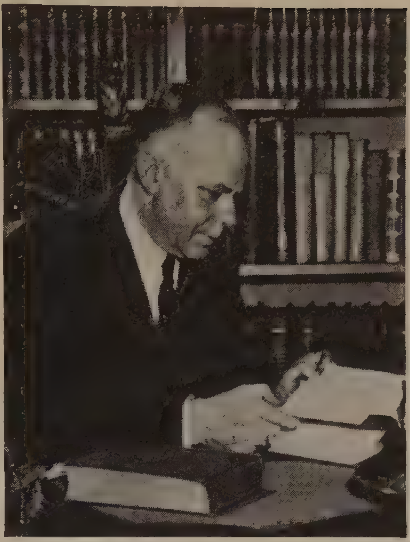
Samuel Shellabarger is the author of one of the 1945 best sellers, *Captain From Castile*, called "one of the most exciting novels of the cloak-and-sword variety to come along in years." No literary novice, Shellabarger has written nine mystery and adventure novels under two pseudonyms, in addition to two scholarly biographies. Combining teaching and writing ability, he has also had a long career as an educator.

A native of Washington, D. C., Samuel Shellabarger was born on May 18, 1888. The son of Robert Rodgers and Sarah Rivera (Wood) Shellabarger, young Samuel was educated in Washington private schools and at the Hill School in Pottstown, Pennsylvania. He entered Princeton University in 1905 when Woodrow Wilson was in the zenith of his career there. Of these decisive years Shellabarger remarks, "Long before then I had decided to make writing either my profession or my avocation, and during the undergraduate years at Princeton I took, I believe, all the various prizes offered in English. In order to secure greater leisure for writing, I decided to enter the academic career rather than to follow the profession of law, which had been my first ambition."

Awarded his B.A. degree in 1909, Shellabarger took a year of graduate work at Princeton and then went to Germany with the intention of taking his doctor's degree at Munich or Leipzig. However, after a year of study at Munich University (1910-11), he returned to America to complete his graduate work at Harvard under such popular men as Professors Kittredge, Neilson, Baker, and Robinson. He received his Ph.D. in 1917. While in Europe on a visit to Sweden in the summer of 1914, he had met Vivan Georgia Lovegrove Borg (the daughter of a Swedish cavalry officer), to whom he was married on June 14, 1915. The Shellabargers have three children: Ingrid Rivera (Mrs. William H. Rea), whose husband served during the war with the Pacific Fleet; Marion, who worked with a Clubmobile unit of the Red Cross in England; and Eric, who was killed in Germany in May 1945.

At the time of his marriage Shellabarger was teaching in the English department of Princeton, a position he had accepted in the autumn of 1914. His teaching career was interrupted by America's entry into the First World War. In 1917 he served as a first lieutenant in the Ordnance Department of the Army. The next year he was transferred to Military Intelligence, promoted to a captaincy, and appointed assistant military attaché at the United States Legation in Stockholm.

When the war ended Shellabarger returned to Princeton as assistant professor of English. After four years of teaching he decided to leave the university to devote more time to writing. In 1923 the Shellabarger family went abroad to live, and for the next five years, the author says, he and his family had their headquarters in Lausanne, Switzerland, although they traveled widely in Italy and France. During this period he prepared the biography of Chevalier Bayard and wrote a novel, *The Black Gale* (1929) and a mystery story *The Door of Death* (1928). Upon his return to America in 1928 *The Chevalier Bayard* was published.



SAMUEL SHELLABARGER

After another two years at Princeton the writer returned to his travels, residing for a time in France and England. Back in America again in 1931, Shellabarger devoted himself to writing for several years. In 1935 his biography of Lord Chesterfield was published. Under the pen name of John Esteven (which he had used for *The Door of Death*), he next wrote mysteries of the "shudders and chills" variety. They bore the suggestive titles: *Voodoo* (1930), *By Night at Dinsmore* (1935), *While Murder Waits* (1937), *Graveyard Watch* (1938), and *Assurance Double Sure* (1939). Using the name of Peter Loring, Shellabarger wrote *Grief Before Night* (1938) and *Miss Rolling Stone* (1939). The writer has also contributed fiction to magazines, including *McCall's* and *Cosmopolitan.*

Shellabarger returned to the educational field when, in 1938, he accepted the position of headmaster at the Columbus School for Girls in Ohio's capital. The educator now declares that he has found in secondary school work "a much keener appeal and a much more varied scope than university work provided." His students approve highly of their headmaster's 1945 novel, *Captain From Castile*, agreeing with the American reading public, which kept the book at the top of best seller lists for weeks after its publication in January.

A picaresque novel of the early sixteenth century Spanish conquest of Mexico, the book was chosen by the Literary Guild for distribution among its three hundred and fifty thousand members. Before publication, *Captain From Castile* was purchased for a motion picture in November 1944 by Twentieth Century-Fox for one hundred thousand dollars. The

SHELLABARGER, SAMUEL—*Continued*

film will be produced in 1946, with Tyrone Power in the role of the romantic hero. It is estimated that cinema production of this swashbuckling saga will cost three million dollars. Most critics agreed that the romantic tale is a "natural" for films—its action and glamour are "tailored" for a grandiose Technicolor setting. The book was in its twelfth printing in March, and English, Norwegian, Swedish, Danish, Dutch, French, Spanish, German, and Portuguese rights to the book have been sold.

Shellabarger has written, in the Dumas tradition, a colorful melodrama of epic proportions. The story concerns the handsome young Spanish nobleman Pedro de Vargas, whom Sterling North '43 described as "the Three Musketeers and Rudolph Valentino rolled into one sixteenth century package." He joins Cortes in his Mexican adventures and is thus involved in the violent and varied fortunes of the Spaniards in the New World. It is a story brimming with romance and action, set in the period of the Spanish Inquisition. From the heart of Spain to the Mexico of the Aztecs, Shellabarger's bright tapestry of the dramatic Renaissance is considered to be skillfully woven. (The author's historical accuracy was commented upon by the critics.)

Time Magazine considered *Captain From Castile* "among the best popular fictional accounts of the conquistadors that has appeared," a book that is not slowed down by "philosophical pauses, such as clogged the pell-mell action of [Hervey Allen's] *Anthony Adverse*." The work was also commended by other critics, including Orville Prescott, who wrote: "As an example of sheer yarn spinning, of keeping a brew of exciting action constantly at the boiling point, *Captain From Castile* is excellent." Harrison Smith of the *Saturday Review of Literature* stated: "His narrative style is lively and simple, his characters, although they are necessarily stereotyped, are not period costumes with sawdust insides, but something resembling flesh and blood." On the other hand, Prescott declared, "The characterization throughout is rudimentary and superficial, which are faults of its kind." William Du Bois '40 agreed with him that the characters are "a bit on the wooden side." However, most reviewers liked the vivid pageantry of this period romance. To hold the reader spellbound and convinced, said Robert Root, faculty dean of Princeton, "called not only for the art of the story-teller, but also for the reconstructive imagination of the historical scholar. . . .But the antiquarian learning never obtrudes itself on the reader. . . .The scholar and the story-teller are perfectly fused." The book is "a fine literary achievement," declared Root.

A fluent linguist, Shellabarger speaks and reads French, German, Swedish, Italian, Dutch, and Spanish; he is also a Greek and Latin scholar. The collection of the classics of all these languages has been his lifetime hobby. Discussing the job of a writer, Shellabarger once said: "I don't feel a writer should just write, he should be out in the world." The author has also expressed his belief that the historical novelist "could often do better work from contemporary chronicles than through seeing a place at the present time." For this reason Shellabarger wishes he had not lived so long in Italy, since he is now working on a novel dealing with Ferrara and Rome in the year 1500.

The professor-turned-novelist is a cheerful white-haired, ruddy-faced man. Fencing, riding, and tennis are his favorite sports. He is a member of Phi Beta Kappa, the Tower Club at Princeton, and Columbus' Crichton and Review clubs. The world traveler has especially enjoyed hunting and camping in the Canadian Rockies, visiting ranching friends in Arizona and the borders of Mexico, and climbing in the Alps and Norway. Shellabarger is interested in the historical and social backgrounds of the great European capitals, and his favorite cities are Stockholm, Munich, Paris, and Rome. Significantly, the author of a book laid in the Spanish scene says, "One of my favorite ranges of mountains is the Pyrenees, with their gateways into the distinctively different Spanish world."

SHREVE, R(ICHMOND) H(AROLD) (shrēv) June 25, 1877- Architect

Address: b. Shreve, Lamb and Harmon, Architects, 11 E. 44th St., New York City; h. 50 Euclid Ave., Hastings-on-Hudson, N.Y.

The senior member of the firm of Shreve, Lamb and Harmon, the architects who designed New York's Empire State Building, is R. H. Shreve. Long a well known figure in the architectural world, Shreve concentrates on the operational and administrative problems of building, his associates assuming responsibility for the design.

Richmond Harold Shreve was born in Cornwallis, Canada, on June 25, 1877, and went to the United States with his parents, Richmond and Mary C. P. (Hocken) Shreve, when he was eight years old. The family made their home in Albany, New York, where the youth attended Albany High School and then went to work to earn the money for his college tuition. The job he obtained was in the office of the New York State architect in Albany, for whom he was hired as an office boy; before he entered Cornell University he had worked himself up to the position of junior draftsman.

After receiving his degree of Bachelor of Architecture in 1902, Shreve was able to satisfy his desire to do graduate work in structural design and special engineering problems by taking a post on the faculty of the College of Architecture at Cornell. While teaching and studying at the university he became associated with the firm of Carrere and Hastings, prominent New York architects, who at that time had a contract for a million-dollar building project on the campus. Shreve was given the job of superintendent and inspector of construction, and when the buildings were completed in 1906 he accepted the offer of a position in the firm's New York office. (He was naturalized that year.) In 1920 the firm became Carrere, Hastings, Shreve and Lamb.

Four years later the two junior partners, Shreve and William Frederick Lamb, branched out on their own, and in 1929 they were joined by Arthur Loomis Harmon, becoming the present organization of Shreve, Lamb and Harmon.

In its field, Shreve, Lamb, and Harmon are noted for their ability to function as a well-integrated team. When commissioned to do a building two or all three of the executives meet the client in a conference. Shreve is always present at these conferences, in which the needs and wishes of the client are discussed; the responsibility for the actual design is taken by either Lamb or Harmon. When the design is ready for approval Shreve criticizes it from the client's point of view, emphasizing utility and practicability rather than the esthetic qualities of the building. In the actual construction Shreve is particularly concerned with planning operations, in which his special talent is recognized among his colleagues. His main task in the office is now business administration, but he still cherishes a bronze medal he won for an original design, and he likes to remember that one of his life drawings hung for many years on the wall of an instructor's office at Cornell.

The firm of Shreve, Lamb and Harmon, Architects, has designed several New York City skyscrapers, the most famous of which is the 102-storied Empire State Building. (Since 1931, when the tallest building in the world was completed, six million people have visited the observation tower, more than four hundred thousand each year.) For its work, the firm has been awarded the Gold Medal of the Architectural League of New York and the Gold Medal of the Fifth Avenue Association, both given in 1931. Among the firm's other designs in New York are 500 Fifth Avenue, an office building of fifty-eight stories, the forty-storied Lefcourt Building, and the block-sized General Motors Building, which is used for offices and showrooms.

The firm which Shreve heads has not confined its work to New York City, however, having designed buildings such as the R. J. Reynolds Tobacco Company plant in Winston-Salem, North Carolina, and the Acacia Mutual Life Insurance Company in Washington, D.C. Nor has it limited its commissions to offices—buildings for Hunter College in New York City being only a few of its many designs for educational institutions. The firm was responsible for several buildings at Connecticut College for Women, Williams College, Wesleyan University, and for the buildings which house the School of Engineering at Shreve's alma mater, Cornell University.

During the Second World War the firm was commissioned by the Government to handle several wartime projects. It designed the Outlying Defense Base in Newfoundland, in collaboration with the engineering company of Fay, Spofford and Thorndyke, and the United States Coast Guard Academy Building at New London, Connecticut, which was designed to serve as a combination hospital, infirmary, and classroom building. It planned additional housing at Mitchel Field, the Army Air Force base on Long Island, and designed the Naval Training Station at Sampson, New York, where thirty thousand trainees and staff members were accommodated at one time.

R. H. SHREVE

Shreve's firm has been the recipient of many awards in addition to the medals for the Empire State Building. For 1930 it was awarded the Fifth Avenue Association's Gold Medal by a jury of architects for the L. P. Hollander Company Building, and two years later it received the Medal of Honor of the New York Chapter of the American Institute of Architects for "distinguished work of high professional standing." In November 1937, at the Paris Exposition, the Grand Prix in Architecture was given to Shreve, Lamb and Harmon. The company was awarded the Gold Medal of the Fifth Avenue Association again in 1939 for the Lily Daché building in New York, on which it collaborated with Georges Letelie of Paris. The design was judged the best one made for a Fifth Avenue building in the years 1932 through 1938.

Each year, upon the recommendation of the faculty of Cornell University's School of Architecture, an outstanding graduate of the school is given an apprenticeship with Shreve, Lamb and Harmon, which assures the winner of a year of varied experience. At the end of the year the graduate is offered a permanent position on the staff if his work has been satisfactory.

Although his firm specializes in office and other commercial buildings, Shreve himself has a deep interest in housing problems, and since 1934 has been director of the Slum Clearance Commission of New York City. He was the chief architect of the Williamsburg Housing Project in Brooklyn, which was completed in 1938 after three years of work by a group of associated architects. In 1939 he held a similar position with the Vladeck Houses, a housing project in Manhattan which was also planned by a group of architects. During the years 1938 and 1941 Shreve was the chairman of the Board of design and chief architect of Parkchester, a low-rent residential

SHREVE, R. H.—*Continued*
community built by the Metropolitan Life Insurance Company in the Bronx, New York.

Shreve is an active member of the Real Estate Board of New York, having served on the Board of Governors from 1930 to 1932, from 1935 until 1937, and from 1940 to 1942. He is a member of the New York Building Congress, of which he was elected president in 1927, and he remained in office until 1930, for three consecutive terms. In 1939 he became a member of the Board of Design for the New York World's Fair, for which Shreve, Lamb and Harmon designed the Johns-Manville building. He is a member of the Advisory Board of Architects of Goucher College and of the Advisory Council of Architects of Cornell University. A member of the American Institute of Architects, Shreve has not only served as the New York chapter president, but as president of the national organization for two terms, from 1941 until 1943. He belongs to the Cornell Club, of which he was president from 1924 until 1927, and to the Union League Club in New York. He is an honorary Corresponding Member of the Royal Institute of British Architects.

When interviewed after his election to the presidency of the A.I.A., Shreve gave reporters his opinions of the changes occurring in his profession. He thinks that the opportunity which the architect of the twenties had to earn money through the patronage of the rich will never return, that government, community, and business have replaced the rich art patron as the architect's employer. In the future, Shreve continued, the designer will build for utility and economy rather than for "pride, display, and self-gratification. . . .We shall undoubtedly see outdated, inefficient, uneconomical structures torn down to make way for new and efficient and economical buildings, in tune with the time and meeting our constantly growing needs." Shreve feels that, rather than suppressing originality, this type of architecture will require even more ingenuity and skill than has been required in the past.

The architect was married in 1906 to Ruth Bentley. They have three sons, Richmond Bentley, Robert Wilton, and Thomas Charles, none of whom has turned to architecture as a profession. Shreve spends most of his vacations fishing in the northern part of the United States. He is very methodical, planning even his fishing trips as carefully as he would the operations chart of a building.

SIMPSON, WILLIAM H(OOD) May 19, 1888- United States Army officer
Address: b. c/o War Department, Washington, D. C.

Like several other top-ranking United States Army officers, Lieutenant General William H. Simpson, who led the Ninth Army to victory in Europe in the Second World War, comes from a family of Civil War rebels. The son of a Confederate veteran, Edward James Simpson, and of the former Elizabeth Amelia Hood, William Hood Simpson was born May 19, 1888, in the town of Weatherford, Texas. "As soon as he could walk," it is said, "he was toddling around in parts of his father's old Tennessee Cavalry uniform." Young Bill attended Weatherford schools and reportedly starred on the high school football team. At fifteen he entered the Hughey and Turner Training School, and at seventeen he traveled from Aledo, Texas, to West Point, New York, where he had won appointment as a Military Academy cadet. Robert H. Shoemaker writes that Simpson had a hard time keeping up with the work because his scholastic background was inadequate; at one time he "conveniently became sick and spent his time in the hospital studying" for examinations. The Texan played football at the Academy until a knee injury put him out of the game. At his graduation in June 1909 he was the youngest man in his class, and the lowest in grades. Since then, however, Shoemaker adds, he has been an honor student at each of the Army Schools in which he enrolled.

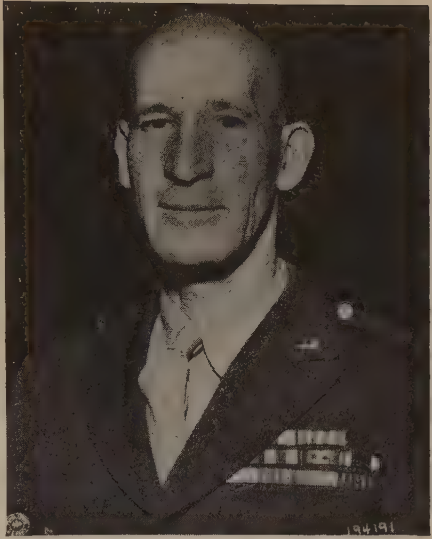
Commissioned a second lieutenant, Simpson was sent to Fort Lincoln, North Dakota, to join the Sixth Infantry Regiment. At the end of that year his regiment left for the Philippines, where he served until July 1912, at which time he was assigned to the Presidio of San Francisco. Two years later "Texas Bill" Simpson was back in Texas, on border patrol duty at El Paso. After duty at the Panama Pacific International Exposition at San Francisco from February to December 1915, the Lieutenant returned to Texas and rejoined his regiment for the more serious business of the punitive expedition into Mexico, which General Pershing led against the bandits of Pancho Villa in 1916.

Back in Texas with a promotion to first lieutenant, Simpson was chosen by General George Bell, Jr., as his aide, and accompanied the General on a tour of observation with the British and French armies from February to December 1917. Afterward the twenty-nine-year-old captain (promoted in May) was made assistant chief of staff of the Thirty-third Division, which embarked for France in May 1918. Arriving in Europe, Simpson was sent to the AEF's Army General Staff College; later he rejoined his unit, on which duty he won the Distinguished Service Medal for his staff services, and the Silver Star for his personal gallantry. The French Government honored him also with the Croix de Guerre and the Legion of Honor. Six days before the Armistice, Major Simpson was given a second temporary promotion, to lieutenant colonel. At this time he was division chief of staff, which meant that he was responsible for all the commanding general's routine work and for the operation of the four staff sections—personnel administration, intelligence, operations and training, and supply. As chief of staff, in short, it was Simpson's duty to know everything about everything pertaining to the fifteen thousand men of the division, and to the enemy forces as well.

Returning to the United States in May 1919 Colonel Simpson became chief of staff for the Sixth Division at Camp Grant, Illinois. On June 30, 1920, he reverted to his permanent rank of captain, and the following day was promoted to major. At the beginning of 1921 he was assigned to duty in the Office of the Chief of Infantry. That December the thirty-three-year-old major was married to Jean Ruth (Webber) Krakauer, a London-born widow who lived in El Paso with her two children: Syble Kight (Mrs. Robert H. Stevenson) and Ralph Krakauer. "When we were first married," Ruth Simpson says of her husband, "he had a difficult time speaking in public. So we set up a private speech class in our home in Washington." Later Simpson taught the first War Department classes in public speaking. Until 1923, it is said, Simpson was one of the Army's best polo players. But in that year, when he was captain of the Fort Benning team, his polo days were ended when he fractured his hip on the field.

After two years in Washington, he was sent to the Infantry School at Fort Benning, Georgia, and then to the Command and General Staff School at Fort Leavenworth, Kansas. Completing the course at the latter on June 19, 1925, he was described officially as a "distinguished graduate." Then the Texan was given command of the Third Battalion of the Twelfth Infantry Regiment, first at Fort Meade and later at Fort Washington, Maryland. Reportedly, the future general distinguished himself in maneuvers; and in August 1927 he was enrolled for the highest United States military training, at the Army War College. While there the Major headed a committee on decorations. When the present General of the Army George C. Marshall '40 learned that Simpson's idea was to "take a barrel of decorations and hand them out right after a battle," he agreed heartily. A liberal system of awards, much joked about by the less liberal British Army, has prevailed ever since Marshall became Chief of Staff.

Graduated in 1928, Simpson became a member of the War Department General Staff in Washington, where he served until 1932. Next he taught military science and tactics at Pomona College, California, returning to the Army War College as an instructor in 1936. (Advanced to lieutenant colonel in October 1934, he was made a colonel in September 1938.) He remained at the War College until 1940. In August of that year he was given command of the Ninth Infantry Regiment, headquarters at Fort Sam Houston, Texas. On October 1, 1940, Colonel Simpson, who is said to have acquired an expert knowledge of tanks and field artillery, was promoted to brigadier general (temporary) and named assistant division commander of the Second Division, at the same station. Seven months later he was assigned to command the replacement center at Camp Wolters, Texas, and in September 1941 he was advanced to major general (temporary). On October 14, 1941, he became commanding general of the Thirty-fifth Infantry Division at Camp Robinson, Arkansas, and a few days after the United States entered the Second World War took that division to California. In May 1942 he was transferred to Fort Jackson, South Carolina, and assigned as commanding general of the Thirtieth Infantry, the Old Hickory Division.



U. S. Army Signal Corps

LT. GEN. WILLIAM H. SIMPSON

When the Twelfth Army Corps (a corps is two or more divisions strong) was activated at Fort Jackson, South Carolina, in September 1942, Simpson was designated as commanding general. In October 1943, with the rank of lieutenant general (temporary), he was appointed commanding general of the Fourth Army at San José, California. This army, until recently part of the Western Defense Command, had been separated from it, and it was Simpson's task to shape it into a combat unit. As leader of one of the few full United States armies—at least two corps—he reorganized the armored divisions and increased the number of infantrymen in them "so they can play a greater part in work with tanks." "With victory assured," he said in April 1944, "earlier victory is the issue." The General called for "more spiritual preparation as well as mental and physical preparation for the ordeal of battle," and quoted with approval British General Sir Harold Alexander's '42 dictum that the Allied soldiers should be indoctrinated, not with hatred, but with "the willingness to give their lives for a way of life they know to be superior."

In May 1944 Simpson arrived in England in command of the United States Eighth Army. General Dwight D. Eisenhower '42 changed its designation to the Ninth Army two days later, to avoid confusion with the famous British

SIMPSON, WILLIAM H.—*Continued*

Eighth Army; and thereafter all United States forces in the European theater were given odd numbers. Like other armies, the Ninth includes representatives of other Allied nations, members of the Royal (British) Armored Corps having served in it with particular distinction. The original plans were to keep it in England until October—meanwhile shifting its component units around so as to confuse the enemy Intelligence; but things were speeded up after the success of the Normandy breakthrough, and on September 13, 1944, SHAEF announced that the United States Ninth Army had gone into action on the western front in France. It was the fourth American army there, the others being the First, under Lieutenant General Courtney H. Hodges '43, the Third, and the Seventh, commanded by Simpson's old friends Lieutenant General George S. Patton '43 and Major General Alexander M. Patch '43, respectively. (Mark Clark's '42 Fifth was still fighting in Italy.) Also fighting the Germans on French soil were the British Second Army under Sir Miles C. Dempsey '44 and the Canadian First under Lieutenant General H. D. G. Crerar '44. The Ninth's location was not announced, nor was it made clear whether that army came under Lieutenant General Omar N. Bradley's '43 Twelfth Army Group, Field Marshal Sir Bernard L. Montgomery's '42 Twenty-first Army Group, or some other, as yet unknown. (Actually, the Ninth was under Bradley.) For this reason newspaper writers referred to it as "the mystery army."

Something of a mystery general too, Simpson was "known to the Nazis only through his reputation as a genius at military organization," the United Press reported, "and as the onetime ace trouble shooter for the late Lieutenant General Lesley J. McNair '42, architect of American ground forces . . . a firm advocate of thoroughgoing infantry tactics." His army "took over the job of cleaning up Brittany" on the fifteenth of September, accepted the surrender of some twenty thousand fully equipped German troops on the sixteenth, and besieged the port of Brest, which fell on the twentieth.

After this successful debut Simpson and his army dropped out of the news swiftly and completely; apparently the German Intelligence was as much in the dark as the American public as to its whereabouts. To achieve this secrecy the Ninth "leap-frogged almost eight hundred miles across the paths of other armies," through Luxembourg, France, Belgium, and Holland for two months, until it entered Germany. In October it swung into line between the British Second and American First Armies. Meanwhile, Simpson "ordered up a minimum of forty complete plans" for the forthcoming operations, the drive against the steel and concrete Westwall which began November 16, just north of Aachen, otherwise Aix-la-Chapelle. Simpson was constantly with his troops in the field, personally inspecting every freezing, muddy, snowed-on sector of his command and visiting nearly every unit by plane or jeep.

Ninth Army progress was slow and full of "desolation, difficulty, danger, and discomfort." The Germans, fighting in defense of their homeland, were strongly entrenched and had to be blasted from house after house. They employed several V-weapons ("V" for vengeance) against Simpson's men, including flying bombs, robot tanks, and rockets. Dictating the painful character of the advance was the weather, a combination of snow with almost unceasing rain which turned the flat open Aachen region into one huge quagmire. Air coordination was sharply reduced; tanks and other heavy tracked vehicles were useless in the thick mud through which the doughboys waded, sometimes up to their ankles, sometimes to their knees, sometimes to their hips. This battle of the Cologne plain, fought by the First and Ninth armies, was described by the German radio as "the most terrible and most ferocious in the history of all wars." Wrote the New York *Times*: "The whole front, four hundred and fifty miles from Switzerland to the Netherlands, was ablaze, but on the approaches to the industrial Ruhr and Saar [valleys] the fighting was of unprecedented heat. Enormous pressure against utmost resistance was generating white-hot war of attrition, eating into the strength of both sides."

Grimly the Ninth pushed on through thickly-sown mine fields. Gains were counted in yards rather than in miles, and the Germans were reported to have 30 to 40 per cent of their forces, including most of their best troops, holding the Ninth's 15 per cent of the entire Allied western front. On February 23, 1945, the First and Ninth armies surged across the flooded Roer River, the last natural barrier before the Rhine, and crossed the Cologne plain with such speed as to reach the Rhine sixty hours later. On March 24 they crossed the Rhine and completed the encirclement of the Ruhr. So many thousands of prisoners surrendered that they constituted a serious inconvenience. Members of the Volkssturm (People's Army) were usually sent home and told to behave themselves. More of a problem were the many thousands of displaced persons—liberated slave laborers and concentration camp victims—clogging the roads; Simpson received constant appeals for help from his combat units in caring for these usually mistreated and needy Allied nationals as well as people who had been persecuted by the Germans. Little preparation had been made for them. The General had to designate increasingly large combat units for the purpose. After the surrender, his Sixth Corps set four infantry divisions to the task of collecting and caring for the displaced persons, with the aid of UNRRA teams.

Simpson's men were apparently in a position to take Berlin, but Supreme Headquarters halted them on the Elbe. After the surrender photographers did not fail to catch the "superb spectacle" of General Simpson's dignified and immaculate figure being tossed in the air three times, as a mark of honor, by a group of Red Army entertainers whose performance at a victory banquet he had praised. Another honor accorded the American general was his investiture by King George '42 as a Knight Commander of the Order of the British Empire.

June 24 found Simpson one of a group of twelve generals who flew back from the ETO to the United States. Less than a month later the fifty-eight-year-old general arrived in Chungking. With the commander of American forces in China, General Albert C. Wedemeyer '45, he made a five-thousand-mile tour of

Chinese provinces by plane and jeep in ten days. In October of that year, two months after the Japanese surrender ended the Second World War, "Texas Bill" Simpson assumed command of the Second Army at Memphis, while his wartime Ninth Army was being disbanded.

The Doughboy General, as Simpson is sometimes called, is lean and hard—some say cadaverous—sharp-featured, soft-spoken, and completely bald. A close student of military tactics, he is reportedly one of the best raconteurs in the Army, and likes to relax after duty by taking a long walk or watching a movie at his headquarters. He seldom raises his voice even when angry; Hanson Baldwin '42 calls him "the sort of fellow who you feel instinctively would make a good friend." Others sum him up as "a Texas cowboy who got into the Army and never got out." He is a Mason, but not a very active one. An excellent horseman, he is fond also of golf, and up to 1943, Shoemaker writes, he used to take a twenty-five-mile hike under full pack every Saturday. "I doubt if there's a military history or biography he hasn't read," says his wife. The six-foot-one-inch soldier is noted for his smartness of dress. Gault MacGowan '45, interviewing him on the Cologne plain, at a time when the General had not had more than four hours of nightly rest since the opening of an offensive, gave this description: "Smooth-shaven, spotlessly clean, with his high shoes brilliantly polished and his chest dazzling with resplendent rows of ribbons, he might just have stepped off the West Point parade grounds." Another correspondent, the dramatic critic Howard Barnes, remarked, "Simpson is no actor, but he has the dynamic power of a great man in his field who relies on underacting to make his point."

SLIM, SIR WILLIAM JOSEPH Aug. 6, 1891- British Army officer

Address: b. c/o War Office, London

The British Fourteenth Army, after three extremely hard years of large-scale guerrilla fighting, captured the Burmese port of Rangoon on May 3, 1945, thus bringing to a close the most forgotten of all "forgotten wars," the Burma campaign of the Second World War. At the head of this army, composed of British, Indian, and West African troops, was Lieutenant General Sir William Joseph Slim, who led them through one thousand miles of Japanese-infested mountain and jungle, from Imphal to Rangoon. After the surrender of Japan the General was appointed commander of Allied land forces in Southeast Asia and at the end of the year commandant of the newly reopened Imperial Defence College in London.

British Official Photo.
LT. GEN. SIR WILLIAM JOSEPH SLIM

Born on August 6, 1891, William Joseph Slim is a veteran of two wars. He received his schooling at King Edward's Grammar School in Birmingham, and by his twenty-third year had tried his hand at clerking, teaching, and as a foreman of a testing gang in an engineering plant, but when the First World War began he found that he was best suited to be a soldier. Commissioned on August 22, 1914, in the Royal Warwickshire Regiment, he first served as a junior territorial N.C.O. He was soon sent to Mesopotamia; later he was shifted to "bloody" Gallipoli, where he suffered his first wound. At this point the young officer's military career might have ended. He was discharged from an English hospital as permanently unfit for service, but, by what he calls "undivulged means," he got back into the Army and fought in France and Belgium. Then, returning to Mesopotamia, he took part in the capture of Bagdad, was again wounded, and was awarded the Military Cross.

Between wars Bill Slim served with the famous Sixth Ghurka Rifles. He was attached to the General Staff of the Indian Army from 1917 to 1920, and again from 1929 to 1933. He was also graduated from and later instructed at the Staff College, and he completed a course at the Imperial Defence College. In 1919 he was promoted to captain, and eleven years later to brevet major. Before the Second World War began, Slim, in June 1939, was appointed commandant of the Senior Officers' School at Belgaum, in the province of Bombay.

In August 1940 General Slim led the Tenth Indian Infantry Brigade of the Fifth Indian Division into the Anglo-Egyptian Sudan where his men aided in the recapture of Gallabat on the Abyssinian border. By the following January he was fighting in Eritrea on the Red Sea. While on a reconnaissance in the vicinity his party was attacked from the air, and Slim was severely wounded. This injury prevented him from taking further part in the campaign that secured the Red Sea as a channel of communication for the Allies. However, he was returned to duty in March of the same year, and took up a staff post in Iraq. Shortly afterward

SLIM, SIR WILLIAM JOSEPH—*Cont.*

he assumed command of the Tenth Indian Division, marching these troops across Iraq into Syria, where they assisted in the Allied campaign which in June of that year successfully ended the resistance fomented by the Vichy Government, thereby preventing the acquisition of airports by the Germans. Slim next took part in the Anglo-Russian operations in Iran, assaulting the powerful enemy positions at Kermanshah, then driving north to Aveh for the first juncture of British Imperial troops with their new Russian allies. One of the results of these operations was to make possible the southern supply route to Russia. For his part in the campaign, General Slim was awarded the Distinguished Service Order.

By this time (December 1941) Japan had entered the war and was threatening the British forces in Burma. Slim was transferred to this theater in March 1942 and given command of the newly formed First Burma Corps, under the command of Field Marshal Sir Harold L. Alexander '42. The British, being greatly outnumbered by the Japanese, were forced to withdraw from Burma to the Indian frontier. By June, however, British forces in this area had been strengthened, and Slim took command of the Fifteenth Indian Corps in India. In December a limited operation was undertaken by this corps in the Arakan district of Burma as a diversionary move to offset the Japanese thrust toward the American transport base at Kunming, China. In recognition of his services in this campaign, Slim was made a Commander of the British Empire.

In August 1943 Admiral Lord Louis Mountbatten '42 took the over-all command in the southeast Asia sector, and Allied forces soon reached great strength. The newly formed Fourteenth British Army, composed of the Fifteenth Army Corps in Arakan, and the Fourth Corps in Assam, was put under the command of General Slim in October of that year. Despite 237,000 cases of illness in the first six months of 1944, the Fourteenth was maintained at a strength of more than a quarter of a million men. Its divisions were formed from men of the United Kingdom, East and West Africa, India, and Burma.

No large-scale operation was started, however, because the Allied supplies and landing craft were channeled into the European invasion. When spring came the Japanese struck, moving toward the vital Ledo Road. By June Slim's men had flung them back, by August they had cleared the Nipponese from India—a victory for which their general was made a Knight Commander of the Bath. Slim's forces went on the offensive, racing against the monsoons which turn the country into a quagmire. After two months of attack and counterattacks, in weather stifling by day and bitter cold by night, important Mandalay was captured in March, 1945. Rangoon fell in early May. All supplies used in the year-long offensive were dropped by parachute, totaling some six hundred thousand tons. Burma had been secured for the Allies by Slim's flood warfare, but not conquered: "one of the dirtiest clean-up jobs of the Pacific war remained to be accomplished," and "the ceaseless, drenching monsoon rains, the knee-deep muck, and the menace of tropical disease contributed to the particularly ugly and difficult character of the fighting." This continued until the end of the war with Japan, despite the annihilation of the Japanese Imperial Twenty-Eighth Army which was announced at the end of July.

After the surrender of Japan General Slim was appointed commander of Allied land forces in Southeast Asia. Describing the situation in Indo-China between released Frenchmen and native Annamites as "tense," Sir William said, "We have no political aims whatever except for dealing with the danger arising." With the outbreak of hostilities in Java in September Slim was sent to Batavia to help the Dutch quell the Indonesian nationalist movement in Java. In December the British Government decided to reopen the Imperial Defence College in London, and General Sir William Slim was called back to England to head it as commandant. That month he was decorated with the American Legion of Merit.

A sturdy, strong-jawed man who looks more like an English farmer than a general, Slim is shy of publicity. Reading is his favorite diversion, and he has written articles under a pen name. During the war Lady Slim worked as an assistant in hospitals in Shillong in Assam; their son in 1945 was studying at Dehra Dun Military College in India, and their daughter was attending school.

SMITH, SIR BEN 1879- British Government official; labor leader

Address: b. Food Ministry, London; Transport House, Smith Square, London

The important post of the Minister of Food in the Attlee '40 Labor Government of the United Kingdom was given in July 1945 to one of the most colorful Members of Parliament, Sir Ben Smith. A former sailor, merchant seaman, cab driver, dockyard worker, and union organizer, "Big Ben" Smith had been knighted in June for his work during the wartime coalition Government of Winston Churchill '42.

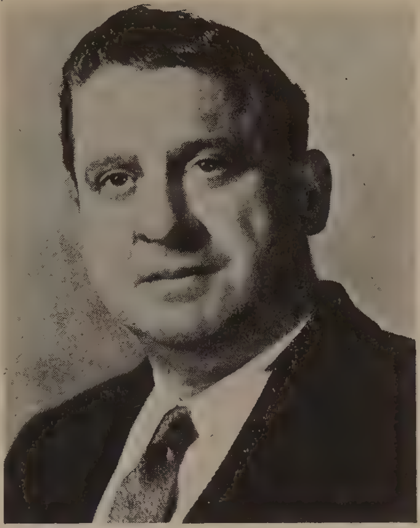
Born in 1879 to Mr. and Mrs. Richard Smith, the future M.P. was named simply Ben. Like many boys of working-class families, he left home at an early age, in his case eleven, to enter the Royal Navy. While serving as ship's boy on the training ship H.M.S. *Warspite* for fifteen shillings (less than four dollars) a month, the tall young boy was for a year middle-weight champion of the Royal Navy lower-deck. Soon afterward he turned to the Merchant Navy, becoming cook on a topsail schooner, in the days when, as he recalls, "We had to float our biscuits on top of the hot tea so as to frighten off the weevils."

At twenty, Smith was married to Mildred Ellen Edison of Peckham and left the sea. (The Smiths now have two sons.) "Necessity rather than choice" forced him to become a cabby. In 1906 Smith gave up his horse for an automobile, which was one of the first taxis in London. "In those days," says George Darling of the BBC, "the taxi-men were not only exploited by hard hire-purchase [installment buying] terms and low fares, but they made the exploitation worse by cutting each other's livelihood. Altogether the conditions were such an offense to Ben Smith's practical common sense that he started organizing his fellow cabbies to cooperate for standard fares and agreements and the promise of a decent living." He became an official of the new union, and in 1920, when it was merged with several others to form the huge Transport and General Workers' Union, he continued as an organizer.

To quote Darling again, "Ben Smith worked among the dock workers on London's riverside and the men who run London's ubiquitous bus services, for dockers and road transport operators are the backbone of the union. He did more organizing than negotiating. His job was to make the union strong and make the members aware of its strength. He suited London's transport workers.

"He looked like a union organizer, tough, bluff, and strong, but the men he worked with learned also to respect his mind. He has a surprising grasp of industrial technique and organization and like most of Britain's trade union officials he is keenly interested in local government. The dockers elected him to the Bermondsey Borough Council. Bermondsey is a poor district on the south side of the Thames, stretching from London Bridge down below the network of the Surrey Commercial Docks. Waterside workers, mechanics, railwaymen, workers in London's markets, warehouses, and back street factories live there, and Ben Smith has served them well. He is still an alderman of the borough."

In 1923 Alderman Smith was elected to Parliament from the Rotherhithe Division of Bermondsey, and continued to serve there for eight years. In 1925 he was chosen Labor Party whip, thus making him responsible for party discipline and attendance; the party whip is also responsible, usually, for obtaining pairs for members who cannot be present when a vote is taken. In 1924 he led a procession of hired vehicles through Hyde Park, which had been reserved for private carriages for three hundred years. Later he became general manager of his union, which has beei described as probably the largest in the world. In the Ramsay MacDonald Labor Government of 1929-31, the unionist was Treasurer of the Royal Household—a post in which he, like two fellow Laborites, wore a resplendent uniform, complete with ceremonial sword and wand of office. King George V allowed Smith and the others to keep the wands for souvenirs when the Government resigned, and also presented them with photographs of himself and Queen Mary. During a vacation, incidentally, the Smiths toured Egypt and Palestine, in company with another Labor M.P., traveling both ways by tanker.



SIR BEN SMITH

Smith lost his seat in the Conservative landslide of 1931, after Prime Minister MacDonald left his party. While out of office Smith contested the Clay Cross, Derbyshire, by-election, but without success. In 1935 he won back his seat for Rotherhithe, defeating Nora Runge. Back in Parliament, he entered vigorously into debate on his subjects of shipping, railways, and road haulage. (Smith is vice-chairman for roads of the Safety First Association, an executive member of the Roads Improvement Association, a member of the London Traffic Advisory Committee, and an associate of the Institute of Transport.) In 1937 the Laborite was in the news as he led an unsuccessful deputation of protest to the Home Secretary, Sir Samuel Hoare '40, asking him not to permit the British Fascists to march through South London. Later that year the M.P. charged that he had been enrolled as a constable of West Hartlepool, without his consent, in an attempt to curb his trade union activities, a charge denied by the mayor and town council.

When the Second World War broke out Smith, then sixty, took an active part in recruiting drives. After Lord Beaverbrook '40 became Minister of Aircraft Production in the all-party War Cabinet headed by Winston Churchill '42, he "looked round for the toughest trade union leader he could find to . . . smooth out all the appalling labor difficulties," and chose Ben Smith. In July 1940, when Smith entered on his unpaid duties as honorary labor adviser to the Aircraft Ministry, the Germans had smashed through Belgium, the Netherlands, and France, had driven the Allied armies into the Dunkerque retreat, and only the ill-equipped RAF and the English Channel stood between Britain and an enemy astride the Continent. When Beaverbrook undertook to speed up the production of Spitfires and Hurricanes, "the speed and urgency of the job created a welter of labor problems. Green labor, mostly conscripted women and girls, had to be trained, billeted, settled into jobs, put on a ten-hour day, seven-day week schedule. New wage rates

SMITH, SIR BEN—*Continued*

had to be fixed somehow, and canteens provided in the factories; shop committees had to be set up, and a thousand other jobs done." In the Cabinet shuffle of March 1942 Smith's two years of work on these problems were recognized, and he was elevated to the junior ministry as Parliamentary secretary to the Ministry of Aircraft Production. "Since then," says Darling, "he has repeatedly surprised everybody with his clear understanding of the complex technical organization of the aircraft industry. He became a big-business executive, helping to direct at the top an industry which now [1944] produces thirty-five hundred aircraft a month." Smith also did some work in Civil Defense, and in 1941 he obtained from the Ministry of Health redress for the captured British seamen who had been freed from the prison ship *Altmark* by Captain Philip Vian '44, only to find that they were asked to make up the insurance payments they had missed or lose their pension rights.

In 1943 Smith was made a member of the Privy Council, and in November of that year was appointed Minister Resident for Supply in Washington, D.C., to succeed Colonel John Llewellin. After he had been in the United States for eleven weeks, working hard at four jobs (chairman of the British Supply Council in North America and of the Principal Commonwealth Supply Committee, British member of the UNRRA Committee on Supply, and senior alternate member on the UNRRA council), a London *Daily Express* correspondent asked Americans what they thought of Smith. Said the columnist Marquis Childs '43: "He speaks straight from the shoulder, more than any other man you have sent here. He is tremendously shrewd. He has worked very quietly, but effectively." Smith had impressed a group of editors of industrial publications with his knowledge of technical trade matters; and an unidentified official was quoted as saying, "Ben Smith is the finest shipment of reverse Lend-Lease ever sent here from the Old Country." After Smith resigned in May 1945 in order to campaign for re-election, and was knighted (K.B.E.) in June for his services, he was mentioned as the most likely choice to succeed Lord Halifax '40 as Ambassador to the United States, should the Attlee Government be unable to resist pressure to remove the Conservative appointee. Sir Ben was, however, chosen for the difficult and important post of Food Minister, again succeeding Colonel Llewellin.

"In his first press conference," to quote an American reporter, "Sir Ben was faced with the task of telling the British that, although the war is over, the sacrifices are not." Postwar rationing in Britain became even more severe after V-J Day. There was less meat, fats, and cheese; and the supply of dried eggs, which had largely replaced shell eggs in the British menu, was cut after the termination of Lend-Lease. Serious as Britain's economic position was, it was better than most of the rest of Europe, and her leaders felt the need of dipping into their own depleted rations to help maintain life on the Continent. One of the Food Minister's first announcements was that Britain would lend France fifty thousand tons of refined sugar and ten thousand tons of margarine, to be repaid later in raw sugar and ground nuts.

Sir Ben Smith's most obvious quality is said to be his toughness. "He stands well over six feet and in spite of his years his back is straight and broad, like a Guardsman's. He looks aggressive, although he is really a mild-mannered good fellow, one of the most popular members of the House of Commons, ever ready to entertain his friends with a never-ending flow of good stories and personal anecdotes." He is described as looking much younger than his years, and as being one of the best boxers and jujitsu artists among men of his age. Smith is a member of the City Livery and Royal Automobile clubs, and is a Liveryman of the City of London: he belongs to the Bakers' and Carmens' companies, two of the medieval guilds, which in these days carry on charitable work and elect certain officials, including the Lord Mayor. The Food Minister is given to wearing somber clothes and a wide-brimmed black hat, and has what the British call "a distinctive taste in stickpins."

SMITH, C(YRUS) R(OWLETT) Sept. 9, 1899- Air line executive

Address: b. American Airlines, Inc., 100 E. 42d St., New York City; h. 322 E. 57th St., New York City

"Aviation is the architect of a changing world," says C. R. Smith, the chairman of the board of American Airlines. The significance of this belief can be easily appreciated when considered in the light of the history of the airplane. Forty years after the appearance of the Wright brothers' first plane, the Office of War Information issued a report stating that in the postwar world an airplane trip from Washington to Paris will take only eleven hours, to Moscow sixteen, and to Tokyo twenty-two. Smith, a former deputy commander of the Air Transport Command, has been a leader in this growing industry since the twenties.

Cyrus Rowlett Smith (he now uses only the initials of his first and middle names) was born on the "wrong side of the tracks" in the city of Minerva, Texas, on September 9, 1899, the son of Roy Edgerton and Marion (Burck) Smith. During Cyrus Smith's early childhood the Smiths wandered over a wide area of Texas and Louisiana, stopping wherever the head of the family found work. When Cyrus was nine (according to a *Saturday Evening Post* article) his father, an "erratic religionist," left the family. There were seven children, and Cyrus was the eldest son. By cooperative effort and Mrs. Smith's expert management, the family was able to support itself: Mrs. Smith herself alternately taught school and kept boarders; and each child, as he or she became old enough, was sent to work, the earnings going into a common fund which in the end put all seven children through college.

When Cyrus himself was only nine he got a job as office boy to a cattleman in Amarillo, and from that time until he was sixteen he held various poorly paying jobs. His first important position came in 1915, when the First National Bank of Whitney hired him as a bookkeeper and spare-time teller at thirty dollars a month. The following year the enterprising seventeen-year-old moved on to greener fields and more money as bookkeeper in a cotton mill in Hillsboro. In three years time Smith was earning two hundred dollars a month, but in 1919 he left the mill in order to work in the franchise-tax department in the office of the Secretary of State in Austin. By 1920 he felt that he had had enough business experience, and now needed a formal education. At the age of twenty-one he therefore entered the University of Texas, in the School of Business Administration and Law. Besides attending school and working part time as an examiner with the Federal Reserve Bank, the industrious student conducted a one-man advertising agency, belonged to two fraternities, Alpha Kappa Psi and Kappa Sigma, and served as president of his junior class and the public speaking club.

When Smith was graduated in 1924 he took a regular position as a junior clerk in an accounting firm in Dallas for one hundred and fifty dollars a month, half of what he had earned through his advertising agency. In a short time he became known in his firm as an expert in business management. In that capacity Smith met A. P. Barrett, the Texas utilities magnate, who offered him the post of assistant treasurer in the Texas-Louisiana Power Company. Smith worked for the power company for three years. At the end of that time, in 1928, when the power company purchased Texas Air Transport, an air-mail line from Dallas and Fort Worth to Brownsville and Houston, Barrett persuaded Smith to assume the management of the line. In a short time it was consolidated with other lines, forming Southern Air Transport, which carried some passengers besides the mail. Smith, as treasurer of this enterprise and later as vice-president, was closely associated with the development of passenger service in Texas. During this period, too, Smith earned his transport pilot's license.

In 1929 Aviation Corporation bought a large share of the stock of Southern Air Transport, which developed into a nationwide airway. Smith as vice-president aided in the development of the southern transcontinental route which linked Atlanta and California. In 1930 American Airways, predecessor of the American Airlines, was created by Aviation Corporation as a means of coordinating several operating units into one, and Smith remained as vice-president of the new company, in charge of the southern division. This sprawling network of badly articulated air routes was losing money, and in 1934 when the Post Office Department canceled its mail contracts, reorganization of the entire company became necessary. In February 1934, therefore, a new company named American Airlines was created, and in October of the same year C. R. Smith became its president. Recalling those days, when at thirty-five he was called upon to devise some way to save the failing company, Smith has said: "One of the first things that we did as soon as possible after 1934 was to go back to system operation and control, as against divisional operation and control," which change eliminated criss-crossing and duplication in routes.

Harris & Ewing
C. R. SMITH

Immediately after the reorganization a five-year plan was initiated: Equipment was brought up to date and standardized to reduce costs and confusion in maintenance; Condor sleepers and day coaches were put into use, along with Vultee transports, making air travel swifter and more comfortable. When Smith became president of the lines he continued this policy of re-equipping and standardization, making American Airlines by 1945 the largest user of Douglas air equipment in America and the leading domestic air line in the country.

In April 1942 Smith resigned as president and director of American Airlines to enter the Army with a commission as a colonel in the Air Corps Ferrying Command. (Two years before, in July 1940, he had become adviser to Ralph Budd, president of the Burlington Railroad, who in the months before Pearl Harbor was in charge of coordinating all forms of transportation for the national defense.) The Ferrying Command had been established in May 1941, before the United States entered the war, to fly Lend-Lease planes bound for Britain to take-off points in America and Canada. After December 7 it became necessary to rush supplies as well as planes to American and Allied war theaters. In June 1942 the Command was therefore reconstituted and redesignated the Air Transport Command, with two divisions, Ferrying and Air Transportation. Major General Harold L. George '42 became commanding general and Smith chief of staff.

The ATC as reconstituted was charged with providing "all air transport for the War Department of cargo, personnel, and mail to, from, and between theaters of operations and within the continental United States." Through its ferrying division it was to ferry planes from factory to using locations both in the States and overseas. In addition, it was to provide air transport services for other Government agencies and for governments of the United

SMITH, C. R.—*Continued*

Nations. One of its outstanding operations proved to be the supplying of vital material to the China theater after the Burma Road was closed in 1942.

As chief of staff and later as deputy commander, the former air-line official mapped many of ATC's new routes, and located and developed many of its airdromes. By the end of 1943 the Command was operating over air routes in the United States totaling 35,000 miles and overseas air routes totaling more than 95,000 miles. According to the *Official Guide to the Army Air Forces*, "a number of civil carriers entered into contracts with the Government under which they operated scheduled transport services with planes allotted to them by the AAF." American Airlines was the largest of these commercial companies to operate transatlantic ATC aircraft.

Major General Smith (he was made a brigadier general in October 1942, a major general in September 1944) retired from the service after V-E Day in May 1945. While in the Army he had received the Distinguished Service Medal, with a citation from General Henry H. Arnold '42 calling him "one of the world's greatest contributors to the development of military and global air transportation"; the Legion of Merit for his services as chief of a special mission to French West Africa charged with eliminating custom duties; and the Air Medal for rescue operations in Burma. He shared, too, in a Distinguished Unit Citation for ATC transportation of supplies to China.

On July 12, 1945, American Airlines announced the election of Smith to the newly created position of chairman of the board, and the election of Ralph S. Damon, formerly of Curtiss Wright Airplane and Motor Company, as president. Plans for the expansion of American Airlines have proceeded rapidly. On July 5 the Civil Aeronautics Board, with President Truman's '45 endorsement, approved a policy of allowing domestic airlines to enter the overseas field. The next month the Civil Aeronautics Board granted seven-year transatlantic operation certificates to Pan American, Transcontinental and Western Airlines, and American Airlines. (Previously Pan American had held exclusive rights to such operations.) American Airlines with the approval of CAB is going ahead with plans for a transatlantic route with stops in Newfoundland, Labrador, Greenland, Iceland, Glasgow, Foynes, London, Berlin, Copenhagen, Amsterdam, Stavanger, Oslo, Helsinki, Leningrad, Stockholm, Moscow and Warsaw. The company which now employs ten thousand people, four thousand of whom Smith is said to know, has plans for increasing its staff to fifty thousand.

The comment has been made that if there were an award for the model executive, tall, square-jawed C. R. Smith would win it: He is easy-going and slow-spoken, friendly in his relations with his employees, a good listener who weighs carefully the smallest detail before coming to a decision. Divorced from the former Elizabeth Lewis Manget of Dallas, Texas, he lives in a twelve-room house on a large estate at Sands Point, Long Island. The interior has been described as resembling "the Great American Southwest wing of a natural history museum." There are paintings of the West on the walls, wood carvings of cowboys and horses, mounted animal heads, Navaho rugs, and a phonograph with records of doleful cowboy songs. In this setting, and in his office, he thinks, lives, and talks aviation. "We are all proud of the eighty-six planes we have," he said of American Airlines in 1945," and we will be prouder of the one hundred planes we will soon have. But any employee who can't see the day when we will have one thousand planes had better look for a job somewhere else!"

SMITH, HOLLAND M(CTYEIRE) (mäk-tēr') Apr. 20, 1882- United States Marine Corps officer

Address: b. c/o United States Marine Corps, Washington, D.C.; h. 24 Virginia Ave., Montgomery, Ala.

Makin, Tarawa, Saipan, Iwo Jima—historic battle stops on the road to Japan in the Second World War—were American victories made possible to a great extent by the work of Lieutenant General Holland M. Smith. As second in rank to the Commandant of the Marine Corps, General A. A. Vandegrift '43, General Smith was commander of the Fleet Marine Force in the Pacific, where he commanded marine forces in action from the Gilbert Islands through Iwo Jima. General Smith is known as the "father of modern amphibious warfare," having undertaken to drill marines in ship-to-shore operations long before the United States entered the war. Shortly before the surrender of Japan he was made commanding general of the Replacement Training Command at San Diego, California.

This "Pacific Cyclone" is a Southerner, born in Seale, Russell County, Alabama, on April 20, 1882, and named Holland McTyeire Smith.

His mother was Corrie E. (McTyeire) Smith, and his father was John V. Smith, a Montgomery lawyer. Young Smith followed his father's profession: after graduating from Alabama Polytechnic Institute in 1901 with a Bachelor of Science degree, he went to the University of Alabama for legal training (LL.B. 1903). He was admitted to the Alabama bar in 1903, but after two years of clerking in a Montgomery law office, the twenty-three-year-old Smith was finished with his law career. He went to Washington, D.C., to ask his Congressman for help in obtaining an Army commission. There were no Army vacancies at the time, but there was an opportunity in the Marine Corps, whereupon young Smith asked: "What are the marines?" He has spent his life since then finding out.

On March 29, 1905, Smith was commissioned a second lieutenant in the Marine Corps. He attended the School of Application at Annapolis, after which he was sent to the Philippines. It was while Smith was training at Annapolis that he had met Ada B. Wilkinson of Phoenixville, Pennsylvania, at a dance. He was married to her when he returned from the Philippines in 1909, despite the "anti-Yankee doubts of the Alabama Smiths." The couple's roving existence has led them to such scattered points as Bremerton, Manila, Shanghai, Puerta Plata, Newport, Quantico, and New Orleans. Once within a two-year period the Smiths moved fourteen times. Smith's nickname is "Howlin' Mad," and neither he nor his close associates recall when and where it originated. But somewhere in the Philippines it emerged, and it has clung to him ever since.

After Smith's return from the Islands he was placed on expeditionary duty in Panama. In 1916 he was sent to Santo Domingo, where he saw service in several engagements. With the outbreak of the First World War, Smith left for France aboard the U.S.S. *Henderson,* June 14, 1917. He was then in command of the Eighth Company, Fifth Regiment of Marines, but as adjutant he later joined the Fourth Brigade of Marines, Second Division. During his two years of service in France, Smith participated in the battles of Château-Thierry and Soissons, the Champagne-Marne defensive, and the Oisne-Aisne and Saint-Mihiel offensives. For his "fine courage and remarkable ability," he was awarded the Croix de Guerre, with Palm. General Smith holds numerous other awards and citations, among them the Mexican Service Medal (1916), Purple Heart (1918), Meritorious Service Citation Certificate (1918), Victoria Medal (1918), Distinguished Service Medal (1943) with two Gold Stars (1944). But this growing accumulation of decorations one never sees except on the most formal occasions.

After his return to the United States, Smith was given successive posts at various Marine Corps stations. He then attended the Naval War College, and after completion of his course served on several plans and training boards. In 1924-25 he was chief of staff of the Brigade of Marines in Haiti, and later was on the staff of the commander of the Pacific Fleet Battle Force. By 1934 Smith was a colonel. The next year he became chief of staff and personnel officer in the Department of the Pacific, a post he held until his assignment as director of the Division of Operations and Training in 1937. He remained in the operations division, where he became a brigadier general in 1938, until 1939.

U.S. Marine Corps

LT. GEN. HOLLAND M. SMITH

In 1939, with the United States awakening to the growing war menace, it was seen that the need for procuring adequate equipment for the armed forces was a pressing one. General Holland Smith in April was called to Marine Corps Headquarters to become assistant to his old friend, Major General Thomas Holcomb '42, Commandant of the Corps. Smith recognized too the problem of lack of adequate equipment. In his early amphibious drills he had had to use two old, unsuitable launches. He started experimenting with Andrew J. Higgins '43 on landing boats, working with the shipbuilder on specially designed, fast, shallow-draft craft for landing both men and tanks. According to Josef Israels 2d in the New York *Herald Tribune,* Smith also experimented with a weird amphibious tractor which had been built by Donald Roebling for use in the Florida Everglades. These and other experiments resulted in today's amphibious tank and "the whole breed of landing craft" which carried our men ashore on the Pacific islands. (Rear Admiral Daniel E. Barbey '45 of the Navy is also one of the pioneers in this phase of amphibious warfare.)

Along with new equipment and methods, new blood poured in, and the strength of the Marine Corps increased to approximately five hundred thousand men. In September 1939 Brigadier General Holland Smith was given command of the First Marine Brigade. About a year later he took these troops to Cuba for training as amphibious fighters, but not until he and Holcomb had overcome the objections of Washington officials who were concerned over the lack of housing for the marines near Guantánamo.

After six months of training, during which it was enlarged, the First Brigade came back in May 1941, more than doubled in numbers, as the First Division, USMC, eight thousand strong. Their commander, "ruddier than ever,

SMITH, HOLLAND M.—*Continued*

had the two stars of a major general on his shoulder straps." He also had, in *Time*'s words, "a story of training to tell that will be required reading for other officers, if General Smith ever calms it down to writing." The pioneer work of Smith and his marines in Guantánamo is a story of hard labor and even harder training. When the First Brigade arrived at this Cuban outpost they were faced with the job of clearing swamps and building living quarters before they could start any training. Smith worked his men seven days a week, twelve hours a day. They cleared five hundred acres—twenty minutes to the acre—and constructed the necessary buildings at record speed. When ready for the special training which had brought them there, they were then put through their paces by the General. Day and night they practiced using small boats to get on and off transports, did landing party exercises, and seized beachheads, using special combat techniques. So successful were Smith's methods of training that he was afterward asked to teach the Army the fundamentals of amphibious warfare. With Vice-Admiral R. Kelly Turner '44 of the Navy he shares the credit for shaping the tactics of the forces that stormed Guadalcanal, North Africa, Sicily, and the Aleutians.

During the early stages of the war, while the General was training his men for combat, he had become eager to see active service himself. In October 1942 he joined Headquarters Company of the Amphibious Corps, Pacific Fleet, which later became known as the Fifth Amphibious Corps. In July 1944 he was appointed to his post as frontline commander of the Fleet Marine Force in the Pacific. That year he was also advanced to lieutenant general. In his post with the Central Pacific combat corps, Holland Smith had a hand in strategic and tactical planning and the supervision of the final training of the island invasion troops. (He was also commander in 1943 of the Amphibious Corps, Aleutian Islands.)

The "Old Man of the Atolls" has won fame on the battle-scarred beaches of the Pacific. Smith was in command of the landings on Makin and Tarawa in the Gilberts. The marines landed on Tarawa in November 1943 and seventy-six hours later that atoll fortress was taken. Smith, addressing the American families at home, aghast at the losses in battle, revealed that the marines on Tarawa had killed four Japanese for each marine lost; that Tarawa was taken only because of their "willingness to die." He admitted that mistakes were made in the first phase of the attack, but added that valuable lessons were learned in that battle which were applied in later operations. In the opinion of many high-ranking officers, the campaign was the toughest in the history of the battle-seasoned Marine Corps up to that time. The impatient, explosive General declared: "It took Europe nineteen years to learn how to fight Napoleon. . . .It took the marines just three days to learn how to storm an atoll fortress and dig the Japs out. . . .We've got the toughest and smartest fighting men in the world. But as long as the war lasts some of them somewhere will be getting killed. We have got to acknowledge that or else we might as well stay home."

Led by their pugnacious commander, Smith's leathernecks blazed a trail over the Pacific beaches, writing into American battle history the names of Kwajalein, Saipan, and Iwo Jima. Smith was on the command ship of Vice-Admiral R. Kelly Turner when the landing on Iwo Jima began on February 19, 1945. This eight-square-mile fortress was called by correspondent Robert Sherrod '44 "probably the world's most heavily defended island." The battle for the small lamb chop of rock, the costliest assault in the history of the marines, raged for weeks with unrelenting fury, costing as many American lives as Tarawa and Saipan combined.

And volcanic Iwo, "the nightmare of fire," was taken, after twenty-six days of the bitterest, costliest battle of the Pacific war up to then: Americans were in Japan's "backyard." Commanded by Smith, marines of the Third, Fourth, and Fifth divisions paid a high price for a victory which he called "incomparable in all our history as to completeness." During the fierce fighting Smith himself narrowly escaped a sniper's bullet while viewing the battle. Said one reporter, "Imagine Wallace Beery, clad in a spotted jumper, grasping a carbine, jumping up and down, alternately swearing and beaming over his spectacles, and you have Lieutenant General Holland Smith." "Howlin' Mad" is the traditional leatherneck, "outwardly hard-boiled, inwardly soft-hearted."

Holland Smith is a short, heavy man with a mustache. He wears glasses, and his eyes are described as "mild blue." He is a constant cigar smoker and a light eater; when he finds time for sports he plays tennis and golf. His fraternity is Alpha Tau Omega; his clubs are the Bohemian in San Francisco, Army and Navy in Washington, D.C., and Army and Navy Country Club in Arlington, Virginia.

In discussing the General, said to be of mercurial temper, kind but often profane, one writer declared, "Perennially truculent, Holland Smith would have been busted out years ago if he had not been the man and the marine he is." *This Week* has reported that "those who live closest to Smith describe his concern for the lives of his men as almost spiritual." He is very Marine Corps-conscious, warmly defending his service in the traditional interservice rivalry. On this score he argues with his blond, six-foot-tall son, John Victor (Annapolis 1934), who in 1945 was serving as aide to Admiral William D. Leahy '41. (Two of the General's favorite conversation topics are his grandchildren, Marion and Holland 2d.) Considered a military liberal, the elder Smith is constantly seeking improved techniques for amphibious warfare. And it is reported that he once sent General Holcomb a list of Marine Corps generals he thought should be retired to give younger officers a chance. The first name on the list was Holland Smith. On October 12, 1945, when he was in charge of the San Diego area, it was announced officially that Smith would request retirement the following spring, when he would be sixty-four years old.

Who's Who in America, 1944-45

SMITH, MARGARET CHASE Dec. 14, 1897- United States Representative from Maine

Address: b. House of Representatives Office Bldg.; h. 2745 29th St., N. W. Washington; Skowhegan, Me.

The first woman member of the United States House of Representatives' Naval Affairs Committee and the first woman to represent Maine is Margaret Chase Smith, who was elected in September 1944 to her fourth term in Congress. (Maine holds its Congressional elections two months earlier than the rest of the country.) Mrs. Smith, a Republican, has a record of progressiveness in labor legislation, and has on occasion bolted her party to follow her convictions.

The daughter of George Emery and Carrie (Murray) Chase, Margaret Chase was born in Skowhegan, Maine, on December 14, 1897. After attending the local grammar school she was graduated from Skowhegan High School in 1916 and obtained a teaching post. She set out to achieve success, it is said, via "a variety of occupations from telephone operator to ghost writer." A business executive for the Maine Telephone and Telegraph Company at twenty-one, Miss Chase then went to work in the executive office of the local country newspaper, the *Independent Reporter*.

After eight years there, she became in 1928 treasurer of the New England Waste Process Company at Skowhegan, and at the same time she became connected with the Daniel E. Cummings Woolen Company. In May 1930 Miss Chase was married to former State senator Clyde H. Smith, president of the Steward Goodwin Company at Bangor, Maine. Smith, then fifty-four, had been the youngest man ever elected to the State legislature, where he backed the old-age pension system, and was in 1930 chairman of the State Highway Commission and a Skowhegan selectman. (In forty-eight assorted candidacies during his lifetime, Smith was never once defeated.)

Mrs. Smith became active in politics, doing "a thousand thankless party tasks," and was elected to the Republican State Committee of Maine, on which she served from 1930 to 1936. She is also past president of the Maine Federation of Business and Professional Women's Clubs. From 1932 to 1936 her husband was a member of the Governor's Council; and in September 1936 he was elected to the Seventy-fifth Congress as Representative from the Second Maine District. Congressman Clyde Smith worked on the House Labor Committee, on which he helped formulate the Wages and Hours Act which Chairman Mary T. Norton '44 successfully steered through the House, while his attractive wife put in fifteen hours a day as his secretary. She took care of all the Congressman's routine office work, personally handled his mail, and did research on the subjects of various bills. The Smiths always kept open house at their home in the Washington suburb of Chevy Chase, Maryland (later in Cleveland Park), and during the summer in their thirty-room Skowhegan residence. Margaret Smith found time also to serve as treasurer of the Congressional Club, composed of the wives of Congressmen and Cabinet members, and to bake the beans which, in the New England tradition, always graced the Smith table on Saturday evening.

MARGARET CHASE SMITH

In April 1940, in his last illness, Clyde Smith appealed to the Maine voters to preserve their social gains and ensure the continuance of his liberal policies by electing his "partner in public life" to succeed him. At the special election on June 3 the tall, gray-haired widow was chosen to fill the unexpired term; and in September 1940 she was re-elected to the Seventy-seventh Congress by 57,152 votes out of 88,486—nearly three times her late husband's 1938 plurality. As the representative of an industrial district, the first woman Congressman from Maine requested a seat on the Labor Committee on which her husband had distinguished himself. She was assigned, however, to three lesser committees: Education, Invalid Pensions, and Post Offices and Post Roads. (It is in committee that "the real work of Congress" is done, as the committees determine what bill shall be brought to the floor for a vote, and in what form—and which bills shall be pigeonholed and left to die.) A quiet, conscientious legislator, Margaret Chase Smith generally voted along regular Republican lines, but cast an occasional vote for Administration measures. From the beginning, however, she voted 100 per cent for the Administration's foreign policy. Daughter of a seaboard state, Mrs. Smith has always been interested in maritime affairs, and advocated naval expansion in the neutral days of 1938.

Re-elected to the Seventy-eighth Congress, Mrs. Smith asked in January 1943 if she might fill a vacancy on the Naval Affairs or the Appropriations Committee: "The reason why I'm asking to be on the Naval Committee," she said, "is Maine's long coastline, shipbuilding, and Navy Yard interests." This was done, "in recognition of the services of the Navy's women reserves, the Waves, Spars, and Marines." In this capacity the Maine Representative was given "good" assignments, such as the investigation of destroyer production; she is believed to be the first woman ever to sail on

SMITH, MARGARET CHASE—*Continued*

a United States destroyer in wartime. Mrs. Smith is the author of the bill raising the maximum Wave rank from lieutenant commander to captain, entitling Waves to dependents' allowances (except for husbands), and allowing the assignment of Waves to duty overseas. The bill was passed by the House without debate on June 8, 1943, although a similar proposal by Melvin Maas several weeks earlier had been defeated. The overseas clause was, however, stricken out by the Senate Naval Affairs Committee.

Reintroduced a year later, after Admiral Nimitz '42 had reported a pressing need for 5,000 Waves, 1,535 Marines, and 150 Spars at Pearl Harbor, it was requested by Secretary Forrestal '42 and high-ranking officers of the Navy. For reasons not entirely clear, action was postponed until after the Congressional summer recess: and it was not until September 1944, when Mrs. Smith withdrew her bill in favor of Senator David Walsh's "watered-down version," that the Senate finally allowed volunteers to go overseas, and sent that bill to the House, where it went through in less than sixty seconds. At this time Mrs. Smith reported that women's naval services totaled 103,872 members. During this time and up to December she was conducting an exhaustive inspection of their installations. In December, before leaving with other committeemen for a tour of advance South Pacific bases, she recommended that plans be made for the demobilization of the women; that housing arrangements needed modification; and that at least a skeleton organization should be continued after the war. Upon returning from her 25,000-mile inspection tour, Mrs. Smith submitted recommendations for improvement of morale and living conditions at the bases. They were adopted and put into effect by Navy Secretary James Forrestal, who praised her work.

Mrs. Smith and Winifred Stanley '43 of New York were the first women members of Congress to declare for the Equal Rights Amendment, sponsored by the National Woman's Party and the National Federation of Business and Professional Women's Clubs, which has been introduced at every session since the suffrage amendment. (This proposed amendment, which states that men and women shall have equal rights in the United States and all places subject to its jurisdiction, was defeated because it could be so construed as to invalidate existing health legislation.)

In Congress Mrs. Smith followed the party line. She voted against the twenty-five-thousand-dollar (after taxes) limit on salaries; for the income tax bill which broadened the tax base to include more people with small incomes; for the Ruml '43 "pay-as-you-go" tax plan, which "forgave" rich and poor alike a full year's taxes; for the Carlson-Ruml bill, and against the Robertson-Forand compromise. On farm affairs, she opposed incentive payments to farmers; voted against increasing the appropriation for soil conservation, against any funds for crop insurance, and against spending any more on rural electrification. Her vote was cast for the liquidation of the Home Owners Loan Corporation; against the use of appropriations to subsidize price rollbacks, to override the veto of the Commodity Credit Corporation bill which carried that rider, and in February 1944, to ban such food subsidies outright. On the record, she voted to abolish the OWI's domestic branch; to investigate the Government seizure of Montgomery Ward's Chicago facilities in May 1944; to create the Smith Committee, under an Administration critic, Howard W. Smith '41 of Virginia, which would investigate any alleged overstepping of authority by the executive branch; and to continue the Dies Committee to Investigate un-American Activities. In January 1945, however, when Martin Dies '40 was no longer in Congress, she was one of the thirty-four Republicans and one hundred and fifty Democrats who unsuccessfully opposed the establishment of the committee as a standing body.

On certain points the Republican leadership was in accord with the Administration: extending Lend-Lease, which they had opposed before the war; passing the Fulbright '43 resolution pledging the country to join in a world peace organization; passing the anti-poll tax bill. In addition, Mrs. Smith also voted to support the Administration by opposing the [Howard] Smith-Connally '41 anti-strike bill (she had previously helped vote down more stringent ones), and used her vote, unsuccessfully, against overriding the President's veto. She also voted with the Administration to increase the pay of Federal employees in view of the increased cost of living, and against the reduction of OPA funds, although she had had to make representations to the OPA for her lumbermen constituents. In addition, she was one of a half-dozen Republican Congressmen, led by Representative Charles LaFollette of Indiana, and Charles Wolverton of New Jersey, who broke away from the party to vote for the George demobilization bill.

In March 1944 she joined with the House's six other women to beat by 64-59 the Taber proposal to cut in half the appropriation for community facilities. Representative Smith, who seldom enters debate, told the House that on her trips with the Naval Affairs Committee she had found war workers' children locked in automobiles because their parents had nowhere else to leave them, and declared that Congress had already waited too long in meeting this emergency. In December 1944 the Maine Representative was one of six Republicans voting against freezing the Social Security tax at its present and allegedly inadequate level, a measure carried by 262 votes to 72. Earlier she voted against the bill to punish absenteeism from war work. Representative Smith helped to defeat a roll-call vote on the Worley Federal soldier-vote bill, which would have recorded each Representative's stand. (The bill itself was later defeated in a teller vote.) In the subsequent passage of the compromise bill, the Eastland-Rankin '44 (States' rights) soldier-vote bill, Mrs. Smith voted "Yea."

Mrs. Smith's record was acceptable to her constituents, for in September 1944 she was re-elected to the Seventy-ninth Congress, with the endorsement of A.F. of L. leaders and the support of the railway unions. No desk-bound Congressman, the Maine Representative had returned from an investigation to issue a report in February 1944, had served in April as one of thirteen advisers to the United States Government delegation at the International Labor Organization in Philadelphia, and had led the Maine delegation to the Republican National Convention in July. And in December she left for the South Pacific, returning in time for the opening of the Seventy-ninth Congress in January 1945.

After the fall of Germany, Mrs. Smith proposed that wives be permittted to join husbands assigned for an indefinite stay or a period of one year or more in occupied Europe. She said, according to a report in the New York *Herald Tribune*, that her "proposal was prompted by her desire to prevent further disintegration of the American home and the American family life." This is reported to have brought a promise from the War Department that families and fiancées of service men in occupied Europe would be allowed to join them "when conditions permit." In addition to her study of more complicated problems, the Congresswoman is also "mindful of details." Josephine Ripley, in the *Christian Science Monitor*, pointed out that Mrs. Smith "has gone to bat repeatedly for the bell-bottom-trouser boys with urgent pleas for redesigning of their pocketless uniform, and she now has word that action may be taken in this direction as soon as textiles are in normal supply again."

"Hardworking" and "well-liked" are the adjectives applied to Margaret Chase Smith. Delos Lovelace calls her "a sturdy Mainite, tall, assured, and pleasant to look at." Her short gray hair is streaked with white, perhaps the only dramatic touch about the "quiet and unassuming" Representative, and she is described by an NEA correspondent as having a trim figure and "a well-turned ankle." Like most women in public life, she feels that women Congressmen "must be treated like the men treat each other. We women represent all the people in our districts," she points out, "just as the men do." As for the duties of citizenship, Mrs. Smith declared, in a speech at the seventy-fifth anniversary celebration of Wilson College in October, that good citizenship calls for independent thinking and translating thought into action at the polls. She added, according to the New York *Times*, that when we accept the statements and proposals of demogogues "because we are too lazy to think and test their statements and proposals," we can blame no one but ourselves for subsequent events.

SNYDER, JOHN W(ESLEY) June 21, 1896- United States Government official

Address: b. Office of War Mobilization and Reconversion, Washington, D.C.; h. Wardman Park Hotel, Washington, D.C.

By the end of the first quarter-year of President Harry S. Truman's[’45] Administration, John W. Snyder, a relatively unknown Missouri banker, had been twice elevated to new office in the Government. Snyder was Truman's first major appointee when in April 1945 Truman gave him the post of Federal Loan Administrator which had remained vacant after Fred M. Vinson[’43] had resigned to become Director of War Mobilization. In July Snyder again succeeded Vinson, becoming chief of the expanded Office of War Mobilization and Reconversion when his predecessor received the Treasury post. Three weeks later the sudden ending of the war in the Pacific plunged the new Director of War Mobilization and Reconversion into the midst of the problem of guiding the nation's economy back to a peacetime basis.

JOHN W. SNYDER

John Wesley Snyder was born on June 21, 1896, in Jonesboro, Arkansas, the son of Jerre Hartwell Snyder, a druggist, and Ellen (Hatcher) Snyder. He received his early schooling in Jonesboro, attending the Jonesboro High School from 1910 to 1914. In 1914 he entered Vanderbilt University (Nashville, Tennessee), but withdrew in 1915 without obtaining a degree. The year and a half between the fall of 1915 and the spring of 1917, when he entered the Army, Snyder spent on business trips with his uncle, Judge E. A. Rolfe, in connection with the latter's farming, timber, and banking interests. During the First World War Snyder served as a captain in the Fifty-seventh Field Artillery Brigade of the Thirty-second ("Red Arrow") Division. Contrary to popular report, he did not serve in the same army unit with Truman, nor did they train together before going overseas. Snyder met Captain Truman by chance in 1918 when both were with the AEF in France. For several summers after the Armistice, however, Snyder and Truman trained together in the Officers' Reserve Corps (Snyder is now a colonel, Field Artillery Reserve) at such Army posts as Fort Riley in Kansas, Fort Sill in Oklahoma, Camp McCoy in Wisconsin, and Fort Ripley in Minnesota.

Between 1919 and 1930 Snyder served in various banks in Arkansas and Missouri, learning his profession. Then in 1930 he became national bank receiver in the Office of the Comptroller of the Currency, Washington, D.C., a position in which he supervised the liquidation of bankrupt financial institutions.

SNYDER, JOHN W.—*Continued*

In 1937 he was appointed manager of the St. Louis Loan Agency of the Reconstruction Finance Corporation. In July 1940, although retaining control of the St. Louis RFC, he was brought to Washington by Jesse Jones '40 to be executive vice-president and director of the new Defense Plant Corporation and assistant to the directors of the Reconstruction Finance Corporation.

As director of the Defense Plant Corporation, a subsidiary of the Reconstruction Finance Corporation, Snyder handled between five and eight billion dollars in expenditures for war plant expansion; and he earned the respect of his colleagues for his ability to get things done despite red tape and occasional sharp differences of opinion with Jesse Jones, then head of the RFC. Whereas Jones believed in cautious, orthodox financing for the war plants, Snyder was convinced of the necessity of speedily augmenting the nation's armament program to the fullest extent. Accordingly, he brought to bear on Jones all the pressure he could muster, including persuasion from the War Department, in order to expedite the task of arming the country.

While DPC head, Snyder was also one of the few men well aware that the allocation of contracts during the emergency would determine the existence or non-existence of monopoly in postwar commerce. His associates in the Defense Plant Corporation say that he fought vigorously and constantly for a program which would leave final disposition of the Government-financed plants under governmental control and would deny to the industries concerned the option of "scrapping the wartime plants so that they could limit production, prices, and employment."

In January 1943 Snyder returned to private banking, resigning from his Washington office on the first to accept the vice-presidency of the First National Bank of St. Louis, Missouri. On February 15 of that year he also resigned from the managership of the St. Louis RFC, which post he had, during the latter part of his tenure, held simultaneously with the DPC directorship. He thus severed, at least for the time being, all official relations with the Government. Early in 1945, however, Snyder's name was suggested to President Franklin D. Roosevelt '42 for the office of Federal Loan Administrator by both Truman and Jones, and, when Truman himself became President, this was one of the first nominations he sent to Congress. Thus on April 30, 1945, Snyder again found himself installed in a Federal post. On the appointment, Jesse Jones, former incumbent of the office, commented, "The President could not have made a better appointment for Federal Loan Administrator than John W. Snyder. Mr. Snyder's long experience with the RFC, both in the field and in Washington, has made him thoroughly familiar with the activities of the loan administration." (From April 1939, when it was created, to February 1942, the Federal Loan Agency had been administered independently of the Department of Commerce. At that time, Jesse H. Jones being already both Federal Loan Administrator and Secretary of Commerce, Executive Order 9071 had transferred its functions to the Commerce Department. When early in 1945, however, Henry A. Wallace's '40 name was suggested as Secretary of Commerce, Congress, not wishing to grant Wallace the extensive powers of the combined post, passed the George bill to redivorce the two agencies. Wallace then received the Commerce post; Fred M. Vinson the Loan post. In April Snyder succeeded Vinson.)

As Federal Loan Administrator Snyder became principal adviser on economic and monetary policies to the Truman Administration. The post, furthermore, placed him directly in charge of a large part of the reconversion program, because the RFC, as the parent corporation, exercises general supervision over the management of its otherwise autonomous subsidiaries, such as the Rubber Reserve Company, the Metal Reserve Company, the Defense Plant Corporation, the Defense Supplies Corporation, and the Disaster Loan Corporation. All together, these agencies, during the past thirteen years, have made loans to the extent of forty-five billion dollars. And on the one hand the Surplus Property Board made the RFC its agent in disposing of the surplus Government-owned war plants in such a way as to promote the Government's full employment program; on the other, business interests looked to the RFC "to pump needed reconversion credits through the banks." Snyder's first act in the post was to request Congress to pass legislation enabling the RFC to absorb its subsidiaries in the interests of economy and efficiency. The simplification of the agencies, merely organizational in nature, involved no changes in policy or personnel, but was directed towards reducing operating costs and was influenced by Snyder's ultimate aim to restore to private industry economic activity temporarily undertaken by the Government.

During his association with the Defense Plant Corporation Snyder had demonstrated that he was essentially a "profit-system man" and a good friend of small business by his retention of control over surplus plant disposal in order to discourage future monopoly. When Henry Wallace as Secretary of Commerce wanted to gain the support of small business early in 1945 by appointing a committee to consider its welfare, he chose from among others on the Commerce Department's Business Advisory Council John W. Snyder. At a banker's seminar at the University of Missouri in 1941, Snyder had explained his views: "The defense program," he said then, "is designed to protect a democratic system, founded upon private initiative and individual liberty. Sacrifices of certain privileges will be only the legitimate means to a vital end . . . defending our ideal of democracy . . . and the system of private initiative which is its very foundation. Bankers can . . . serve as guides in pointing out the way back after difficult days." Hence, he emphasized in a news conference that the RFC was not entering into competition with private banks in making loans but "was supporting the banks themselves to enable them to make loans beyond their normal lending limit and to take risks that they might not otherwise be prepared to take." Direct loans by the RFC, he said then, would be made only when it was determined that local credit was not available after "reasonable efforts" had been made to obtain it. The loan policy of the RFC through the banks, however, he said would be a liberal one, intended to speed the successful conclusion of the war with Japan and the resumption of normal private enterprise.

"With or without banking participation," depending upon the degree of cooperation he received, Snyder indicated that the specific program of the Federal Loan Agency would embrace five main points: "(1) To make loans against terminated contracts and subcontracts for the purpose of making funds available for other war production. (2) To make loans for civilian production, and for reconversion and other purposes. (3) To finance plant and equipment reconversion, to finance new equipment and plant purchases, and to finance surplus property and surplus equipment purchases. (4) To make business loans to returning veterans under its own veterans' loan program, and to perform its present functions as well as others which the Veterans Administration may request under the Servicemen's Readjustment Business Loan Program. (5) To make commitments now for future loans so that industry may proceed with plans for rehabilitation and reconversion." Loans were to be made strictly on a business basis: credit to be extended "to those people who have demonstrated that they deserve it." "It is my opinion," Snyder told the House Small Business Committee, "that together the banks and the RFC can solve the financial problems of small businesses which are capable of and entitled to solution during the reconversion and postwar periods."

In mid-July 1945 Snyder was promoted from the Federal Loan Agency to the Office of War Mobilization and Reconversion. That agency was created by Executive order in 1943 "to develop and establish programs for the maximum utilization of the nation's natural and industrial resources for military and civilian needs, the effective use of civilian manpower, and the maintenance and stabilization of civilian economy . . . [with] power to unify the activities of Federal agencies and departments concerned with production, procurement, distribution, or transportation of military or civilian supplies and materials." (The definition is by Smith and Zurcher in *A Dictionary of American Politics.*) Once in office Snyder had the heads of the various agencies under his control prepare their programs for the transition period. When the Japanese surrender offer came just three weeks later, therefore, he was ready to direct the reconversion plan. His first report to the President, "From War to Peace: a Challenge," issued on August 15, predicted "considerable but temporary unemployment" and set forth full peacetime production and a steadily rising standard of living as objectives which if achieved would tide the nation over the transition period of heavy demand and short supply. Then, with the Presidential announcement of surrender, he began canceling all military contracts above a minimum necessity and abolishing many of the wartime production, distribution, price, and wage controls. By the middle of September even most of the curbs on the crucial construction industry had been lifted. In fact, he moved so fast that his opponents charged that he was paving the road for runaway inflation. (Snyder has been both praised and criticized for the manner in which he has handled reconversion.) In addition, during the first weeks of peace, he was called upon to solve the redeployment transportation crisis, passed on to him by the Senate's Mead committee, and to arbitrate the dispute between the armed services and the fuel control agencies over manpower to operate the coal mines. At the end of September Snyder spent two weeks in Europe surveying the surplus and lend-lease property situation. In December he drew up the housing program adopted by the President and placed under the administration of Housing Expediter Wilson W. Wyatt.

In guiding the nation back to a peacetime economy Snyder advocated larger unemployment benefits and passage of President Truman's full employment bill. In his first quarterly report he predicted that there might be as many as eight million unemployed by the spring of 1946 and called for a 40 to 50 per cent increase in the supply of goods and services to absorb these expected unemployed. He also advocated repeal of the normal and excess profits taxes, reduction of the excise taxes, and an increase in the 40-cent legal wage floor. While he declared himself in favor of raising wages when such rise would not affect prices, Snyder went on record as a supporter of continued price control for essential items until supply could catch up with demand. "Untimely removal" of such war curbs, he believed, would "delay reconversion" as much as the removal of restrictions on production would hasten it. A lifelong foe of bureaucracy, Snyder expects that his last measures as Director of Reconversion will be the abolition, in accordance with a specific Congressional directive "to plan to simplify, consolidate, or eliminate the emergency war agencies," those numerous war-born bureaus which have of necessity interfered with the functioning of the competitive enterprise system during the last five years.

Snyder, who was often consulted by Truman while the latter was still a Senator, is described by *Business Week* as a realist. His former associates in the Defense Plant Corporation point out that he knows when to fight and when to retreat and that he never opposed Jesse Jones when he knew that defeat was certain. He is known as a hard worker who frequently spends ten to twelve hours at his desk. An avid reader, he tries to find time for four books—two of biography, one of history, one novel—each week. Like many of Truman's friends, he plays a close game of poker. He collects United States coins and airplane pictures, and his favorite sport is baseball. The most common adjective used of Snyder physically is "rotund." He is five feet nine inches in height, weighs 170 pounds, has gray eyes, and dark brown hair which is turning gray and receding at the temples. He uses gold-rimmed spectacles and, unlike most people, wears his watch on his right wrist, where it is always in front of him. He is an Episcopalian and a Democrat. A charter member of Rotary, he is also a member of Alpha Tau Omega and president of the Missouri Athletic

SNYDER, JOHN W.—*Continued*

Club (of which he was vice-president in 1944-45 and has been on the Board of Governors since 1940). In addition, he is a director of the Chase and Coronado hotels in St. Louis. On January 5, 1920, he was married to Evlyn Cook; the Snyders have one daughter, Edith Cook, who in 1945 was a college student.

Who's Who in Commerce and Industry (1944)

SOULE, GEORGE (HENRY, JR.) (sōl)

June 11, 1887- Editor; economist

Address: b. New Republic, 40 E. 49th St., New York City; h. South Kent, Conn.

"Anyone who reads Mr. Soule puts himself in touch with one of the sanest and most civilized minds now at work on man and his problems," H. D. Lasswell has written of George Soule. A leading liberal economist, Soule has written several books of social theory, his latest being *America's Stake in Britain's Future*, published in October 1945. For more than twenty years the social scientist has been an editor of the *New Republic*, in which his articles on the problems of modern society have appeared since 1914. Soule has been associated with important economic research agencies and has taught at Yale Law School, Columbia, and the University of North Carolina.

Arni

GEORGE SOULE

A descendant and namesake of a signer of the Mayflower compact, George Henry Soule, Jr., was born in Stamford, Connecticut, to George Henry and Ellen (Smyth) Soule on June 11, 1887. His American heritage includes one ancestor who participated in the Boston Tea Party and several who fought in the American Revolution. According to Soule, his "most prized progenitor was Robert Calef, who wrote a book satirizing Cotton Mather and the Salem witchcraft persecutions—a book banned by the conservatives of the time and sold from under the counter in Cambridge, Massachusetts." After attending Stamford High School, where he was editor of the school paper, young Soule entered Yale University, where he became editor of the *Yale Literary Magazine*. Soule's major studies in college were English and economics. After earning his B.A. in 1908, he joined the New York publishing firm of Frederick A. Stokes, of which he later became advertising manager. While with this company Soule became editor of the first publishers' cooperative bulletin on books, "an attempt to present bona fide news of new books without praise of them." Of this venture Soule says, "My interest in the success of the esthetically meritorious books came into constant collision with exploitation of so-called 'popular' taste, and I began to believe that something better than a commercial civilization was necessary if cultural values were to be well served."

Soule joined the staff of the *New Republic* soon after its founding in 1914. In those early days of the liberal weekly his duties ranged from proofreading and make-up to editing art criticism and writing articles. He became increasingly interested in public affairs, and began combining the economic with the literary in his work. After the First World War began, Soule enlisted in the Coast Artillery and soon became a corporal. In August 1918 he was detailed to study antisubmarine devices at New London, Connecticut, and in his new post achieved the unique military grade of "First Class Listener." In September he was sent to Officers Training School at Fort Monroe, Virginia, and after two months was commissioned a second lieutenant, just as the Armistice was declared.

Discharged from service, the writer rejoined the *New Republic*, becoming its Washington correspondent. Early in 1919 he became a member of the editorial staff of the New York *Evening Post*. Soule also served in that year as an investigator for the Inter-Church World Movement Commission on the steel strike. The war had reinforced his belief in the need for social and economic reform. With Stuart Chase '40 and others, therefore, he founded the Labor Bureau, Inc., in 1920, to carry on technical and professional work for labor and cooperative organizations. He has since been a director of the bureau, winning recognition for his economic research.

For the first three months of 1921 Soule was a statistician for the *Nautical Gazette*. Since 1922 he has been director-at-large of the National Bureau of Economic Research. On January 1, 1924, he became an editor of the *New Republic*, and in his long association with the magazine he has been concerned in his writings with socio-economic topics. In 1927 he was special adviser to the Secretary of the Interior on reclamation and rural development in the South. His articles have appeared in many magazines, including the *Independent Woman*, the *Virginia Quarterly Review, Current History*, the *Dial*, the *Nation*, the *Saturday Evening Post*, and the *American Economic Review*. He has also written pamphlets and various reports and scientific papers, and his articles are included in several essay collections. He has been called "the first person to have introduced case methods into industrial economics."

Following the First World War many of Soule's writings were on the seething labor situation, with attention centered on the unions. In the February 1924 issue of the *Atlantic Monthly* his "Unions and the Public" was a lengthy study with factual, statistical data. During the depression period the economist discussed its causes and cures in the pages of the *New Republic* always urging economic planning to avoid such disaster. With the advent of the New Deal Soule focused his study on its economic program, analyzing the Administration measures instituted. In an article in *Harper's* (June 1938) entitled "Capitalism Without Capital," the economist declared that such measures were "buttressing capitalism and renewing confidence in it." Turning his attention in 1937 to political affairs, Soule in a radio address urged that the Neutrality Act be invoked in the Sino-Japanese war.

After the outbreak of the Second World War, when America was gearing itself for national defense, the economist offered this reminder in March 1941: "Everybody knows, as a result of what happened last time, that war prosperity is fallacious and fickle." A *New Republic* article in March 1943 dealt with Soviet-American relations and the problem of the Prussian military caste. On the first-named subject Soule pointed out that a large segment of America feared and distrusted the Soviet Union because "it is the living representative of a socialist state." On the other topic the writer declared that "those who believe that Europe can have no assurance of peace until the Prussian military caste is finally liquidated are talking sense."

Seeing little danger of communism in a flourishing economy, Soule advocated the closest cooperation between the Soviet Union and the Western powers. In *Foreign Affairs* in April 1944 ("Labor and the Peace"), the economist contended that "Labor knows how to preserve private enterprise far better than does an organization like the National Association of Manufacturers. It continually presses for those modifications which can make private enterprise tolerable to workers who might otherwise wish to abolish it." Previously, in a *New Republic* article, Soule had stated, "If private enterprise were the flexible and efficient system which those who praise it say it is, there would be little trouble." In 1945 he wrote several articles on British and American economic policy, coincidental with his book on the subject. The *Annals of the American Academy of Political and Social Science* contained such a study of Anglo-American economic relations, in which Soule concluded that "basically, the questions about future British trade and exchange policy must be answered in the United States." Again advocating planning for full employment, he declared, "The ultimate alternative to stabilized full employment in the United States is likely to be economic isolation enforced upon us by other and more progressive nations."

Soule is the author of more than ten books on social theory, which have commanded the respectful attention of critics. *Planned Society* (1932), which discussed the possiblities of a planned system in the United States, received divergent but largely favorable reviews. Typical were the remarks of the *Saturday Review of Literature* critic: "Whether one agrees with Mr. Soule's conclusions or not, both his arguments and his assertions of fact are, almost without exception, sound, accurate, and illuminating." Two years later, in *The Coming American Revolution*, Soule found the United States in the midst of a great social revolution, far from its climax. According to the economist another breakdown of capitalism, such as the depression, is likely to come; if accompanied by certain revolutionary conditions, "at such a time, probably by peaceful and possibly even by constitutional means, the control of production and exchange may easily pass to one of the more moderate movements opposed to the profit system." E. H. Walton, in reviewing this book in *Forum*, stated, "Mr.Soule is one of the ablest and most clearheaded of our more advanced writers on economics, and this, so far, is the best of his books." In the New York *Herald Tribune* Lewis Gannett '41 wrote, "Mr. Soule, if less brilliant than Stuart Chase at his best, less lucid than Walter Lippmann '40, has more courageous realism than either."

In *The Future of Liberty* (1936) the writer presented an historical analysis of liberty in America, concluding with a reasoned advocacy of socialism as true liberty for the greatest number. Soule stated his own credo in this book. "My bias is democratic and liberal," he declared. "I believe in the right of the individual to seek his own fulfillment, in equality of status, in the attempt of man to control his own destiny. . . .I believe in the right to question all creeds and institutions in the light of reason, in a continually recurring need to reject and build anew. I believe in the legitimacy of revolution: not merely the revolution that my forefathers helped to make in the eighteenth century, but any new revolution that may be justified by the interest and reason of the common man." Soule considers his faith rooted in American soil by the Declaration of Independence and the Bill of Rights. While opposed to Soule's theories, Henry Hazlitt in the New York *Times* nevertheless found the author "intelligent, well read, and restrained in tone. He is one of the most persuasive of the planners. But his replies even to the criticisms that he cites seem to be often feeble and evasive."

Combining biography and sociology, Soule's next book, *Sidney Hillman, Labor Statesman* (1939) was called "an exciting and altogether important chronicle, clearly and factually set down." That year also saw the publication of *An Economic Constitution for Democracy*, a compilation of lectures he had delivered at Yale Law School in an analysis of the economic aims and achievements of the New Deal. Soule's next study in social theory, *The Strength of Nations* (1942), urged a "psycho-social approach" to world problems. Critical opinion agreed that it was a significant and provocative work, but Frank Kingdon '44 considered the book "weakened by the fact that it is the brief

SOULE, GEORGE—*Continued*

of an advocate for science rather than an inclusive attempt to mobilize all the methods and motives that operate in men's conduct."

In collaboration with David Efron and Norman Ness, Soule wrote *Latin America in the Future World* in 1945, after two years of research. Prepared under the supervision of Alvin H. Hansen '45 for the National Planning Association (of which Soule was a founder), the book was hailed as a valuable, scholarly work, and Allan Chase declared that it could well become "the economic *Uncle Tom's Cabin* of the Western Hemisphere." After a visit to England in December 1944 and January 1945 on an unofficial research mission, Soule wrote *America's Stake in Britain's Future*, which was published in October 1945. This "significant and useful economic tract" advances the theory that the economic future depends upon whether the United States averts unemployment and depression. Soule contends that "the cornerstone of Anglo-American cooperation, which is regarded as essential, must be the adoption by both countries of a policy aimed at maintaining full employment within each. In one sense this is a matter for domestic decision within each of the nations, and yet upon it depends the gravest of international consequences." Norman Angell remarked that Soule's "useful contribution comes at precisely the right and urgent moment," while another reviewer pointed out that "it is dangerous both for the United States and Britain to place the whole, or the basic, case for Anglo-American cooperation on economic grounds."

According to *Time* Magazine, Soule is known in liberal circles for "his antiseptic aloofness," while in the opinion of Professor Carl Beck he "belongs with those Socialists of the Norman Thomas '44 brand who believe that it is necessary to socialize the means of production, but differ from the Communists in believing that the means of production can be socialized by peaceful democratic procedure." Soule is a Fellow of the American Association for the Advancement of Science and a member of the American Economic Association. He is married to Dr. Flanders Dunbar (his third wife), a member of the faculty of the College of Physicians and Surgeons and managing editor of *Psychosomatic Medicine*. They have a daughter named Marcia Winslow Dunbar-Soule. In late 1945 the editor-economist is writing an economic history of the United States covering the twelve years from 1917 to 1929.

SPAAK, PAUL-HENRI (späk pôl äɴ″rē′) Jan. 25, 1899- Belgian Government official; lawyer

Address: b. Ministry of Foreign Affairs, Brussels

The Belgian Foreign Minister, Paul-Henri Spaak, was born in Brussels on January 25, 1899. His father Paul Spaak, a well known poet, was director of the Brussels opera, the Théâtre Royale de la Monnaie; his mother, an active Socialist, was Belgium's first woman Senator. Former Prime Minister Paul Emile Janson is his uncle. Paul-Henri was only fifteen when the Germans invaded Belgium in August 1914. Two years later, at seventeen, he was caught trying to cross the Dutch border in order to rejoin the Belgian Army on the Yser, and was therefore interned until the end of the war. After the war young Spaak studied law at the Université Libre de Bruxelles, a liberal-minded institution which became important when the Belgian Relief Commission under Herbert Hoover '43 presented it with their thirty-million-dollar surplus. The gift was made to the nonsectarian University of Brussels, rather than to one of the more prominent universities, because of political considerations. To this day, it is reported, there are annual street fights between students of Brussels and those of the Catholic University of Louvain.

Spaak received his LL.D. and was called to the bar at Brussels, where he practiced "brilliantly." He was an outstanding tennis player, too, and in 1922 was a member of the Belgian team in international competition. A Socialist like his mother, an eloquent speaker, and "a bit of a firebrand," in 1932 the thirty-three-year-old lawyer was elected Socialist Deputy for Brussels to the Chamber of Representatives of the Belgian Parliament, in which he has served ever since. Two years later he joined the staff of a revolutionary weekly, *l'Action civique*; he became co-editor. In March 1935 he accepted the post of Minister of Transportation, Posts and Telegraph in the Cabinet of progressive Paul van Zeeland—a coalition government, like most Belgian cabinets, which lasted until June. When Van Zeeland again became Prime Minister in 1936 Spaak was chosen Minister of Foreign Affairs. At thirty-seven he was one of the youngest foreign ministers in Belgian history.

The year 1936 was one of universal rearmament, the year of the founding of the Rome-Berlin-Tokyo Axis. "As in the hectic prewar days," to quote the historian F. L. Benns, "the vicious cycle of national fear and resultant increased armaments was once more present to undermine the peace of the world." In October Belgium announced her determination to resume a policy of neutrality, while at the same time increasing her military establishment to protect her neutrality. Both Britain and France promised Belgium their military support in case of unprovoked aggression. Foreign Minister Spaak and King Leopold '44 conducted the negotiations which resulted, in April 1937, in those two powers releasing Belgium from her obligations under the Locarno Pact of 1925 and the Anglo-Franco-Belgian Agreement of 1936, while reaffirming their protection of her neutrality.

In 1937 Spaak was chairman of the Nine-Power Conference in Brussels on Far Eastern questions. In November 1937 the Van Zeeland Government was succeeded by that of Spaak's uncle, the Liberal Paul Emile Janson, described as "something of an isolationist in foreign policy and a reformer in internal affairs." When this Government fell Paul-Henri Spaak became Premier; his Government lasted from May 1938 to February 1939, when he was succeeded by the Catholic Conservative Hubert Pierlot '43.

According to Lemuel F. Parton in the New York *Sun*, "as Spaak rose in politics, he moved more to middle ground, admitting the need for organization and discipline and pioneering authoritarian democracy," what Spaak himself termed "adapting democratic institutions to modern realities." Says Parton, "He has been effective against both the Communists and Fascists [Leon Dégrelle's Rexists], although his political enemies insisted that his allegiance was shifting to the latter when he aided in severing Belgium's old alliance with Britain, as he urged a defensive alliance of small neutral countries. This, it would appear, has been elaborately disproved."

On September 3, 1939, the day Britain and France declared war on Germany, Deputy Spaak was again appointed Minister of Foreign Affairs. Eight months later, on May 10, 1940, German troops marched into Belgium, Luxembourg, and the Netherlands, "in defiance of solemn engagements which Germany had renewed a few days before the invasion"; four hours later German Ambassador Bülow-Schwante called on Foreign Minister Spaak to notify him of the fact. At the end of the eighteen-day battle of Belgium, Spaak and the other Cabinet ministers went to France, where they were interned. After France was attacked Spaak and Prime Minister Pierlot escaped across the Spanish border on their second try. In Spain they were again kept in "enforced residence," reportedly on the demand of Nazi agents. After two months Spaak and Pierlot made their escape, and dodged the Gestapo for the five days it took them to reach Lisbon. On October 22, 1940, the two reached London, where Spaak took up the duties of Foreign Minister and Minister of Labor in the Belgian Government-in-Exile.

In June 1942 Paul-Henri Spaak and British Foreign Secretary Anthony Eden '40 signed two treaties, formalizing the agreements by which Belgian forces in Africa were to operate under the Supreme Command of the United Nations, and by which the British were to purchase all the gold, copper, and rubber produced in the Belgian Congo. At this time the Belgians had one squadron in the air and another forming. "They have contributed an extraordinarily large percentage to the fight against Germany," cabled a New York *Times* reporter. "The Germans would love to know the number of Belgians who are fighting against them in proportion to the number of Belgians at home; the Germans would love to know this because they would base their atrocities accordingly." Later, in February 1943, Spaak broadcast to the Belgian people the news that the Government "would continue her economic understanding with Luxembourg and would be ready to join in new and closer ties with the Netherlands and France, as well as endeavoring both in Europe and Africa to tie up her interests with Britain." That November Spaak headed the Belgian delegation to the United Nations Relief and Rehabilitation Administration Conference at Atlantic City, New Jersey, where he presided over the first meeting of the Committee on Organization and Administration.

In September 1944 Belgium was liberated, and later Spaak returned to London to "talk Western power bloc" with Anthony Eden, as *Time* put it. "The benefits of such a West European power bloc were chiefly political, but there were others: (1) Belgium and Holland have planned a trade agreement which is virtually a customs union, specifically designed with collaboration of France and Britain in mind; (2) Belgium hopes to coordinate her military policy with Britain's, pool her air force with the RAF." At this time Spaak was described by *Newsweek* as "the most popular and respected member of the Government." In London, in November 1944, he told newsmen that he had discussed "immediately equipping a Belgian Army so that it can participate in the occupation of Germany next spring." According to reports of the projected "Western bloc" (a term Spaak deprecates), France would maintain a strong army, Britain a powerful fleet and air force, while "Belgium and Holland would waive their former [prewar] attitude of neutrality to provide air bases near Germany's borders. After the Allied forces have been withdrawn entirely from Germany, this arrangement would give the Western alliance a combination able to act quickly in concert by sea, land, and air." Belgium made known, too, her reservation of the right to demand portions of former German territory. Wrote Homer Metz, "A coterie of extreme Belgian nationalists has agitated for a frontier on the Rhine for generations. Yet very few Belgians now believe that this would provide more than a tissue-paper bulwark against the renascent German militarism. If certain reports coming out of Europe are to be credited, Belgium is talking about extending its hegemony eastward chiefly because it wants a diplomatic weapon to counter what it fancies are threats to its independence in the collective security envisaged by the United Nations." This writer cites a dispatch from Brussels to the effect that "the Belgians also are somewhat apprehensive over what they believe may be imperialistic ambitions on the part of France. . . .The Belgians still remember

SPAAK, PAUL-HENRI—*Continued*

Napoleon . . . and the spread of communism in France also worries them."

Like other swiftly liberated countries, Belgium was suffering from a completely disorganized economy after the fighting had moved on past her borders, which led to a four-day uprising at the end of November. André Visson, describing Premier Pierlot as "honest, tired, and weak," stated that the two strongest men of the Cabinet were Spaak, who had the confidence of the trade unions, and Camille Gutt, the Conservative Minister of Finance. Alexander H. Uhl wrote in *PM*: "This crisis has all the characteristics of the late nineteen-thirties—the demonstrations in the streets, the placards denouncing the Government, the gendarmes too handy with their rifles, and the scared little men in Parliament seeing the revolution around the corner. Actually what you have is a Parliament whose mandate expired more than a year ago coming back to power as though the war and the occupation hadn't happened, and a Communist and working-class resistance group beating its head in frustration against what it feels is a stone wall of Belgian reaction."

A *PM* editorial by Blair Bolles headed "The People Can't Win Without Some Help" complained that "Belgian Socialists, represented in the Government chiefly by Foreign Minister Paul-Henri Spaak, have the name but not the inclination of radicals. It is a watered-down party, and Spaak dispenses reactionary dogma out of a book with a Socialist cover." Uhl pointed out, however, in a later article that the Socialists were in an intolerable position, forced to support a Government whose policies they could not approve, because no other was available. As Spaak retorted to Uhl, it was true that the Pierlot Government did not reflect accurately the true feelings of the Belgian people—but neither did the Communists. At the same time, however, Spaak was reportedly working to create a Leftist bloc. And in February 1945 the Pierlot Cabinet was finally replaced by that of the Socialist Labor Minister, Achilles van Acker. Spaak, who was on the way to Paris at that moment, was retained as Minister of Foreign Affairs.

It was expected that a stronger Government would "help to clarify the Belgian international position," and later that month announcement was made of four international agreements Spaak had negotiated with General de Gaulle '40 and French Foreign Minister Georges Bidault '45. Belgium announced also that she would support the French proposals for separation of the Ruhr Valley and the Rhineland from Germany; France had offered to let the Belgian Army take over part of the territory which, it was thought, might be the French zone of post-war occupation of the Rhineland. And in April Spaak headed the nine-man Belgian delegation to the United Nations Conference on International Organization at San Francisco, which included a "former political enemy and now fast friend," the Communist, Albert Marteaux. On his departure Spaak defined the role of the small nations at the conference as "to do nothing to make more difficult an agreement between the great powers and to defend at the same time the essential interests, moral and material, which they represent." At the conference Spaak was chairman of one of the four commissions, that on general provisions. "M. Spaak is becoming one of the important voices in the conference," reported Anne O'Hare McCormick '40. "He is eloquent, active, and conciliatory. He was one of the half-dozen who voted with Russia on [refusing to admit] Argentina, and in the Steering Committee he supports the view of one of the Big Four on this issue and another on that. M. Spaak will be worth watching."

Back in Brussels Spaak addressed the Socialist Party Congress in June, pointing out that the formula of a government of national unity was no longer sufficient. To this he added, "We must find a government in which all members are agreed on structural reforms. I believe that at the present time only socialism is possible. Thousands of people are unconsciously tending toward the socialist solution." The Minister also said that Belgium's food situation was better than that of other liberated countries and that his country would enter an extraordinary period of prosperity if it could solve the coal problem.

On the question of what King Leopold's position in his homeland should be following his liberation from German detention, Spaak spoke in no uncertain terms. He told the Belgian Parliament in July that the King, his former friend, leaned in Hitler's '42 direction as early as 1940 when the monarch pronounced the Allied cause lost, differing radically with the Government. "If Belgium survives today it is because we disobeyed the King at that time," said Spaak. "All those who carried out sabotage during the occupation or worked against the Germans likewise disobeyed the king. Leopold can no longer be accepted as a symbol of unity."

Spaak went to London as Belgian delegate to the Preparatory Commission of the United Nations Organization which opened its sessions on November 25, 1945. Contrary to the opinion of many delegations he was elected second vice-chairman—not chairman of the commission. It was understood, however, that the British delegation headed by Philip J. Noel-Baker was pressing behind the scenes to achieve the election of Spaak as chairman of the General Assembly of the United Nations and that this was an important factor in the election of Dr. Zuleta-Angel of Colombia as chairman. Spaak favored a European site for the United Nations' headquarters, his main argument against choosing the United States for its future home being that the equality of the Big Five would thus be upset. Pleading against the concentration of international life in one country, since most of the other big international organizations had American headquarters, the Belgian Foreign Minister continued: "The placing of the headquarters in Europe would be an act of faith and confidence in the old Continent, which has been stricken by war. It would be a way of bringing her back to life and of showing that you believe in her resurrection to become the balance between the Old World and the New."

Photographs show Paul-Henri Spaak to be a chubby, cherub-faced man, partly bald. He is described as "a brilliant lawyer, an excellent organizer and campaigner, and an eloquent orator," who "considers Marxism obsolete." He is still a better-than-average tennis player.

SPROUL, ROBERT GORDON (sproul) May 22, 1891- University president

Address: h. President's House, University of California, Berkeley, Calif.

"An educational convention on the Pacific Coast without Mr. Sproul would be like a performance of *Hamlet* with the title role omitted. I know of no man whose views in this vital field will present more of interest and challenge to our profession." In 1942 those words, spoken by President William Howard Pillsbury of the American Association of School Administrators, served to introduce to the Association one of the speakers of the day, Robert Gordon Sproul, the president of the University of California, who occupies his high office without benefit of a Doctor's degree (although he has been the recipient of eleven honorary degrees) and who earlier had refused a lucrative bank presidency because he felt that the path of highest service lay in the educational rather than the financial sphere. "To preserve and strengthen higher education in a world of brutal war and revolutionary change," he said in 1943, "may prove, in the long record of time, to have been the most fundamental even of our immediate and urgent necessities."

Robert Gordon Sproul was born in San Francisco on May 22, 1891. His father, Robert Sproul, an auditor of the Southern Pacific Company, was a native of Scotland and a graduate of the University of Glasgow. His mother, Sarah Elizabeth (Moore) Sproul, was a New Englander. Sproul received his B.S. in 1913 from the University of California, where he divided his time between books and athletics. Of his prowess in the latter, the story is told that in 1910, while running his two miles against Stanford on the California oval in a driving rain, he was handed an umbrella by a sympathetic onlooker and came in far ahead of the field holding the umbrella over his head. His record in scholarship is attested by his membership in Phi Beta Kappa. "He began his career," according to the *National Cyclopædia of American Biography*, "in the efficiency department of the city of Oakland, California." But soon thereafter, in 1914, he became cashier of the University of California, thus beginning his long and unbroken association with that university. On September 6, 1916, in Oakland, Robert Sproul was married to Ida Amelia Wittschen, and the next July their first child, Marion Elizabeth, was born. (The Sprouls have two other children, Robert Gordon and John Allan, born, respectively, in 1920 and 1924.)

ROBERT GORDON SPROUL

In 1918 Sproul was made assistant comptroller of the university, advancing in 1920 to comptroller and secretary to the Regents of the university. In 1925, while still retaining his post as comptroller, he was named vice-president. In this dual position Sproul was in one year (1929-30) responsible for expenditures amounting to $15,253,000, of which $4,725,000 went for land, buildings, and improvements. On July 1, 1930, having been comptroller for ten years and comptroller and vice-president for the last five of them, Sproul succeeded William Wallace Campbell in the presidency of the University of California, becoming at the age of thirty-nine one of the country's youngest university presidents and, like Chicago's Robert Hutchins '40, one of the few without a doctorate. On October 22, 1930, the inauguration ceremonies took place amid general acclaim, although, as *Time* put it, some "scholars winced at this raising of administrative talent over learned distinction."

Sproul assumed the presidency at a time when the University of California was both expanding and consolidating, when one of the aims of its administrators was to make it in

SPROUL, ROBERT GORDON—*Continued*

purpose and scope not merely the University of California but of the entire Pacific Coast. The division between the two main centers of the institution, one for the south and one for the north of the state, indicated in the official designations of the University of California at Los Angeles and the parent University of California at Berkeley, was rapidly being supplemented by the six other campuses which complete the eight of the university today. The need was for one university to serve the large and populous state of California, in the words of President Sproul, "on the principle of home rule—autonomous working parts like those of the British Empire, commonwealths working toward a common end." Under President Sproul, who has been described as business executive, politician, and lover of scholarship, the goal was reached, for the University of California is today considered one of the foremost universities, and the foremost state university, in America.

President Sproul conceives of the role of a university in terms of democratic citizenship. "It is the schools," he told the American Association of School Administrators, "which give substance to the ideals of democracy; it is the schools which are most potent in keeping those ideals alive." The objectives towards which university training should be directed, he feels, are: "(1) the laying of a cultural foundation on which one may build a rich, abundant, useful life; (2) the development of civic consciousness and of the capacity to meet the responsibilities of a democratic citizen; and (3) the acquisition of the knowledge and skills essential to vocational and professional success in specific fields." The products of a university should be able leaders and intelligent followers, the mainstays of a democratic republic. In this work the quality of the teacher is of prime importance. "No system of teaching and no curriculum plan is better than the persons who administer it," he said in 1942. "If I had to choose between a model curriculum and teaching procedure administered by a mediocre teacher, and any old kind of curriculum or teaching procedure with an intelligent, highly qualified teacher, I should unhesitatingly take the latter."

Sproul believes that the role of the university is not confined to peacetime, that the universities, in addition to training specialists for the immediate demands of war, have in times of conflict a sacred trust and obligation to preserve and defend "those ideals which are essential to the dignity of the human spirit [which is the center of the arch of democracy]: that men may read and teach the truth unafraid; that even the least of them may have an unsmothered voice in the determination of his destiny; that youth may be trained as free citizens not as janissaries; that the state may exist for men, not men for the state; that honor and decency and justice may prevail." He further points out that the best hope for international cooperation lies in following along paths which the universities have long traveled. "Elsewhere brotherhood may seem an idle and utopian dream," he says, "but in the world-wide fraternity of universities, where scholarship is the password, it has long been an established and accepted fact. . . .Thought never has been successfully nationalized." He envisions the universities in the postwar world to be the beacons which will lead to the realization of the ideals for which the United Nations are fighting.

The university president declares that the present system of "so-called progressive education" has not accomplished this purpose. It has failed, he says, to train disciplined citizens imbued with democratic ideals, has produced instead "helpless victims" of all sorts of "educational dyspepsia and malnutrition", "rampant adolescents" who are undermining "the long-time interests of the race." He predicts that "catastrophe lies ahead" unless the schools return to the "disciplined education of their students . . . as citizens."

Sproul's course as president of the University of California has not always been easy or clear cut. In 1940, for instance, two thousand of his students demonstrated in protest against the draft. That in 1941 they reversed their stand and voted heavily for conscription and aid to Britain, at the same time disbanding the local branch of the allegedly Communist-dominated American Students Union, has been attributed to the influence of President Sproul. At one time when the University was attacked as a Communist-influenced institution, Sproul found it necessary to tour the state to win friends. In 1942, when Sproul, sympathizing with three hundred Nisei students (Americans of Japanese descent) who were to be moved away from the Pacific Coast, asked thirty-two inland colleges to take them, he received only fourteen favorable replies, three of which were afterward withdrawn by the colleges concerned because of the local opposition the idea aroused. As late as 1943 Sproul had to contend with the adverse criticism directed against the Writers' Congress held on his campus, a gathering attackers labeled "communistic." A personal problem involving the University also had to be solved. In 1939 Sproul (whose salary in 1939 was stated to be $13,500 plus expenses) was offered the $50,000-a-year presidency of the Anglo California National Bank of San Francisco, a position he refused when a student demonstration "confirmed [his] belief that being the president of a university is the greatest way to high service." *Time* (March 29, 1939) was of the opinion that Sproul, who is said to have political aspirations (he is a Republican), might have paved the way to governmental office had he accepted the bank presidency.

Sproul has been awarded numerous honors. He is the recipient of eleven honorary Doctor of Laws degrees: from Occidental College, the universities of Southern California and San Francisco, Pomona College, University of Oregon, University of Nebraska, Yale University, University of Maine, University of New Mexico, Harvard University, and Mills College; and he has received the Doctor of Letters degree from Columbia University. In 1934 his own institution gave him the Benjamin Ide Wheeler Distinguished Service Award, and in 1941 he was made an honorary fellow of Stanford University. He has been honored by foreign governments, having been made Chevalier of the Legion of Honor by France in 1932, Commander of the Order of the Crown by

Rumania in 1936, and Knight of the Order of Iron Crown by Italy in 1938.

Because of active concern with civic and social welfare and his wide interests, he has officiated on numerous boards and committees. During the decade of his comptrollership (1920-30), he was general manager of the Bear Gulch Water Company and he served on the California State Committee on Agricultural Education (1921-23), the California State Board of Social Welfare (1928-31), the commission on the revision of the California State Constitution, as director of the Berkeley Chamber of Commerce, and as treasurer of the Save-the-Redwoods League (which post he has held since 1921). At present, in other posts not connected with the University of California, he is a member of the Pan American Trade Association, the president of the American Council of the Institute of Pacific Relations, a trustee of the Carnegie Foundation for the Advancement of Teaching, the Rockefeller Foundation, and the General Education Board, a member of the radio advisory committee of America's Town Meeting of the Air, and vice-president and director of the Berkeley Guarantee Building and Loan Association. His war activities included membership on the advisory committee on the utilization of colleges and universities of the War Manpower Commission, membership on the National Child Refugee Committee and the American Red Cross Advisory Committee, the Joint Army-Navy Board for Training Unit Contracts, the Special Committee of the Veterans Administration, the Board of Visitors to the Naval Academy for 1945, the Naval Academy Centennial Commission, the Northern California Books for Russia Committee, and he served as special consultant to the Office of Scientific Research and Development. In 1945 he was made adviser "on the human aspects of reparations" to Edwin W. Pauley '45 of the Allied Reparations Commission. He is a member of the Committee for Economic Development.

Together with seven other college presidents, Sproul in November 1945 wrote to President Truman requesting that "a system of deferments for college students majoring in science on a quota basis, which was abandoned at the height of the war emergency," be reinstated. Declaring that the United States was the only one of the Allied nations that had adopted a policy of drafting all able-bodied men from universities regardless of the profession for which they were training, the appeal stated that we "face an alarming dearth" of doctors, dentists, trained industrialists and scientists.

Sproul has been described as big, blond, and "booming." He is still an athlete and finds much of his recreation in such sports as hiking, mountain climbing, skiing, tennis, swimming, and fishing. He is popular with his students, and with the residents of Berkeley, who frequently hail him as "Bob" Sproul. His good nature and tact, observers say, have helped him over rough spots with the California State Legislature. Especially well read in history and political science, he enlivens his addresses by his gift for humor. While he has written no books, his many speeches and the few articles he has written have appeared in educational periodicals and in the magazine *Vital Speeches of the Day*. He is a member of the Presbyterian Church. Some of his clubs are the Rotary, Bohemian, Claremount Country, Berkeley Country, and University (of New York).

STANTON, FRANK Mar. 20, 1908- Radio executive

Address: b. Columbia Broadcasting System, 485 Madison Ave., New York City; h. 25 E. 83d St., New York City

In June 1945 Vice-President Frank Stanton of the Columbia Broadcasting System added to his already numerous responsibilities the position of general manager of CBS, to become one of the youngest and best-known major executives in the radio industry in the United States. Recognized as one of the chief authorities in the field of radio research, he rose to his present position through his technical and psychological work in that field.

Frank Stanton was born in Muskegon, Michigan, on March 20, 1908, the elder of two sons of Frank Cooper and Helen Josephine (Schmidt) Stanton. Later the Stantons moved to Dayton, Ohio, where the father became a teacher in the city schools. A graduate of Steele High School of that city, in 1930 young Stanton received his Bachelor's degree from Ohio Wesleyan University, and two years later his Master's degree from Ohio State University. Having been appointed an instructor in the psychology department of Ohio State in 1932, Stanton then combined teaching with study until he received his Ph.D. in psychology from Ohio State in 1935. As part of the work for that degree, Stanton had, in 1934, written for a relatively obscure scholarly journal a paper establishing by means of experimental data "the novel thesis" that aural impressions are more powerful than visual. This paper attracted the attention of Columbia Broadcasting System executives, and the young college instructor was brought to New York to to serve as a consultant to Columbia on listener research. Later, in 1935, Stanton resigned from the faculty of Ohio State University to become a member of the research staff of the radio network.

In 1937 researcher Stanton turned his attention to program analysis and together with Paul F. Lazarsfeld, now director of the Office

FRANK STANTON

of Radio Research of Columbia University, he developed the Stanton-Lazarsfeld Program Analyzer. In testing program reactions with this invention, listeners at the studios, identified only by numbers, are asked to listen to a particular program while holding push button controls in their hands: to push the right-hand, a green, button for preference; the left-hand, a red, for aversion. In this way likes and dislikes are indicated at intervals as the program progresses. "Each button," explains *Time* Magazine, "is electrically connected with a [separate] pen which draws a continuous line on a moving paper tape pulled under it at a constant speed of approximately one inch every five seconds. When a button is pressed an electric magnet jogs the pen a quarter of an inch [so that the reaction is recorded in the relative color], keeping it off the apathy line until the button is released." At the conclusion of the test program, interviewers, working from scripts with time notations, probe for the cause of likes and dislikes both of the entire program and of single numbers and episodes.

In 1938 Stanton was given the position of director of research. Another promotion in 1942, after he had doubled as advertising director for the preceding year, made him one of the youngest vice-presidents of the corporation. Concurrently, from 1937 to 1940, he had been associate director of the Office of Radio Research at Princeton University, and in 1940 he had been appointed a member of the advisory council of the Office of Radio Research at Columbia University. During his years in radio research, in addition to developing the Program Analyzer, he had been the first to develop and use an automatic recording device which can be placed in home radio sets to record accurately the operation of the sets. This project (1931-35) formed the basis of his doctoral dissertation. To Stanton, notes a reporter, radio research was always only "one of many means to an end, an instrument of administration, not a substitute for creative and imaginative thinking."

As an administrative vice-president at CBS, Stanton was responsible for the operation of the research, reference, press information, and sales departments, and of the department of building construction, maintenance, and operations. He also supervised the functioning of Columbia stations WABC and WABC-FM (New York), WBBM and WBBM-FM (Chicago), WCCO (Minneapolis-St. Paul), WEEI (Boston), KMOX (St. Louis), KNX (Los Angeles), and WTOP (Washington). In 1941 his services were requested by the Office of Facts and Figures in Washington, and in 1942 he was made a consultant to the Office of War Information and to the Secretary of War. His promotion to the vice-presidency and general managership of the Columbia Broadcasting System dated from June 4, 1945. He has also been elected a member of the board of directors of the organization.

Besides discharging his regular duties at CBS, Stanton acts as a member of the board of directors of the American Film Center, Inc., the Audio Electronics Company, the Columbia Recording Corporation, and the National Association of Broadcasters, Broadcast Measurement Bureau, Inc., Cooperative Analysis of Broadcasting, Inc.; of the governing committee of the Bureau of Applied Social Research of Columbia University; and of the editorial board of *Sociometry*, and the *Public Opinion Quarterly*. He also holds memberships in the American Psychological Association, the American Statistical Association, the American Marketing Association, and is a member of the Market Research Council, in addition to being a Fellow of the American Association of Applied Psychologists and a member of six Greek-letter fraternities. He contributed sections to *Students' Guide—the Study of Psychology* (1935), and *Experimental Foundations of General Psychology* (1938). In addition, he was co-editor with Lazarsfeld of *Radio Research, 1941,* and *Radio Research, 1942-1943,* and he produced two films: *Some Psychological Reactions to Emotional Stimuli* (1932) and *Factors in Visual Depth Perception* (1936).

Stanton was married on December 31, 1931, while he was a graduate student of psychology at Ohio State University, to Ruth Stephenson. He is a photography enthusiast. One reporter has described him as "big, blond, burly, looking more like a college fullback than the scholar he is."

Who's Who in Commerce and Industry (1944)

STARK, LOUIS May 1, 1888- Journalist

Address: b. c/o New York Times Bureau, Washington, D.C.; h. 1921 Kalorama Rd., Washington, D.C.

Veteran journalist Louis Stark has been the New York *Times* labor news specialist in Washington, D.C., since 1923. Winner of the Pulitzer Prize in journalism and letters for the year 1941, Stark has covered national and international labor affairs during a momentous era of the labor movement. His newspaper career, begun after a brief period in the teaching and publishing fields, covers more than a quarter of a century of news reporting for the *Times.*

Louis Stark, a native of Tibold Daracz, Hungary, was born in 1888 on Europe's Labor Day, May 1, a significant day for a man who was to devote himself to the affairs of labor. A son of Adolph and Rose (Kohn) Stark, the child came with his parents to the United States at the age of three. The family lived in New York City, where Louis attended the public schools and was graduated from De Witt Clinton High School in 1907. During the next two years he studied at the New York Training School for Teachers. Upon completion of this course in 1909 he was given a teaching post at Public School No. 75 in Manhattan. After six months of teaching he left this position to enter the publishing business; for the next year and a half he served as a book agent for a New York publisher.

At the end of this time Stark then turned to the newspaper field, joining the advertising department of the New York *Times* in 1911. While writing advertisements for the *Times,* he also began to take assignments for the New York City News Association. Offered a full-time job by the association late in 1913, Stark accepted, thus beginning his reporting career. During the next few years, a period of struggle and growth within the labor movement, he gained his first experience reporting labor news, including the activities of the I.W.W. (Industrial Workers of the World). In the summer of 1917 Stark left the association to work for the New York *Evening Sun.* After a few months, on October 1, 1917, he gave up this position to transfer once more to the staff of the New York *Times,* where he has remained ever since. The reporter covered varied assignments until 1923, when he began to specialize in economic affairs, particularly labor news and views. In recent years Stark's writing has been entirely devoted to this field.

In the course of his career Stark has covered numerous labor conventions in the United States and abroad, as well as strikes and industrial disputes in different parts of the Nation. He went to Basel, Switzerland, in 1931 to report the proceedings of the World Zionist Convention. During that year his series of articles for the *Times* on the Harlan (Kentucky) coal strike caused considerable comment. In 1933 he was sent to Washington to cover certain aspects of the NRA, and since then most of his work has been done in the Capital. Since the outbreak of the Second World War, Stark has covered almost all of the major industrial issues. He reported the railroad workers' strike threat late in 1943; the activities of the United Mine Workers in January 1944, when they sought readmission to the American Federation of Labor; the important decisions of the War Labor Board; and the International Labor Conference held in Philadelphia in April 1944. On more than one occasion Stark has called attention to the inequalities in the national wage program, noting that the increased earnings of industrial workers are in no way balanced by the almost stationary incomes of unorganized white-collar workers who have had no appreciable income rise.

LOUIS STARK

In September 1944 Stark was present at the United Mine Workers' convention in Cincinnati, reporting fiery sessions involving intra-union disputes. In addition, the convention was stirred by violent political differences, heightened by the approaching Presidential election. Stark's dispatches from the scene revealed the attack on President Roosevelt ['42] by an opposition group led by John L. Lewis ['42]. January 1945 found the journalist in London attending the sessions of three international organizations. First, he reported the meetings of the governing body of the International Labor Office, at which Robert J. Watt ['45] represented the United States. Then, on February 1, Stark was present at the opening of the International Federation of Trade Unions, a meeting marked by a bitter attack by the French delegates on the organization's inactivity during the war. A week later the reporter was covering the proceedings of the World Trade Union Conference. His dispatches in the *Times* detailed the conference's stormy sessions on the question of admission of delegates from former enemy countries. While in London Stark also took part in a radio program, the *BBC Guest Book,* heard in America over station WQXR.

Stark's widely published articles have appeared in such publications as the *Atlantic Monthly,* the *Yale Review, Current History,* and the *Nation's Business.* Throughout the depression period his work bore the mark of the crisis with such titles as "All I Want Is Work", "Old at Forty," and "Sit-Down Strikes." Discussing the question "Are Labor Unions Destructive?" in the *Outlook* in 1930, Stark said that while no labor organization is utopian, the features of many point to increasing harmony between the employer and the wage earner. The labor analyst covered "The Crisis in the Labor Movement" in the *New Republic* (March 25, 1936), discussing the formation of the CIO and its ensuing struggle with the A.F. of L. This same theme was more fully developed in "Your Stake in Labor's War," which appeared in *Nation's*

STARK, LOUIS—*Continued*

Business in February 1938. The *Survey Graphic* of November 1941 carried the journalist's article "Tares in the Wheat," described as an analysis of "subversive activities by Nazi and Communist sympathizers behind the union front," an article confined almost entirely to a discussion of Communist activity within the labor movement.

In January 1942 Stark's essay on "The Press and Labor News" appeared in the *Annals of the American Academy of Political and Social Science.* Treating the subject in historical perspective, the writer traced the attitude of the press toward labor from the earliest days of American trade unions to the present, when labor is front-page news. First, with the passage of the NIRA, and later, with the Wagner ['41] act and the NLRB, labor came into the headlines. "Today," wrote Stark, "labor news has come into its own as a feature of American newspaper coverage." Regarding the future of labor news, the *Times* correspondent declared, "So long as freedom of the press in the United States remains one of the Four Freedoms, and democratic institutions prevail, the men and women who work . . . and join unions of their own choosing will make front-page news, because their organizations are participating more and more in vital decisions of national policy."

Stark was one of thirteen *Times* correspondents who collaborated on the book *We Saw It Happen: the News Behind the News That's Fit To Print* (1938). The chapter written by the labor reporter, called "A Case That Rocked the World," dealt with the Sacco-Vanzetti case, one of the most famous issues in the annals of labor. Stark had previously written on this case; his article in *Survey* (October 1927), "The Grounds for Doubt," was based on his coverage of the controversial case in Boston during the three weeks before the execution of Sacco and Vanzetti, political radicals accused of murder and theft. Another article in the July 1943 issue of *Survey Graphic,* entitled "What's the Matter With Labor?" offered an extensive evaluation of the labor scene since the Japanese attack on Pearl Harbor, ending on a note of warning against inflation.

The reporter's writings in the *Times* have included several feature articles in the magazine section of that paper on his special field and related subjects. He has devoted articles to prominent personalities such as William H. Davis ['41], "Labor Catalyst," John G. Winant ['41], "A New Kind of Envoy to a New Kind of Britain," and "The Militant Mr. Lewis," the U.M.W.'s president. In July 1944 Stark wrote a series dealing with manpower and production conditions in the foundry industry, a detailed study which involved various Government agencies. In July and August of that year the *Times* also carried his series on the role of the CIO in American politics. Calling political action "something new in American political life," Stark discussed Chairman Sidney Hillman's ['40] views and activities and presented criticism of PAC from various sources. Another article on labor's campaign role weighed the issues and found PAC emerging as a potent political force. Considering labor's stake in the election, Stark stated, "While the Roosevelt Administration has not been a 'labor government' in the British sense of that term, it has nevertheless been as close to a labor government as any this Nation has ever had."

Stark stated his views on the cause and cure of industrial unrest in general and, specifically, in relation to the crucial period of reconversion following the cessation of hostilities in an article written for the New York *Times Magazine* on September 30, 1945. "The basic cause of what are usually called 'labor troubles,' but which may also be classed as 'management troubles,' are economic, social and psychological. . . .The economic system under which we live stresses profits, prices and wages. These factors are in disequilibrium. . . .Workmen, when they find their income inadequate to keep their families in comfort and decency, will fight the employer who seeks to reduce wages. . . .Feeling confused and helpless, the workman looks about and finds that 'in union there is strength.' . . .Nevertheless, there are still social troglodytes who see in unions a menace, a snare, and delusion. . . .Our frontier heritage of violence has not disappeared. The picket line disturbance is the firing line on the industrial battlefield. . . .No single employer or industry can cope with these kaleidoscopic transformations. Therefore social legislation is indicated. . . . On the organizational side, both management and labor may improve their relations by establishing methods of cooperation that will eliminate many of the recurring frictions. . . .The Government itself should be responsible for improving its conciliation machinery. Since . . . [the adoption of the National Labor Relations Act] the Government has done little to complete the structure, for the Nation still lacks a rounded-out national labor policy. . . .Legislation, however, would be futile if it embraced compulsory arbitration, since neither labor, industry, nor the public desire such drastic control. . . .It is to be hoped that Congress may enact whatever minimum legislation may be necessary during this early reconversion period and not defer action until the Nation's industries are geared to full production. . . .Finally, when one is tempted to despair over the recurrence of industrial disputes, it may be well to remember that the right to strike, the right of employers and employees to disagree, is in essence a guaranty of the democratic freedoms which we cherish. But the possession of such rights does not mean license to use them irresponsibly . . . to interfere with the common good."

Subject to criticism, like most journalists, Stark has come in for his share of bouquets and brickbats. He has been variously charged with distortion and partiality in the reporting of labor news. However, fellow newspapermen have pointed to his knowledge and integrity. When Stark won the Pulitzer Prize in 1942 colleague James A. Wechsler of *PM* paid tribute to him in the *Guild Reporter,* the official organ of the American Newspaper Guild. Wechsler said of Stark: "There are few reporters as universally respected by all sides. . . .All of us who cover labor owe him much, if only because it was largely through his work that news of labor unions became page-one news." Once described by the editors of *Current History* as "fair, honest, and objective," this observer of the labor scene is generally considered a distinguished authority in the industrial field.

The gray-haired journalist is five feet five inches tall and weighs one hundred and forty-eight pounds. His wife is the former Jennie House, to whom he was married on August 17, 1916; they have one son, Arthur. The politically independent newspaperman lives in Washington, D.C., where he is a member of the National Press Club. In 1937 Stark was awarded an honorary Doctor of Laws degree from Reed College in Portland, Oregon, with a citation which said in part: "Never seeking publicity for himself, he has brought distinction to a great newspaper by living up to his ideal of searching for and presenting the whole truth."

STRAUSS, ANNA LORD Sept. 20, 1899- Civic leader

Address: b. National League of Women Voters, 726 Jackson Pl., N.W., Washington, D.C.; h. 2500 Q St., N.W., Washington, D.C.

Among the most influential women's organizations in the United States is the National League of Women Voters, whose president, Anna Lord Strauss, has devoted many years to civic work. In her capacity as leader of some sixty thousand American women, Miss Strauss plays a prominent role in nonpartisan American politics. She rose to head the League after six years of service as president of the New York City branch of the organization. Her active career has included national and state government posts in addition to literary and personnel work.

Anna Lord Strauss was born in New York City on September 20, 1899. Through her mother, Lucretia Mott (Lord) Strauss, she traces her ancestry back to America's pioneer feminist, the Quaker Lucretia Mott. Her father, Albert Strauss, began work as an errand boy and eventually became a partner in a banking house, his wealth enabling his daughter to devote much time to volunteer civic work. Miss Strauss was educated at the Horace Mann School and attended Miss Marshall's classes in New York City. She was interested in sports as a girl, she explains, partly because she had two brilliant sisters and could "shine better that way than in any other activity."

When she was ready to enter college America was in the First World War and she therefore decided to take a secretarial course. After completing her studies at the New York School for Secretaries, she was employed by Government agencies during the remainder of the war. She served in a secretarial capacity in the New York office of the Federal Reserve Board in 1918, and in that year also worked for the United States Shipping Board. In 1919 Miss Strauss was employed by the War Trade Board and then worked in the State Department. When her father went to the peace conference as a financial adviser, she accompanied him on the European mission.

In 1923 Miss Strauss began a six-year literary adventure which brought her from the position of office secretary to that of managing editor of the *Century*. (She also edited a children's book on ships.) Her next position was as librarian for the Employment Service of the New York Department of Labor, from 1931 to 1933. Then followed a year of service as consumer representative on the New York City Compliance Board of the NRA. In 1934 she became a member of the board of directors of the National League of Women Voters, and three years later was elected president of the New York City division. Under her leadership this group was conspicuously active in the field of voters' education and in various local campaigns. Working for county reform, the League sought to have the five county sheriffs replaced by one such officer for the city and to have him appointed by civil service examination; and they similarly sought to have the four county registers replaced by one. Supporters of the campaign for county reform included Mayor La Guardia '40 and many civic organizations. In an interview in 1941 Miss Strauss described the existing county situation as "political patronage of the most blatant sort," and at the same time pointed out that "each citizen must learn his power and, having learned, must participate." The campaign for county reform resulted in a "notable victory" in 1941, following which the reform leader was made Special Civil Service Examiner for the Office of Register for the City of New York.

Two years later, in 1943, Miss Strauss, after having served several terms as head of the New York City group, retired for the summer to rest on her Connecticut farm. But America was again at war, and in the fall she accepted a position at the Chance Vought division of the United Aircraft Corporation in Stratford. Here she was engaged in personnel work, which largely concerned the problem of absenteeism. However, she was soon called back to League duties, for, at the Chicago convention in April 1944, the National League of Women Voters elected her president by a vote of 269 to 120, rejecting the official candidate of the nominating committee in favor of the

Harris & Ewing

ANNA LORD STRAUSS

New York woman. At this convention the delegates also adopted a broad program: On the legislative front they favored Federal aid to education, to be administered through state departments of education; they pledged support of the preservation of civil liberties and protection of minority groups against discrimination. On the question of foreign policy, they supported United States participation in international relief and rehabilitation, and membership in an international organization to prevent aggression. Dorothea Kahn pointed out in the *Christian Science Monitor* that the League's recognition of the need for the use of military and economic force to maintain peace was a new position for the organization. The convention also voted to press for a constitutional amendment to change Senate procedure on treaty ratification to a more democratic method.

The League of which Miss Strauss became head had been organized at the victory convention of the National American Suffrage Association in 1920 "to finish the fight by teaching women to wield ballots wisely." Professor Bessie Louise Pierce, in a survey of women's organizations in the *Annals of the American Academy of Political and Social Science* for May 1935, concluded that the League is "a force with which lawmakers reckon." Consisting of six hundred local units in thirty-five states, with headquarters in the Nation's Capital, the League is reported to be "a much greater factor in national affairs than its membership figures [sixty thousand] suggest." According to Volta Torrey, in an article in *Liberty* (September 2, 1944), "Some members wear mink, and some wear shoddy coats. But most of them are public-spirited, middle-class housewives and business and professional women who often are the molders of public opinion." This writer also states that many of the leagues of the major cities are "the most reliable and least partisan sources of information available to a citizen." Several prominent women politicians are said to have "learned the ropes" in the League, among them Eleanor Roosevelt '40, who credits it with having taught her much about her country and her government. While the organization does not discourage partisanship, it considers its own job beyond the realm of party politics. It sets for itself the task of explaining government and political questions and encouraging people to "become active participants in government."

In a *Reader's Digest* article (July 1940) entitled "Women Voters on the Job," Stanley High wrote, "Primarily, what the League stands for is digging up facts. . . .I doubt whether any organization in America is so effective a force for good government." Trying to present all sides of issues, the League is active the year round, especially at election time. Its reports on candidates and issues, based on extensive research, personal interviews, and questionnaires, are widely used. In 1945 the League's publications included the pamphlets "The Story of Dumbarton Oaks", "The Story of Bretton Woods," and a study of the United Nations Charter. One of its pamphlets reminded the reader: "Your time and thought, your considered convictions, your discussion of the problems of peace with others, and your letters to those responsible for the acts of our government, are all essential to winning the peace." In early 1945 the women's group initiated its drive to promote support of United States participation in the United Nations security organization, an undertaking endorsed by the Secretary of State, Edward R. Stettinius '40. On the twenty-fifth anniversary of the League Miss Strauss spoke of the contributions of women's groups to the cause of world peace. (Other speakers included Senators Tom Connally '41 and Harold Burton '45.)

The League president endorsed the reciprocal trade agreement bill when the Administration measure was being considered by the Senate Banking Committee in June 1945. In July Miss Strauss testified on the United Nations Charter before the Senate Foreign Relations Committee, and urged the Senate to "proceed with all possible speed" to ratify the Charter. The following month she was one of several women leaders who visited President Truman '45 to voice their support of the Pepper '41-Morse '42 "equal pay for equal work" bill. Again in September she met with other leaders of women's groups who had sent consultants to the United Nations conference, to consider "how the representation so effectively done at San Francisco can be carried on." Later that month the head of the League appeared before the Senate Foreign Relations Committee to voice her views on the Senate's treaty ratification power. Critical of the existing method, she said that some Senators "automatically vote against a treaty presented by the opposite party regardless of the merits of the treaty." This remark drew a sharp rebuke from Chairman Tom Connally. In October the President appointed Miss Strauss a member of the United States delegation to the first session of the Conference of the Food and Agriculture Organization of the United Nations at Quebec, Canada.

Anna Lord Strauss once told a reporter that she was shy, but added that "the individual can forget herself in the necessity of persuading others." An attractive brown-eyed, gray-haired woman, she is five feet five inches tall, weighs one hundred and thirty pounds, and, it is reported, "obvious physical fitness gives her a youthful appearance." One of the first women to sail her own racing boats on Long Island Sound, she has represented her native city in squash matches and has figure-skated in New York Skating Club carnivals. She likes to read biography, history, and government. She also enjoys traveling and has seen much of her own country, Central and South America, and Europe. Her Quaker heritage shows itself strongly and, according to one writer, "She and her sisters use 'thee' and 'thou' to one another, even though she has found harder pronouns more effective in politics." Not domestically inclined, when asked what dish she prefers she replies, "The nearest." Miss Strauss is a trustee of Connecticut College, and her clubs include Cosmopolitan, Town Hall, and the Women's City Club of New York. The executive rarely goes to the theater or professional games, for, she says, "I'd rather do things than watch them."

SULTAN, DANIEL I(SOM) Dec. 9, 1885- United States Army officer

Address: b. c/o War Department, Washington, D. C.

U. S. Army

LT. GEN. DANIEL I. SULTAN

The first Army man to receive four Distinguished Service Medals, Lieutenant General Daniel I. Sultan was originally known as a United States Army Engineer in the Philippines, Nicaragua, and continental United States. In November 1944 he was appointed commander of the strategic India-Burma theater of operations and on August 14, 1945, was awarded the third Oak Leaf Cluster to the D.M.C. for "exceptionally meritorious and distinguished service as commander of the United States forces in the India-Burma theater." His promotion to Inspector General of the Army preceded this honor: President Truman '45 nominated him to that office on July 9.

Born Daniel Isom Sultan on December 9, 1885, in Oxford, Mississippi, he is the son of Daniel Isom and Emma Linda (Wohlleben) Sultan. His Southern drawl betrays his birthplace, but he has not been back there, except to visit, since he left the University of Mississippi. His appointment to the United States Military Academy came while he was still studying at the university (1901-3), and he left before graduation to enter the Point. While there he played football, and was chosen an all-American center. Upon his graduation in June 1907 he received a commission as a second lieutenant in the Engineer Corps.

After serving for a year at Fort Leavenworth, Kansas, with the Third Battalion of Engineers, young Lieutenant Sultan was ordered to Washington Barracks (now Fort Humphreys) in the District of Columbia, where he remained until 1912. During this period he attended the Engineers School at the post, and upon graduation was made a first lieutenant. He was next stationed at West Point, as an instructor in the department of engineering. He remained in that post from 1912 until 1916 and during that time, in February 1914, was advanced to the rank of captain. In September 1916 he left the Academy for the Philippine Islands, where he served successively with the Engineer troops as the officer in charge of construction and maintenance of fortifications on Corregidor and Caballo islands in the Philippine group; and as engineer of the Philippine Department in charge of all fortification work in the Islands. With the entrance of the United States into the war in April 1917, the thirty-

SULTAN, DANIEL I.—*Continued*

one-year-old engineer was advanced rapidly, in May to the rank of major, and in August to the temporary rank of lieutenant colonel.

From March 1918 to June 1919 Sultan served in Washington, D.C., on the War Department General Staff. In July 1918, he was again advanced, to the temporary rank of colonel. Then in 1919 he was ordered overseas for duty on the General Staff of the American Expeditionary Forces in France. But in August of the same year he returned to the United States for further duty with the War Department General Staff in Washington, where he remained until the summer of 1922. For his work with commissioned personnel under the Chief of Staff during the World War and the demobilization period, Colonel Sultan was awarded the Distinguished Service Medal. The citation reads: "His work was characterized by conspicuous breadth of vision and keen foresight. His splendid judgment and the sound policies initiated by him contributed in a large measure to the successful handling of the commissioned personnel of the Army. He rendered service of signal worth to the Government in a position of great responsibility." In March 1920 he reverted to his permanent rank of major.

When his duties with the General Staff had ended in 1922 Major Sultan returned to Fort Leavenworth, where he had served before the war, to attend the Command and General Staff School there. He was graduated in 1923 and was assigned, as district engineer, to Savannah, Georgia, where he remained until August 1925, supervising river and harbor improvements and fortifications in the district. When the assignment was completed he entered the Army War College in Washington, from which he was graduated in 1926. He remained in the Capital until August 1929, however, as resident member of the Board of Engineers for Rivers and Harbors.

Sultan's next assignment took him to Nicaragua, where he remained for two years. While there he was in charge of the interoceanic canal survey and in command of United States Army troops in the Central American country. On October 1, 1930, he was advanced to the rank of lieutenant colonel. During the Nicaraguan earthquake in March 1931 he was in charge of the Army's relief activities, and for this he was awarded the Oak Leaf Cluster. The citation for this award reads: "For exceptionally meritorious and distinguished services. While serving as commanding officer of United States Army troops in Nicaragua, Colonel Sultan conducted an investigation of the interoceanic canal route with efficiency and maintained high morale among his troops under conditions of unusual hardship and difficulty. By his tact and diplomacy in handling intricate problems he maintained cordial relations with the people of Nicaragua. Following the disastrous earthquake in Nicaragua in March 1931 Colonel Sultan by his prompt and effective relief work evoked the appreciation and gratitude of the afflicted people. In the performance of these duties, he demonstrated marked ability, sound judgment, and untiring zeal in a position of great responsibility, thereby rendering services of great value to his Government." The Nicaraguan Government also presented him with its Presidential Medal of Merit and Congressional Medal of Distinction.

Sultan returned to Washington after his Nicaraguan assignment and was assigned to duty in the Capital, from July 1931 to January 1932, with the Interoceanic Canal Board in the Office of the Chief of Engineers. After this he was ordered to Chicago as district engineer. He remained in this post until the summer of 1934, when he was reassigned to the District of Columbia, this time as engineering commissioner. In October 1935 he was advanced to the rank of colonel.

In August 1938 Colonel Sultan was transferred to Fort Logan, Colorado, to command the Second Engineers, and on his advancement to brigadier general in December assumed command of the Fort. He was relieved of this command in June of the following year and assigned to command the Twenty-second Infantry Brigade at Schofield Barracks, Hawaii, where he stayed until April 1941. During the last month he was commanding general of the Hawaiian Division, and in April, just before he left the Islands, his rank was advanced to major general (temporary). He was then named to command the Thirty-eighth Division at Camp Shelby, Mississippi. This post he held from May 1, 1941, through the entrance of the United States into the Second World War, until April 6 of the following year. *Time* Magazine characterized this appointment as a "small but hopeful sign that the United States Army might be on the way to getting tough—tough enough to face modern military competition." Sultan, it is said, was the first Regular Army officer to replace the National Guard commander of a Guard division after the start of the war. He subsequently became commanding general of the Eighth Army Corps (later redesignated the Eighth Corps), serving in this capacity until November 1943, when he was made deputy commander in chief of the China-Burma-India theater of operations under General Joseph Stilwell. In September he was made lieutenant general (temporary).

Upon General Stilwell's recall in October 1944 this Far Eastern theater of operations was divided into two sectors—one to be known as the China area, now commanded by Major General Albert C. Wedemeyer '45; the other the India and Burma area, under Sultan. On assuming command Sultan told the American troops that the recent events, such as the recall of General Stilwell, had changed "neither our mission, nor our strategy. . . .Our job is to open the Burma Road so heavy equipment . . . can be gotten to the Fourteenth Air Force, so that artillery may be gotten to the Chinese armies. . . .This Chinese Army," he continued, "has tied up numerous Japanese divisions which could have been used and could still be used against our forces in the Pacific."

The General took official command of the Chinese armies in Burma on November 12, 1944, under direct deputization from Generalissimo Chiang Kai-shek '40. This northern combat group included the Chinese First Army, the Chinese Sixth Army, the British Thirty-sixth Division, and what General Sultan described at a press conference as a "considerable force" of Americans. Within a short time after assuming his command Sultan saw his troops inflict ten-to-one casualties on the Japanese, but the General declared, "I have seen no indication that the Japanese intend to give up Burma."

Nevertheless, in early December it was announced that more Allied supplies were flowing into Burma than ever before—more than twice as much as a year before. Chinese-American and British troops pushed deep into Burma and during a ten-week campaign won half as much territory as Allied forces were able to take from the enemy throughout the previous year. By the end of the month Sultan's combat area command in Burma announced that Chinese troops had crossed the border into their own country. The loss of the Burma Road, closed by the Japanese capture of Lashio in Burma in April 1942, was not remedied until the road-building and counter offensive campaign by the Chinese, American, and British forces were finally completed on January 28, 1945, when the first convoy of American supplies rolled into Wantung, on the border of China. Honoring "Vinegar Joe," Generalissimo Chiang Kai-shek named the new Ledo-Burma highway "Stilwell Road." The road partially relieved the Air Forces of the task of carrying gasoline and trucks over "the hump" to China; and bulldozers, graders, and other heavy equipment that could not be sent by air, could now reach China. Lashio itself was captured in March by the American-trained Chinese First Army troops under Sultan, who remained in command until July 1945, when he was appointed Inspector General of the Army. On August 14 he was signally honored by a third Oak Cluster to his Distinguished Service Medal—the first time an Army man had received four such medals. The *United States Government Manual* defines Sultan's Washington post: "The Inspector General assists the Chief of Staff in keeping the Secretary of War informed as to the state of the Army and makes such inspections, investigations, and reports dealing with the efficiency and economy of the Army as may be prescribed by law or directed . . . or requested" by specified officials or officers.

In 1916 Daniel Sultan was married to Florence Bracen. He has two daughters and one stepdaughter. (Two of them are married to Army officers.) The General is a member of the American Society of Engineers, Sigma Chi, the Army and Navy, and the Washington Army and Navy Country clubs. He is fond of mystery stories and is an ardent admirer of the fictional Chinese detective, Charlie Chan.

Who's Who in America, 1944-45

SUMNER, JESSIE United States Representative from Illinois; lawyer

Address: b. House of Representatives Old Office Bldg., Washington, D. C.; h. Milford, Ill.; Mayflower Hotel, Washington, D. C.

JESSIE SUMNER

One of the most thoroughgoing anti-Administration legislators in the United States Congress is Jessie Sumner of Illinois, who was re-elected in November 1944 for her fourth term. The only woman Representative to be found at the extreme Right, she has been a consistent opponent of the New Deal, Great Britain, Russia, the war and the conduct of the war, and home front Administration measures.

Jessie Sumner was born in the little town of Milford, Illinois, eighty-eight miles south of Chicago. Her parents were A. T. and Elizabeth (Gillan) Sumner. Her pioneer grandfather had acquired thousands of acres of rich corn land; her father founded the Sumner National Bank at Sheldon, Illinois. (Today Miss Sumner is a large landowner and a director of the bank.) After her graduation from a private school in 1916, Jessie attended Smith College, where she studied economics under her future colleague, Chase Going Woodhouse '45, receiving her diploma in 1920, and then went on to study law at the University of Chicago. One of the first American women to take law at Oxford University, Miss Sumner spent two terms there, acquiring a British manner of speech which remained long after her return to the Middle West. (When she first ran for Congress the press associations referred to her as "the old Oxonian" and pointed out that, if elected, she would be the first Midwestern Representative with a British accent. In 1943, Jack Steele pointed out in the New York *Herald Tribune*, the Chicago *Tribune* published lists of Rhodes scholars and other Americans educated at Oxford, whose loyalty to the United States was therefore questionable; the lists, he reported, did not include Miss Sumner's name.) Continuing her study, she attended Columbia University Law School in New York, the New York University School of Commerce, and the University of Wisconsin summer school.

In 1923 Miss Sumner was admitted to the Illinois bar and practiced in Chicago; she joined the Chicago Bar Association, the Illinois Women's Bar Association, and the National Women Lawyers' Association, as well as the Business and Professional Women's Club,

SUMNER, JESSIE—*Continued*

the National Women's Republican Club, and the National Federation of Women's Clubs. Miss Sumner is also a member of the Farm Bureau, and manager of the South Side (Chicago) Legal Bureau; she belongs to two Greek-letter societies and the Order of the Eastern Star, and she is a member of the Methodist Church.

During the boom years of 1928-29 Jessie Sumner was employed by the Chase National Bank of New York; in the depression year of 1932 she returned to Milford and took up the practice of law there. Then melodrama entered the picture: her brother was kidnapped by bank robbers. Miss Sumner was active in securing their conviction, and was inspired to run for State's attorney. She was, however, defeated in the Republican primary election. When her uncle the county judge died in 1937, she was elected to fill out his term. The first woman judge in Illinois, Judge Sumner was most cooperative with the gentlemen from the Chicago press, who soon gave her a reputation as a wit.

Miss Sumner's judicial county was one of six (Clark, Cumberland, Edgar, Iroquois, Kankakee, and Vermilion) stretched out along the Indiana border and forming the Eighteenth Illinois Congressional District. A normally Republican area, the Eighteenth was represented at the time by a Democrat, James Meeks, an ailing old gentleman who was said to be late even for his own campaign rallies. Miss Sumner announced that she would run against him in 1938, and then, after some well-publicized indecision, did so, winning the election with an anti-New Deal platform by 56,587 votes to 45,691.

Entering the Seventy-sixth Congress as Illinois' youngest female Representative, Congressman Sumner was placed on the Banking and Currency Committee (the same assignment as her predecessor), for which she was qualified by her banking and legal experience. Amy Porter of *Collier's* says that the Representative has offered "to-the-point amendments" to such bills as the Commodity Credit Corporation and Little Business acts. At a 1941 hearing, however, Miss Sumner expressed surprise on hearing that the WPA had retained consulting economists, and said she saw no reason why WPA should have any.

About one thing there was no doubt, however; that was Representative Sumner's condemnation of "Papa Roosevelt," as she called the President, and of his policies. She is an isolationist and Anglophobe who believed that the United States could and should refuse to expend blood and treasure in the recurrent wars of a quarrelsome Old World. At the time of her election isolationism was still the majority sentiment; radicals and conservatives alike demanded that America stay out of war. "As the rise of Hitler '42 and the truculence of Japan presaged new wars;" in the words of historian Allan Nevins, "the obsessing idea of the American public was to stay out. . . .The Neutrality Act of 1937 registered the high-water mark of isolationist power and sentiment in the United States."

Jessie Sumner was with the majority when, as a freshman in Congress, she helped defeat the proposed improvement of Guam Harbor in February 1939; but the public opinion shifted in response to outside events, and after the beginning of the Second World War she was in a minority as she voted against lifting the arms embargo in favor of cash-and-carry, against expanding the Navy, and against making international reciprocal trade agreements. In 1940, after the fall of France, Holland, and Belgium, when the United States was already committed to an effective defense alliance with Canada, the Illinois Representative demanded of the House, "What reason have you to think that that [defense] program, begun only a month or two ago, will be any less extravagantly administered than the tragic, futile efforts at [economic] recovery? Look at what that outfit in Germany has done and is doing to build up a strong, efficient, trained military force—an outfit which has never wasted a dollar or a pint of oil, or even a pat of butter!" In the light of this belief, she voted against the Burke '40-Wadsworth '43 Selective Service bill for military training.

Miss Sumner returned to Illinois for the 1940 campaign, in which she continued to have the backing of Colonel Robert McCormick's '42 isolationist, strongly anti-British and anti-Roosevelt Chicago *Tribune*. Winning again over her 1938 opponent (by a vote of 64,409 to 56,744) on the Willkie '40 ticket, she began her second term by opposing Lend-Lease and then attempting to cut out the appropriation to support it, and she voted against the arming of merchant ships, which were then being attacked by the Nazis.

On August 12, 1941, Miss Sumner voted against extending the Selective Service System another year. In explanation of her opposing vote, the Illinois Representative said she was "just against war," as a woman. "She says," reported one interviewer, "that she thought long ago that, if a committee had been sent to see Hitler '42 at the right time, all of this trouble might have been avoided." With the United States in the war, Miss Sumner voiced her criticism of military operations, the allies of the United States, the President, and wartime Federal bureaus. Upon the expiration of her term, her Illinois district returned her for a third term in November 1942.

The following January, stating that "New Dealers have been sending up so many trial balloons concerning peace plans that they have created a balloon barrage which prevents rather than facilitates our penetrating their designs," Congressman Sumner introduced a resolution to appoint a special committee of the House to "investigate the cause and prevention of wars likely to involve the United States," and to investigate and recommend peace offers. That February Miss Sumner joined the House's other women legislators in demanding of the Appropriations Committee how women could be expected to work in war factories unless care were provided for their children—an instance in which the few gentlewomen of Congress acted as a bloc. Usually they split along party lines and on the basis of individual beliefs, ranging from Miss Sumner's militant Republicanism to Representative Mary T. Norton's '44 strong support of the Administration. It was also one of the few occasions when the Illinois Representative was in agreement with House liberals.

Another such occasion arose in March 1943, when Miss Sumner and Clare Boothe Luce '42 were two of the twenty-eight Republicans who helped defeat the Ruml '43-Carlson plan for "pay-as-you-earn" taxes, brought up to a current basis by "forgiving" one year's taxes. (One hundred twenty-eight Republicans voted "Aye.") "I feel," said Miss Sumner, "that it is absolutely New Dealish. . . .We are giving a Christmas present to those remaining at home at the cost of our soldiers overseas and those soldiers' children." In May she again helped defeat it, 206 to 202, and later voted the same way on a similar bill passed by the Senate.

During the four-hour argument over the Fulbright '43 resolution in September 1943, Jessie Sumner opposed it vigorously, calling it a "Machiavellian" scheme to make permanent the policy of "handouts across the sea." She charged further that British influences were trying to oust General George Marshall '40 from his post as Chief of Staff and have him sent to a field command "because he stands up for American rights. . . .For the same reason," she claimed, "they keep General MacArthur '41 from heading our warfront." This information she had on "the right kind of authority." In spite of her condemnation of the fifty-four-word Fulbright resolution as "the most dangerous bill ever presented to an American Congress," the House declared itself overwhelmingly, 360 to 29, as "favoring the creation of appropriate international machinery with power adequate to establish and maintain a just and lasting peace among the nations of the world, and as favoring participation of the United States therein, through constitutional processes."

A meeting of four thousand Poles and Polish-Americans in New York on the twenty-fifth anniversary of the Republic of Poland applauded Miss Sumner when she called the Churchill '42-Stalin '42 Moscow meeting "another Munich—only worse." She quoted unidentified "Washington officials" as saying that Stalin was more to be feared than Hitler, "because Hitler is already doomed to defeat by overwhelming Allied forces, while Stalin will rule Europe after his own fashion, with his rule guaranteed by the new Allied organization." And in December 1943 her suggestion that the foreign policy of Latin American nations was influenced by financial considerations brought immediate reaction in Buenos Aires, where the extreme Rightist, "anti-Yanqui" newspapers, such as the *Pampero* and *Cabildo*, played it up as a blow at the Good Neighbor Policy, and the democratic-minded *Prensa* protested.

In January 1944 Miss Sumner spoke against funds for UNRRA, and warned that Stalin will become "a successor to Hitler," backed, it might be, by UNRRA funds. She was against the bill for a soldier ballot; early in March she reversed her position on child care and was then the only woman voting for a drastic cut in its funds. In April she was one of twenty-one Representatives, nineteen of them Middle West Republicans, opposing the extension of Lend-Lease for another year; in June she voted for a bill to free insurance firms from the provisions of the antitrust laws; in September she helped defeat the demobilization bill, which included unemployment compensation for wartime Government and war plant workers. But the high point in her isolationism had been reached in the spring, when Congressman Sumner demanded Congressional action to postpone the imminent invasion of Europe. "The difference between these two ambitious tyrants [Hitler and Stalin] is not worth the life of a single American boy!" she declared. A month later she reiterated that if the invasion "comes as scheduled, it is premature," explaining that "the Luftwaffe has not yet been destroyed." She therefore introduced two bills, one to postpone the invasion ("many of our keenest military experts," she declared, "call this invasion costly and stupid"), and the other to provide that "all of the American land, sea, and air forces now being employed in the war against Japan shall be coordinated" under General MacArthur, who was to receive whatever forces and equipment he might request.

In 1945 Miss Sumner continued to oppose Administration measures, even voting in committee to forbid the President the power to reorganize the Executive agencies. In May she attempted to block the reciprocal trade treaty bill; in March she denounced the United Nations Charter as leading to a "world superstate"; and in June she was one of the eighteen Republicans who alone voted against participation in the Bretton Woods World Bank and World Fund. She was not able, however, to muster more than twenty-nine votes for, to 328 against, her proposal to join only the Bank and not the Fund—a procedure impossible under the terms of the agreement. That month she also opposed the tax-free twenty-five-hundred-dollar expense account the House voted its members; she voted for consideration of the anti-poll-tax bill, but against the bill itself, and also against the extension of price control. In December the Illinois Congressman voted for repeal of the Smith '43-Connally '41 Act in favor of more stringent controls on labor, and later that month she was one of fourteen Republicans and one Progressive to vote against American participation in the United Nations organization, which she attacked as "the new plunderbund." "We have joined the dance of death on the European and Asiatic battlefields," she said when the act passed by 344 to 15.

Jessie Sumner, according to Delos Lovelace, is popular with her fellow Representatives, who like her breeziness and quote her quips. Blue-eyed and blond, she wears her hair short and has a ready smile—even for the photographer who catches her under the hair drier. Miss Sumner, who is judged to be in her forties, has never married. "If a woman has neither husband nor children," she has said, "she wants to do something to serve her generation."

SURLES, ALEXANDER D(AY) Aug. 14, 1886- United States Army officer

Address: b. c/o The Adjutant General, War Department, Washington, D.C.; h. 1870 Wyoming St., N.W., Washington, D.C.

War Department relations with Congress and the public, and information and education for the troops, the responsibility of Major General Alexander D. Surles, who served as head of the War Department Bureau of Public Relations from August 1941 to September 1945, made him the supreme court of appeal on American military censorship. As might be expected, this resulted in much criticism from some newspapers on specific points, but it also brought praise for his fairness and honesty.

U.S. Army Signal Corps

MAJ. GEN. ALEXANDER D. SURLES

Alexander Day Surles was born in Milwaukee, Wisconsin, on August 14, 1886. His parents were William Henry Surles, a life insurance man, and Caroline (Pascoe) Surles. After studying at the University of Michigan in 1906-7, young Surles received an appointment to the United States Military Academy from Wisconsin in June of 1907. At West Point the future general immediately made the varsity football, baseball, and basketball teams, and acquired a reputation as "one of West Point's all-time athletic greats." "I was just good enough to make the varsity," is the way he puts it. Graduated in June 1911, he received his B.S. and was commissioned a second lieutenant of Cavalry.

Lieutenant Surles joined the Fifteenth Cavalry in Virginia in September 1911, and after a year accompanied his regiment to Texas, where they were stationed for three years. While in Texas, the twenty-eight-year-old lieutenant was married to Anna Lee Gaines, the daughter of an El Paso banker. Eight months later Surles embarked for the Philippine Islands, where he served two years at Fort William McKinley, returning in September 1917 with the rank of captain.

After six months of duty in California, Arizona, and New Jersey, the thirty-one-year-old captain sailed for France, where he served with the Fifteenth Cavalry and received a temporary promotion to major in June 1918. In July Surles was given command of the Remount Depot at Bayonne and Camp Souge, and the next year had a succession of staff posts. A month as staff athletic officer at Tours under the Service of Supply was followed by two with the Personnel Section and then four with the Training Section of the AEF General Staff. Somewhere along the line Surles was made an officer of the French Order of the Black Star.

Reverting to the permanent rank of captain in August 1919, the cavalryman returned to the United States and was assigned to West Point as an instructor; a year later he was advanced to major. (According to Lemuel F. Parton in the New York *Sun*, in 1919 Surles was staff athletic officer and later football representative of the Third Corps Area, with headquarters in Baltimore.) Leaving the Point in September 1923, Major Surles enrolled for the Cavalry School's advanced course, which he completed in June 1924, and was then ordered to the Command and General Staff School, also in Kansas. Upon his graduation from the latter in June 1925, the Major joined the Seventh Cavalry in Texas, where he spent two years as a regimental officer. Next he moved up to the First Cavalry Division staff as assistant chief of staff for military intelligence.

Three years in Intelligence were followed by a period with the Third Cavalry near Washington, and then Surles was ordered to the Army War College in the Capital, which gives the service's highest schooling. Graduated in June 1935, he was soon promoted to lieutenant colonel and was assigned to the War Department as chief of the public relations branch, Military Intelligence Division. This press section consisted of two small offices inhabited by the Colonel and two assistants, and its main problem at the time was answering the chorus of pacifist and isolationist disapproval, which reached its maximum in 1937, when the Neutrality Act was passed. According to *Time*, "newsmen rated him the ablest question-answerer ever to hold down the job" during his four-year stay.

In June 1939 Surles got a field assignment with the Seventh Cavalry—but it was mechanized cavalry, guarding the country's hoard of gold bullion at Fort Knox, Kentucky. While there he was given command of a light tank regiment, the First Armored. In March 1940 Surles was promoted to colonel, and in July he was ordered to duty with the First Armored Division. A year later, in the Army expansion, the popular officer was made a brigadier general (temporary) and appointed director of the War Department Bureau of Public Relations, succeeding a major general. "Frankly regretful to leave Fort Knox, which shared his disappointment," General Surles was described by *Time* as "characteristically modest about his plans for tackling the big headaches ahead": "I'll let the newspaper boys do the writing. I'll furnish the facts. That's my idea of the job. There is definitely no idea of censorship."

In contrast to its earlier modest establishment, Surles found the Bureau to consist of eight departments, manned by "a dozen lieutenant colonels, fifteen majors, ten captains, twenty-five lieutenants, twenty civilian writers, picture and radio editors, assorted experts of all shades, plus more than one hundred and fifty clerks, typists, stenographers, mimeograph operators, and so forth." And this was while the country was still at peace. Four months after taking over the job, the fifty-five-year-old general had to deal with the accounts of the surprise attack on Pearl Harbor; and from that time on the pressure of his duties increased with the need for censorship, the number of war correspondents, the size and diversity of the Army, and the tempo of its accomplishments. In February 1942 he was given his second star (temporary). That October, after a press agent's stunt had started a spy hunt, a departmental reorganization placed him in charge of all public relations work for the War Department. This was organized in four divisions—news, war intelligence, industrial service, and executive, the last-named including Army Emergency Relief for soldiers' dependents.

Surles accompanied President Roosevelt '42 and Secretary of State Cordell Hull '40 to the Quebec conference with Winston Churchill '42 and Anthony Eden '40 in August 1943; his Navy equivalent also attended, together with an OWI representative and the President's press secretary, Steve Early '41. The General also accompanied Secretary of War Henry L. Stimson '40 on his inspection trip to Europe in July 1944, and was one of the galaxy of generals present when the flag that had flown over the Capitol on Pearl Harbor Day was raised in triumph over Mussolini's '42 palace. But there were less pleasant aspects of his job, stemming mainly from the inevitable cross-purposes of publication and censorship. One occasion which found the General in "no-man's-land between the public and the armed forces" was that of the incomplete and conflicting reports of American losses after Colonel Jimmy Doolittle's '42 famous air raid on Japan in April 1942. Another was the Alton Levy case in October 1943, when the War Department refused to make public its report of the court-martial of the former I.L.G.W.U. organizer, whose union claimed that he had been "railroaded" for protesting against discriminatory practices against Negro troops at one air base. Perhaps the "hottest" one to handle was the Patton '43 soldier-slapping incident, which Drew Pearson '41 revealed that November.

Other occasions when Army officials either censored or edited material to conceal alleged errors or mishaps (such as antiaircraft guns firing on friendly planes) found Surles in the line of editorial fire. One of the bitterest and most consistent protesters in such cases was the newspaper *PM* which editorialized: "We have had many occasions to appeal directly to the General against attempts by lesser officials to use the power of military censorship to suppress or alter stories or facts to protect individual officers or the Army itself from criticism. In no single case where General Surles has passed on such an appeal have we found that he has permitted any factor save military security to influence his decision. . . . We think there are lots of holes in the Army treatment of news. There are lots of things the people are not finding out that they should find out. But what passes through General Surles's hands . . . comes out straight and honest." In April 1945 *PM*'s editor, John P. Lewis, again declared, "I can't think of a case in which appeal was made from misuse of the censor's pencil that was not cleared up satisfactorily and censorship limited to security."

When all the Army publicity and information services were to be reorganized on a postwar basis, General Surles was named Director of Information. As announced in September 1945, he was to exercise "over-all policy direction" over three divisions: To his Bureau of Public Relations were added the Legislative and Liaison Division of the War Department special staff, to deal with Congress, and the Information and Education Division of the Army Service Forces, devoted to the troops. In December the General was assigned to special duty on the staff of General Dwight D. Eisenhower, Chief of Staff. Lieutenant General Joseph L. Collins succeeded him as Director of Information for the War Department.

The tall, lanky general (five feet eleven inches, one hundred and fifty-five pounds) is said to "fancy himself a yellow-legged cavalryman rather than a press agent," and to look the part from head to heels. He is described as having an affable manner, tact, and a talent for making friends—the qualities which presumably won him the post of wartime censor-in-chief. Surles is a member of the Army and Navy Club and the Army and Navy Country Club. He and Mrs. Surles have two sons, Alexander Day, a Regular Army officer, and William Gaines Surles.

Who's Who in America, 1944-45

SUZUKI, KANTARO, BARON (sōō-zōō-kĭ kän-tä-rō′) Dec. 24, 1867- Japanese statesman

The Japanese Premier who was in office during the last fateful months of Nippon's defeat is Admiral the Baron Kantaro Suzuki. The first son of Yutetsu Suzuki (Suzuki is perhaps one of the commonest names in Japan), he was born December 24, 1867. His birthplace is usually given as Osaka, but *Who's Who in Japan* gives Chiba-ken (near Tokyo). The Japanese Empire (Nippon) was at that time under the rule of the Tokugawa Shogunate, hereditary dictatorship of great feudal lords—literally, generals—who since 1598 had kept the sacred Imperial family in enforced retirement. Only ten days after Suzuki's birth, on January 3, 1868, came the Meiji Restoration, when "a combination of out-of-power Shoguns, merchants, lesser Samurai [knights], and loyal court nobles" succeeded in overthrowing the Shogunate and placing the Emperor Meiji on the throne.

Thus Suzuki grew up in an essentially feudal society, strictly disciplined and theocratically based; yet one which was in the process of industrialization and material Westernization. The Japanese, who never questioned their own inherent divinity and superior culture, were shocked to learn that the Occident regarded

SUZUKI, KANTARO, BARON—*Continued*

them as backward and inferior; and Suzuki grew up, also, in a nation seeking to prove its greatness by territorial aggrandizement. Suzuki himself, when his views came to be of importance, was a moderate; but, as the New York *Herald Tribune* wrote editorially, "a moderate in Japan often is a person just as devoted to the idea of conquering the world as anyone in the Empire. The difference between a moderate and an extremist frequently has been that the extremist believed the Japanese could enslave the world in a year or two, while the moderate was of the opinion that it might take several decades."

According to Maurice Crain in *Rulers of the World,* Japanese naval officers are drawn from the Samurai and rich merchant classes. Young Suzuki entered the Imperial Naval College at seventeen and began in 1887 forty years of active service. He was "an up-and-coming naval officer" during the war with the Chinese Empire in 1894-95, which was fought for the ostensible purpose of freeing Korea. However, three great powers—France, Germany, and Russia—brought pressure on the victorious Nipponese and forced them to accept Formosa, renamed Chosen, and an indemnity in place of Liaotung Pennisular in Manchuria. Three years later, thirty-year-old Kantaro Suzuki became a lieutenant commander, and in 1903 he was promoted to commander. The second war in which he served against Czarist Russia (1904-05), ended in a naval victory which not only won Japan "treaty rights" in southern Manchuria and led to the annexation of Korea five years later, but brought the Empire its first recognition as a power in world affairs.

Suzuki avoided identification either with the "Army clique" which favored expansion on the Asiatic continent, or the "Navy clique" which looked toward conquest in the South Seas, and rose eventually to the supreme naval command. In August 1913 he was in command of the Second Squadron, and that December became chief of the Navy's Personnel Bureau. In September 1917 he left this important shore duty to assume command of the training squadron. On one training cruise which took the squadron to the United States in 1918, Suzuki made a speech at a San Francisco reception; he quotes himself as saying, "The Pacific Ocean is a peaceful ocean, true to its name, which the gods favor for peaceful trade between Japan and the United States. . . . If the Pacific Ocean should be used for the transportation of armed forces, both Japan and the United States would never escape Heaven's punishment." The years which followed brought Suzuki many high posts. He served for a time as Vice-Minister of the Navy (the War and Navy ministers are always named to the Cabinet from the officer corps); he commanded the Kure Naval Station, was commander-in-chief of the combined fleet, then chief of the Navy General Staff, with a rank equivalent to that of a five-star admiral in the British and American navies. In 1927, when Suzuki was nearly sixty, he retired from the Navy and was appointed to the Supreme War Council.

In 1929 the elderly admiral succeeded the famous Admiral Togo as Grand Chamberlain (and Privy Councillor), a post in which he was a member of the Imperial household, literally and figuratively close to the "Son of Heaven," young Emperor Hirohito '42. *Time* says he "walked a few respectful paces behind Hirohito at public functions, helped name the Emperor's first-born son [Tsugu-no-maya Akihito]. Most important, he served as the door through which the war lords had access to the throne." (The Army and Navy heads and members of the General Staff have direct and immediate access to the Emperor and can appeal any decision over the Premier's head.) Suzuki's "moderate" counsels enraged the Kwantung Army group of "young officers" bent on quick conquests in Manchuria in 1931; and on February 26, 1936 he was one of the victims of their "Showa Restoration" mutiny. (Showa, literally "radiant peace," was the designation Hirohito had chosen for his reign.) As *Time* tells the story, "the Grand Chamberlain had just come through Tokyo's snowy streets from dinner and movies at the United States Embassy—a 'happy evening,' Ambassador Joseph Grew '41 noted in his diary. The young officers had just come from their barracks, with swords and submachine guns [they succeeded in killing twenty-four venerable dignitaries and the Premier's brother-in-law, whom they mistook for the Premier]. . . .The Grand Chamberlain, confronted by a hundred wild-eyed soldiers, argued with them for ten minutes. When words failed, he straightened up, commanded, 'Then shoot me!' They did, and he crumpled in a pool of blood. The rebels burned incense over his body, saluted, and hurried off. The incense and the salute were premature." Other accounts say that Suzuki was shot at three times but hardly injured; that he received several sword wounds; that his life was despaired of. All these accounts may be true; even a slight injury could be extremely serious to a seventy-year-old man. At any rate, Admiral Suzuki resigned the Chamberlainship, and the Emperor rewarded his services with a peerage. The rebellion had been called off at the Emperor's order, or, as John Gunther '40 reports in *Inside Asia,* the rebels surrendered bloodlessly because they had no positive program, no place to go from there.

In August 1944, upon the death of the President of the Privy Council, Baron Suzuki was elected to replace him; and in April 1945, on the resignation of Premier General Kuniaki Koiso, the seventy-seven-year-old peer was appointed to succeed him. Adding to the rapidly deteriorating war situation which confronted Suzuki, the Soviet Government chose that same day to denounce its neutrality pact with Japan. The Empire's military situation was also critical, with every indication that it was about to become worse: a "mounting series of disasters" had been capped by the American invasion of Okinawa, only three hundred and sixty miles from the home islands. This island in the Ryukyus chain, nearly seven thousand miles from the United States, was only two hours by bomber from Japan, which was already under bombardment by American Superfortresses based in China and the Marianas. *Time* reports that while making up his

Cabinet, Suzuki was forced to take shelter from an hour-long air raid.

Suzuki's Cabinet, which contained fewer military men than his predecessor's, was by no means the "peace cabinet" which some foreign observers expected, and included several "violently anti-American" ministers. "While shunting the more reckless but incompetent militarists into the background," commented the New York *Times*, "the new Cabinet is really a Cabinet of national concentration formed for the purpose of an even more vigorous prosecution of the war . . . [comprising] the Elder Statesmen, the Manchuria Gang [i.e., the Kwantung Army group], and the Navy, big business, the old political parties, the new and supposedly more dynamic 'Sure Victory' party, and above all the Court." The Associated Press also reported the Suzuki Cabinet "a strong one, composed of some of the Empire's best production experts, with emphasis on the development of the war potential in Korea and Manchuria." Later that month, on the death of the American President, Franklin D. Roosevelt ['42], Suzuki broadcast his "profound sympathy" for the "great loss his passing means to the American people"; but he did not bother to congratulate his ally, Reichsführer Adolf Hitler ['42], on the latter's fifty-sixth birthday. In May, as a result of the German and Italian surrender, Suzuki's Cabinet abrogated all treaties with European countries, and in June it asked for and received dictatorial powers. Within another two months, on August 14, 1945, Nippon's crisis, after repeated bombings by American and British planes, the Russian advance in Manchuria, and the climactic dropping of the two atomic bombs, ended in unconditional surrender. Suzuki thereupon tendered the resignation of his Cabinet because of "the new situation created by Japanese acceptance of the Potsdam declaration." His successor was Prince Naruhiko Higashi-Kuni, a cousin of Emperor Hirohito and the first member of the Imperial family ever to head a Japanese cabinet. By the end of the year Suzuki's resignation as President of the Privy Council was predicted by the Tokyo correspondent of the New York *Times.*

Admiral Baron Suzuki is a white-haired, heavy-browed old courtier with a "soup-strainer" mustache. Photographs show him wearing a number of decorations, although not nearly so many as, for instance, Premier General Tojo ['41]. Suzuki was married in 1915, when he was forty-seven. He was said to have much influence with the Emperor. As befits a Japanese official, he is a devout worshipper at the shrines of the state religion, Shinto. As Premier, Suzuki had an extraordinary official residence, which John Gunther describes in *Inside Asia.* "Like Frank Lloyd Wright's ['41] Imperial Hotel, which withstood the 1923 earthquake, it is built on a kind of floating foundation to resist seismic shocks, and is full of bewildering passageways, interior bridges, and rooms within rooms. It contains, too, various devices to impede assassins, including secret exits and bombproof doors; one legend—the Japanese scoff at it but not very convincingly—is that the Prime Minister, if he is in danger at night, can push a button, whereupon he disappears, bed and all, into a steel vault." These precautions lose much of their comic quality when it is recalled that the post of Premier of Japan is beset with occupational hazards; that from 1918 to 1936 more than a quarter of the Premiers were murdered; and that, as Gunther comments, "among modern peoples only the Arabs have such an instinct to consider assassination as an acceptable political weapon."

SYMINGTON, W(ILLIAM) STUART (3D) (sĭ'mĭng-tŭn) June 26, 1901- United States Government official

Address: b. Surplus Property Administration, 811 Vermont Ave., N.W., Washington, D.C.; h. Route 2, Creve Coeur, Mo.

One of the key jobs on the reconversion scene in the United States was entrusted to a young, liberal-minded businessman when W. Stuart Symington was named chairman of the three-man Surplus Property Board in June 1945, and several months later administrator of the superseding Surplus Property Administration. In 1945 he thus held "one of the toughest administrative jobs in Washington"—disposal of billions of dollars' worth of surplus war property. He early indicated the course of his plans—the promotion of full employment and local enterprise in disposing of surplus material. Well known as an industrialist, Symington won a reputation for himself in the business world for rehabilitating small businesses. His cooperation with labor and the labor record of the Emerson Electric Manufacturing Company under his management brought him wide recognition as a forward-looking executive.

The son of William Stuart and Emily Haxall (Harrison) Symington, William Stuart Symington 3d was born into a wealthy family in Amherst, Massachusetts, on June 26, 1901. Brought up in Baltimore, he joined the Army while still in his teens in the last year of the First World War. After his military service Symington completed his education, attending Yale University from 1919 to 1923. He participated in campus affairs, was associate editor of the *Yale Daily News,* and a member of the Dramatic Association, the University Club, and D.K.E. When he left Yale in 1923 he entered one of his family's concerns, Symington Company (now Symington-Gould), a railroad equipment plant. But the young businessman found fault with the company product

W. STUART SYMINGTON

and was discharged. According to one writer, "the family gave him another chance at a drafting board." This work, however, did not satisfy Symington. He soon bought a clay products company which within a short time became a successful enterprise. In 1927, entering another branch of the family interests, he became president of the Gould Car Lighting Company and vice-president of the Gould Storage Battery Company. Of the latter experience he remarks, "The family fired me again, this time because I told the president no one on the lot knew how to make batteries."

In 1928 the blunt-tongued industrialist sold Gould Car Lighting and began to manufacture radio loudspeakers under the name of Valley Appliances, Inc. Merging this concern with the Colonial Radio Corporation in 1930, Symington became president of Colonial Radio in Rochester, New York, in which capacity he served for five years. Under his direction this company grew into a "big-set" manufacturer, equipped to ride out the storm of the depression. But in 1935, when he was offered the job of reorganizing the Rustless Iron and Steel Company, Symington accepted. Thus he returned again to Baltimore, where, as president of the iron and steel company for two years, he succeeded in his reorganization of the firm.

The executive was "dabbling" in new inventions when in 1938 he became interested in the Emerson Electric Manufacturing Company. In assuming the presidency of this St. Louis concern, Symington was again faced with a difficult industrial situation. Emerson was in bad financial straits, with labor troubles rife. The executive proceeded to untangle the financial affairs, then set to work on the labor problem. His solution of this was to work with the representative of the CIO's United Electrical and Radio Machine Workers of America, which covered Emerson. The St. Louis U.E. organizer was William Sentner, who also happened to be a Communist. The story of Symington's dealings with Sentner in working out amicable labor relations is told in a lengthy *Fortune* Magazine article, "A Yaleman and a Communist" (November 1943).

Symington's decision to cooperate with his employees through the union is said to have been based on his desire to make the company profitable as well as a good place to work. The industrialist assisted in the consolidation of the union at Emerson, saying, "If I'm going to have a union, I'm going to have a good union." A profit-sharing plan was instituted and the employees rallied to the support of the company, with the result that the plant maintained a high production record and was labeled "the only big war plant in St. Louis that has had no labor trouble." One report found that within two years Symington had "converted Emerson from a thing fit for the flies into a robust small business." The executive pointed out that the union-company relationship was "balanced industrial democracy that works." It is his belief that under the Wagner '41 Act industry must deal with the workers' elected representatives without regard to personal politics.

While in the beginning some St. Louis businessmen condemned Symington's attitude toward the union, especially his cooperation with a Communist, his success was rapidly apparent and he was soon approved by business leaders. He became a member of the board of directors of the Chamber of Commerce and vice-chairman of the Committee for Economic Development. Serving also in various community groups, he was a member of the Mayor's Interracial Committee. At his St. Louis club, it is reported that he "often startled the old elite with his unconventional views on labor, his quick, nervous energy, his thoroughly Eastern glibness." In the course of his work at Emerson, his handling of war contracts necessitated Washington conferences and in 1941 a trip to England to study British experience in the manufacture of bomber turrets, as an observer for the Office of Production Management.

Following his appointment to the chairmanship of the Surplus Property Board on June 7, 1945, which was confirmed by the Senate on July 12, Symington resigned from his post at Emerson. The Presidential choice of the Missouri executive to replace Senator Guy M. Gillette was said to have been based on Truman's acquaintance with Symington's labor record at Emerson, which was revealed in a Congressional war contracts investigation when the President was a Senator. Press reaction was generally favorable, his industrial experience and labor record receiving special stress. In the New York *Times* C. F. Hughes wrote, "With the appointment of a businessman to head the Board, it is possible that political considerations will play a smaller part in guiding its policies." Most commentators pointed out the difficulties of Symington's new job, while *Time* declared that the disposal of approximately ninety billion dollars of surplus war property is dependent upon his use of the "confused" Surplus Property Act of 1944. On July 17 President Truman in a message to Congress urged revision of this law, calling for a single administrator instead of the three-man board. This action was interpreted by Arthur Krock '43 as a move toward more efficient government. On September 12 Congressional approval was given this revision. Symington became the head of the powerful Surplus Property Administration in October and thus "the first person in history to run a one-hundred-billion-dollar secondhand store."

W. Stuart Symington had listed as a first objective the creation of jobs and aid to small business. "If we do not promote local, independent business," Symington said, "we will end up with a few great companies. That would be most unfortunate for the economy." Symington is willing to dispose of material at a loss in order to attain these objectives. He favors continuation of the Pacific Coast steel industry, in which Henry J. Kaiser '42 has shown considerable interest. In early September Symington was named as a member of a delegation who would visit Europe to investigate the surplus property situation.

The Surplus Property Administration chief made a good impression in liberal quarters when he ruled, with the approval of Congress and the courts, that the seven hundred million dollars' worth of Government war-built aluminum plants should not be sold or leased to ALCOA because that firm already had a monopoly. However, would-be competitors of ALCOA claimed that they could not operate without government subsidies in some form, and ALCOA, on the other hand, protested that subsidies would mean "government in business" and "government competition." The issue drifted into a stalemate. Senator Hugh D. Mitchell, chairman of a special subcommittee of the Senate War Investigating Committee on Surplus Property, in November 1945 criticized the Surplus Property Administration and the Office of War Mobilization and Reconversion, which, he said, were furthering the ALCOA monopoly by "do-nothing" tactics. In December 1945 Symington moved to alleviate the veterans' housing shortage by formally authorizing Federal agencies to turn over to New York and other state and local governments without charge surplus land, materials, and equipment for conversion to emergency housing projects.

While the end of 1945 found Symington still in his SPA office, the possibility of change was seen in a *United States News* comment on December 28: "W. Stuart Symington . . . is coming around to the idea that his job should be liquidated and the functions of the office shifted to the War Assets Corporation now organized inside the Reconstruction Finance Corporation to handle surplus disposal in this country."

Described as "no proletarian," Symington is nevertheless also said to be keenly aware of trends on the labor scene. He was reported as studying proposals for an annual wage, one of the objectives of organized labor. *PM* has stated that this business leader believes in the right of the worker to his job. He also believes that postwar cooperation between industry and the Government is essential, "unless they both want to kick the whole system over." On the political scene, he supported Thomas E. Dewey '44 in 1940, but eventually voted for Wendell L. Willkie '40. In the 1944 campaign he backed President Roosevelt '42, serving on a committee for his re-election. The executive denies having any personal political ambitions. His contacts in the world of big business are vast and he is said to possess an "uncanny intuition." One writer has said, "He is not an explicit fellow who consciously charts a course and sticks to it. Rather his actions are instinctive and emotional." Another writer has described him as a "smart, energetic industrialist."

Handsome "Stu" Symington is over six feet tall and weighs one hundred and ninety pounds, "a lanky, loose-jointed" man who "canters around with the exuberant energy of a well-bred horse." Square-jawed, with blue eyes and "taffy-colored" hair, he is often called "charming." The affluent executive was married to Evelyn Wadsworth, the daughter of Republican Congressman James W. Wadsworth '43, on March 1, 1924; they have two sons, William Stuart and James Wadsworth. As Eve Symington, Mrs. Symington was at one time a popular "society chanteuse." The new Government official enjoys tennis, golf, and an occasional game of bridge. In the words of one reporter, "he either works hard and enjoys it, or quits in favor of long sabbaticals."

SZELL, GEORGE (sĕl) June 7, 1897-
Conductor; composer; pianist
Address: b. c/o Columbia Concerts, Inc., 113 W. 57th St., New York City; h. 7 Park Ave., New York City

One of the most distinguished of the younger opera and concert conductors in the United States, George Szell has at one time or another appeared as conductor or guest conductor with almost every leading orchestra in Europe and America. The Hungarian-born conductor-pianist-composer is, in the opinion of Olin Downes '43, "a leader of stature and widely eclectic understanding . . . a conductor of high rank." Although Szell himself states that he has conducted more operas by composers other than Wagner since his debut in the United States in 1940, he has become best known for his interpretation of the works of the noted German. "It is my specialty," the conductor is said to have declared, "not to have any specialty."

While sometimes thought of as a Czechoslovakian because of his long residence in Prague, George Szell is a Hungarian, born in Budapest on June 7, 1897. He is the only child of George Charles and Maragarethe

GEORGE SZELL

(Harmat) Szell. George spent most of his childhood in Vienna, to which his parents had moved soon after his birth. At the age of four the boy knew when a wrong note was played in a piano piece, and within another year or so, it is said, he wrote from memory thirty measures of a musical selection he had heard the day before. Shortly thereafter the enthusiastic parents turned their son over to Richard Robert, "one of the greatest teachers of the keyboard," for a month's trial. Robert was impressed enough to accept the boy as his pupil, and George remained with him for about ten years. At the same time these lessons were supplemented by the study of composition and theory with Eusebius Mandyczewski, the famous Brahms scholar; he also studied with Joseph Bohuslav Förster and Max Reger.

At the age of ten George made his first public appearance, playing with the Vienna Symphony Orchestra at the Grosse Musikvereinssaal, the largest concert hall in Vienna. His playing of the Mozart Concerto in A Major, Mendelssohn's B Minor *Capriccio brillante*, and his own *Rondo* was climaxed by the orchestra's performance of an overture George had composed. This concert was so successful that he received invitations to play in other cities of Europe. His parents decided, however, that it was unwise to allow the abnormal life of the child prodigy to endanger his future. He therefore studied with private teachers in Vienna until he was sixteen, and also (in the same city) at the State Academy of Music, from which he was graduated. The young musician appeared publicly only for occasional performances in Prague, Dresden, and at Albert and Queen's halls in London, in concerts under the baton of Sir Landon Ronald. During these early years his own ideas about his musical future were taking shape; although the emphasis in his training had been upon the piano, young Szell soon declared his preference for conducting. His first opportunity to display his latent talent came when the regular conductor of the Vienna Symphony, having sustained an arm injury, asked him to take the baton.

In 1914, at the age of seventeen, Szell made his debut as a guest conductor, appearing with the Berlin Philharmonic Orchestra. The program consisted of Beethoven's "Emperor" Concerto, Richard Strauss's '44 tone poem, *Till Eulenspiegel*, and a symphonic composition of his own which he had written at the age of fourteen. A year later Szell was appointed assistant conductor at the Royal Opera in Berlin. There he worked under Strauss, his duties ranging from the most insignificant chores to the conducting of Strauss's *Ariadne auf Naxos*. It was during this period that the future interpreter of Wagner received his first insight into the works of the composer of the Ring cycle, for Strauss was an ardent admirer of Wagner.

When Otto Klemperer (now a conductor in the United States) left his post in 1917 as first conductor of the Strasbourg Municipal Theater, Szell, who had been recommended by Strauss, replaced him for a season. For the next six years the young conductor filled the post of conductor in several cities: the German National Theater in Prague, 1919; the Court Theater in Darmstadt, 1921-24; the Municipal Theater at Düsseldorf, 1922-24. From 1924 to 1929 Szell was the principal conductor for the Berlin State Opera House and the Berlin Broadcasting Symphony Orchestra. During these years his prestige was growing—he was acclaimed for conducting music that displayed "intriguing zest and force." (At this period he was also teaching at the Berlin State Academy of Music.)

For the next eight years, commencing in 1929, Szell's life was centered mostly in Prague, where he was general musical director of the Philharmonic Concerts and the German Opera House, and where he taught at the Academy of Music and Dramatic Arts. In these years he took temporary leaves to appear as guest conductor with the Vienna, Berlin, and London philharmonic orchestras, and with the symphonic orchestras at Leningrad, Amsterdam, The Hague, Brussels, Stockholm, and Copenhagen. In 1931 he came to the United States for three months, appearing as guest conductor with the St. Louis Symphony. Of one of his concerts, "a typical balance between the classic and modern," the St. Louis *Times* (March 28, 1931) wrote, "It was one of the few really great concerts."

In 1937 Szell succeeded John Barbirolli '40 as general conductor of the Scottish Orchestra of Glasgow, at the same time accepting appointment as semi-permanent conductor of the Residentie Orkest of The Hague (he held both posts for two years). Twice in the next two years he flew to Australia to conduct the Celebrity Concerts of the Australian Broadcasting Commission in Sydney and Melbourne, and when the Second World War broke out he was in New York. Since the Scottish Orchestra had been disbanded when the war began, Szell decided to make the United States his new home.

Because of other commitments Szell had the previous spring he declined Toscanini's '42 invitation to conduct the newly formed National Broadcasting Company Symphony Orchestra. His first concert in America since 1931 therefore took place at the Hollywood Bowl when he appeared as guest conductor with the Los Angeles Philharmonic Orchestra. (He was to return for four more years.) In 1941 he made his first public appearance in New York, directing four concerts of the National Broadcasting Symphony Orchestra over the period March 1941-January 1942. His programs included Strauss's *Till Eulenspiegel*, "a presentation displaying great technical virtuosity"; the "Eroica" Symphony by Beethoven, "an accomplishment of a musician whose knowledge and sincerity are never in question"; Schumann's Fourth Symphony, "an example of clean, clear articulation of phrase"; and Mozart's Piano Concerto in C Major, "an expression of noble interpretation." He also conducted during this year the Chicago Symphony Orchestra at the Ravinia Festival, and the Detroit Symphony and the Los Angeles Philharmonic orchestras. In 1942, in addition to fulfilling other engagements, he appeared as guest conductor of fifteen performances at the Metropolitan Opera House, and in early 1943 he made his first appearance with the Boston Symphony Orchestra.

Upon the opening of the 1944-45 season of the Metropolitan Opera House Szell assumed the status of permanent conductor. His interpretations of Wagner during the season were widely acclaimed in the musical world, Louis Biancolli of the New York *World-Telegram* declaring that "Wagnerism is in the man's blood." Robert Bagar found Szell's conducting of *Götterdämmerung* "of commanding brilliance," and in the opinion of Oscar Thompson, Szell's direction of *Die Walküre* demonstrated "musical leadership of a distinguished order." According to Jerome D. Bohm of the New York *Herald Tribune*, "the cogency and justly paced melos" of the performances of *Das Rheingold* and *Siegfried* must go to Szell." *PM*, discussing the four operas of the Wagner Ring, commented that Szell was "the star of each performance." His masterly conducting of Wagner are attributed to his imaginative readings and thorough knowledge of the scores, which bring out sonority of sound and subtleties of tempo. In the words of a critic for *Musical America*, "George Szell is absolutely the life and soul of what Wagnerian opera he directs." During the 1944-45 season Szell also received very favorable reviews for his conducting of *Die Meistersinger*, Mozart's *Don Giovanni*, and Strauss's *Der Rosenkavalier*.

Szell's direction during 1944-45 of four performances by the New York Philharmonic-Symphony revealed a virtuosity in the reading of symphonic music equal to his operatic interpretations. Some of the works performed were Beethoven's "Eroica" Symphony, played with "a certain unaccustomed sweetness of sound"; Brahm's Fourth Symphony, conducted with "warmth, breadth, and virility"; Schumann's Fourth Symphony in D Minor, described as "admirably integrated"; and Haydn's C Major Symphony, "vitally conceived." In February 1945 Szell made his first New York appearance as a pianist, performing with the Budapest String Quartet in a program presented by the New Friends of Music at Town Hall. His playing of Mozart's G Minor and E-flat Major piano quartets evoked praise comparable to that describing his conducting. Mark A. Schubart of the New York *Times* said early in 1945, "It would be no exaggeration to say that of late no conductor in New York has received such universally—and almost monotonously—laudatory comments and public acclaim. He has joined that very small circle of truly authoritative conductors." The second annual poll of *Musical America*, announced in May 1945, confirmed this estimate by giving to Szell a place as an opera conductor second only to Bruno Walter '42.

Szell, in discussiong his art, contends that "since a conductor draws his expression from a manifold and complex human instrument, he requires a manifold and complex preparation." Conducting, asserts Szell, calls for aptitude and extensive training. A good conductor must possess the inherent qualities of good memory, a sense of rhythm, fairly absolute pitch, and confidence. In addition he must have a thorough grounding in the mechanics of music, such as theory, counterpoint, form, orchestration, and score reading, as well as a knowledge of different instruments. Since interpretation plays a very important part in conducting, Szell feels that a conductor must not only understand the work but must "re-create it for himself if he is to re-create it for others." The absence in America of a counterpart of the musician's apprenticeship in state opera houses in Europe is of much concern to Szell. This apprenticeship, he points out, gives the European musicians several years of varied musical experience—from the coaching of singers to the conducting of the orchestra. Some plan will be established, he hopes, whereby funds from American institutions and individuals will enable the management of the Metropolitan Opera House to create a number of such "internships" for aspiring conductors.

The armchair listener can hear George Szell's conducting on numerous recordings, and servicemen were able to hear him at the USO concerts he gave during the war. Szell is a tall man, has blue eyes, thinning blond hair. In January 1938 he was married to Helene Schulz, a Czechoslovak. He is attracted by widely different fields of knowledge, while among his hobbies are cooking, golf, bridge, and collecting amusing stories and odd journalistic misprints. Among his compositions are numerous works for the piano, the *Lyric Overture*, and variations on an original theme for orchestra. His happiest moments, Szell says, are those in which he succeeds in doing some justice to the works he conducts.

TAFT, CHARLES P(HELPS, 2d) Sept. 20, 1897- United States Government official; lawyer

Address: b. Dixie Terminal Bldg., Cincinnati, Ohio; Department of State, Washington, D. C.; h. 16 Garden Pl., Cincinnati, Ohio

The Second World War brought Charles P. Taft, younger brother of Senator Robert A. Taft '40, of the notable Taft family, to Washington from his activities in law and politics in Cincinnati. As a lawyer, author of two books, and as one of the founders of Cincinnati's highly successful city-manager government, Taft in 1945 served as director of the Office of Wartime Economic Affairs and of the Office of Transportation and Communications, both of the State Department. His championship of the Truman '45 Administration's 1945 reciprocal tariff program emphasized the distinction between him and his Senator-brother, who led the opposition to the measure. It has been said that this difference "symbolizes the differences within the Republican Party itself today—Charles Phelps representing the progressive wing of his party, and Robert the conservative."

When Charles Phelps Taft 2d was born in Cincinnati on September 20, 1897, his father William Howard Taft, who was to become twenty-seventh President and tenth Chief Justice of the United States, was a circuit judge and professor of law at the University of Cincinnati. William Howard was the third generation of Tafts to serve as a judge. His grandfather, Peter Rawson Taft of old Vermont farm stock, won distinction in his home state as a probate and county court judge. Peter Taft's son Alphonso attended Yale and, after obtaining his degree in law, migrated to Cincinnati, there to achieve renown but no wealth—rising from a local judgeship to a place in President Grant's Cabinet and to ambassadorial posts in Vienna and St. Petersburg. The mother of Charles Phelps, Helen Herron Taft, was the daughter of a lawyer. When the boy was three years old, his father was appointed president of the Philippine Commission, and a year later he became the first Civil Governor of the Islands. During their residence in Manila, the family spent summers in Yokohama and took a trip through China.

In 1905 William Howard Taft accepted the office of Secretary of War in Theodore Roosevelt's second term as President, and Washington became the home of the Tafts for the next eight years. With his brother Robert, young Charles was sent to the Taft School in Watertown, Connecticut, from which he was graduated in 1913. (This school had been founded and was directed by Horace Taft, the boys' uncle.) In 1909 the Tafts moved into the White House when William Howard Taft was elected to succeed Roosevelt.

Like his grandfather, father, and brother Robert, Charles attended Yale University. As an undergraduate he won the Gordon Brown prize for "manhood . . . scholarship . . . leadership"; he was also made a tackle on the football team and was captain of the basketball team. Then the entrance of the United States into the war interrupted his schooling. (He rereceived his B.A. degree *in absentia* in 1918.) He enlisted in the Army in May 1917 and was assigned to the Twelfth Field Artillery of the Second Division. In October of the same year the twenty-year-old soldier was married to Eleanor K. Chase, daughter of the president of the Ingersoll Watch Company. Young Taft served in France for a year, for a month at the front as a sergeant major before entering the Saumur Artillery School, from which he was graduated in August 1918; two months later he was commissioned a first lieutenant. Taft's military connection continued until March 1939 when he allowed his commission as a reserve officer to expire because of his inability to take any active training.

On his return to the United States Taft entered Yale's law school—he served as coach while there—and received his LL.B. degree in 1921. In 1922 the young man was admitted to the Ohio bar and with his brother Robert formed the law firm of Taft and Taft in Cincinnati. Their one-room law office expanded rapidly into one of the biggest and most profitable in the city. Two years later, Charlie Taft, as he is known in Cincinnati, became a member of the firm of Taft, Stettinius, and Hollister. Not the least of his assets as a successful lawyer is said to be his infectious smile. "Charlie smiled me out of court," has been the complaint of more than one legal opponent.

Taft has been in the thick of Cincinnati politics from the beginning of his legal career, when he was elected Hamilton County prosecuting attorney (1927-28), an office his father had held in 1881. He has generally backed "fusion" reform parties in local politics. Taft led and won a fight for charter revision in Ohio counties and for "a general cleanup of Cincinnati's government." *City Management* (1933) is Taft's story of how he and other citizens fought and won their battle against political misrule and bossism, and succeeded in establishing what is considered one of the best governed cities in the United States under the city-manager plan and charter. The New York *Times* called it "a rattling good tale." Told informally, the account is also a statistical and detailed report. From 1938 to 1942 the author-lawyer served as member of the Cincinnati Council.

You and I—and Roosevelt (1936), a small book, won for Taft praise as an author and caused Alf Landon '44, the 1936 Republican Presidential nominee, to make him chief of a three-man advisory board to serve during the campaign. (This board was facetiously dubbed "the Brain Trusters," because it acted as a fact-finding body in the same way that Raymond Moley '45 and others, similarly named, had served Roosevelt '42.) Landon had been attracted to Taft when he heard him speak at a Republican meeting the winter before on the subject of a progressive Republican program. After Taft had expanded that address in the book, *You and I—and Roosevelt,* he sent a copy to the Kansas Governor. On the flyleaf he had written: "To the man who fits the blueprint set forth in this little book." Landon liked the volume so much that he adopted it as a sort of campaign primer. The *Christian Science Monitor* said: "The great value—and it is great—of Taft's brief discussion of campaign issues is as a moderate's appeal to moderates." The *Saturday Review of Literature* prophesied that it would appeal to young Republicans but not to the Old Guard, and *Newsweek* credited Taft with forming the planks in the 1936 Republican platform on relief, social security, and civil service.

The Cincinnati attorney in 1941 assumed the responsibility of war duties in Washington. In March of that year he became one of a new three-man committee, headed by Joseph E. Davies '42, the President's Committee on War Relief Agencies, to handle and coordinate organized drives for both foreign and domestic relief funds. (This committee became known as the President's War Relief Control Board in July 1942.) In 1941 Taft was appointed also to the Office of Defense Health and Welfare Services of the Federal Security Agency. As assistant director of its health and welfare section Taft supported the war-area child-care bill of 1943 and programs for efficient handling of juvenile delinquency, and joined with the Public Health Service in a campaign to cut down the rate of venereal disease. He resigned in late 1943 to become special adviser to the State Department. He served there in the capacity of chairman of the Area Committee for Coordination of the Planning of United States Agencies, to assist in the economic rehabilitation of the East Indies, and as chairman of a similar committee for Malaya.

Since January 1944, when Secretary of State Cordell Hull '40 announced a reorganization of the State Department in accordance with the coordination plan of President Roosevelt, Taft has served as the director of the newly created Office of Wartime Economic Affairs. He supported extension and expansion of the ten-year-old Reciprocal Trade Agreements Act when the issue came before Congress in May and June 1945. In a "dramatic conflict of view," his Senator brother was among those who led the fight against the Administration-requested program. Charles P. Taft, wrote New York *World-Telegram* columnist Thomas L. Stokes, "is taking on the tariff—as in other issues—a broad and international viewpoint," while his brother "is taking the narrow, backward glance of the standpat G.O.P. based on localism and economic isolationism." "Time," stated Charles Taft, "is waiting for no man these days. Without prompt action to stabilize currencies, to finance reconstruction, and to stop the threat of spiraling tariffs and preferences and trade barriers abroad, the chances for expansion of private trade to supply needs and raise the standards of living in the world are slim indeed." On June 19, 1945, the Senate protectionists were defeated when the upper chamber voted (47 to 33) to give the President the right to cut 1945 tariff rates up to 50 per cent for nations making concessions.

Taft also served as director of the State Department's new Office of Transportation and Communications Policy in 1945. On May 11 his office announced that an agreement had been signed with the United Kingdom, France, Belgium, the Netherlands, Norway, and Luxembourg for the rehabilitation and operation of Western Europe's railways, highways, and canals. This seven-nation pact, which had a six-month tenure though a more permanent organization was contemplated, operated pending acceptance of a draft agreement for broader jurisdiction by Russia and other countries. Taft served, too, as an adviser to the American delegation to the San Francisco conference. Like his father, Taft favors a world organization; he has stated that "the real explanation of our failure in the [First World] War and in the peace is that having put our hand to the plow we—the United States—turned back. . . .Our influence for peace might have accomplished the dream of centuries," had we supported the League of Nations.

CHARLES P. TAFT

On July 26, 1945, Taft resigned from his State Department office, effective September 1, to return to Cincinnati and city politics. Joseph C. Grew '41, Acting Secretary of State, thanked him for the signal work he had done with the Department in various phases of economic activity. "We are particularly grateful," the Secretary said, "for the part he played in successfully achieving the extension of the Reciprocal Agreements Act, which is among the many valuable services he rendered." Taft continued as a member of the War Relief Control Board, working under President Truman, and as a member of the Army-Navy Committee on Education and Recreation.

Charles Taft is described as a tall, well-built man. He is active in the Episcopalian Church and has served as a member of the provisional committee for the World Council of Churches. From 1937 to 1939 he was chairman of the National Committee of Community Mobilization for Human Needs; he is a trustee of the Twentieth Century Fund and

TAFT, CHARLES P.—*Continued*

the Carnegie Institution of Washington. He also is a member of the Cincinnati and Ohio State bar associations, and of Beta Theta Pi and Phi Delta Phi. The Tafts have six children: Eleanor Kellogg (Mrs. Donald T. Hall), Sylvia Howard (Mrs. William Lotspeich), Seth Chase, Lucia Chase, Cynthia Herron, and Peter Rawson.

TAYLOR, A(LBERT) HOYT Jan. 1, 1879- Physicist; United States Navy consultant; radio engineer

Address: b. c/o Naval Research Laboratory, Washington, D.C.; h. 2910 Pennsylvania Ave., S. E., Washington, D.C.

"If the atomic bomb was the most powerful weapon evolved by the scientists [in the Second World War]," writes Dexter Masters, "radar was the most versatile. . . .It was taking on new jobs right up to the end, and at its older jobs it had become a staple of combat operations long before the end." Radar guided the aiming of guns, the navigation of ships and planes, the dropping of bombs, the control of bomber missions or the movements of a single paratrooper, penetrating darkness, distance, camouflage, and bad weather. Thousands of research workers in several countries had a hand in this electronic miracle, but one, Dr. A. Hoyt Taylor, chief physicist for the United States Navy, is regarded by many as the "father of radar." As he points out, radar was a development rather than a discovery; but his was perhaps the most important role in developing American radar.

Albert Hoyt Taylor was born in Chicago on the first day of 1879; his parents were Albert H. and Harriet (Getschell) Taylor. By the age of twenty he had begun research in the new field of radio, investigating the high-frequency waves, up to two hundred megacycles per second—frequencies which were to occupy the attention of scientists decades later. Taylor published his first report of findings in 1902, the year of his graduation from Northwestern University. In 1903 he joined the University of Wisconsin faculty as instructor in physics, and was promoted to assistant professor two years later.

In 1908-9 the young physicist studied for his Ph.D. in Germany, at the University of Göttingen. There, to quote a Navy release, he "associated with such pioneers as Simon, noted for his work in high-frequency arcs and analysis of alternating current phenomena by dynamical characteristics; Hilbert, the noted mathematician; and Voight, recognized for his work in mathematical physics." On his return to the United States, Taylor became professor and head of the physics department at the University of North Dakota, where he remained for eight years. In 1911 he was married to Sarah E. Hickman. (They have four children, Albert, Barbara, Harriet, and Margaret.)

After the United States entered the First World War, Taylor was commissioned a lieutenant in the Naval Reserve, becoming district communications superintendent of three naval districts. Later he organized and directed the Navy's transatlantic radio communication system. The scientist was afterward placed in charge of the experimental division of the naval air station at Hampton Roads, Virginia, and then of the Naval Aircraft Laboratory. At the time, this laboratory was in the Bureau of Standards, but it was moved to the Washington naval air station. Commander Taylor went on the USNR retired list in 1922, but remained with the Navy in a civilian capacity.

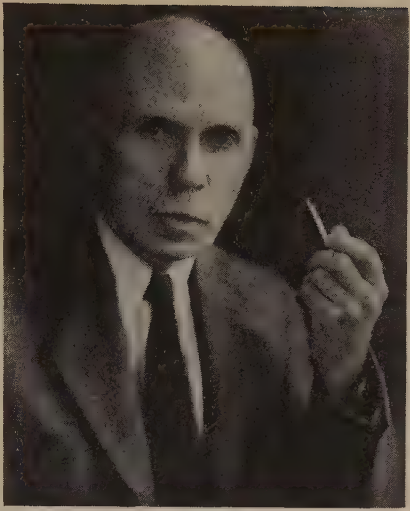
In September 1922 he and an assistant, Leo C. Young, were conducting experiments on the use of short waves in plane-to-plane and plane-to-ground communications. While attempting to measure signals transmitted from across the Potomac River, they were annoyed to find that the passing ships caused "a definite interference pattern." This gave them an idea, and the two researchers suggested to the Navy Department that "possibly an arrangement could be worked out whereby destroyers located in a line a number of miles apart could be immediately aware of the passage of an enemy vessel between any two destroyers in the line, irrespective of fog, darkness, or smoke screen"—the germ of the radar principle.

When the Naval Research Laboratory was established Taylor headed its radio division. To quote the Navy's official history of radar (released May 23, 1943), Taylor and his assistant superintendent Young experienced "almost unbelievable equipment difficulties, but... despite the pressure of their other work and the discouraging factors which face the pursual of most research work, Dr. Taylor and Mr. Young continued their trail. Between 1925 and 1930 the reflection phenomenon observed in 1922 was used to measure the height of the Kennelly-Heaviside layer, an atmospheric formation which acts as a reflector for certain beams [proving that the transmitter and receiver could be at the same place]. Dr. Taylor and Mr. Young did this work in conjunction with Dr. Gregory Breit and Dr. Merle A. Tuve, of the Carnegie Institute. . . .During this period, Dr. Taylor and Mr. Young also measured the time required for radio signals to go around the world by reflection from the Kennelly-Heaviside layer. For this purpose extremely brief radio signals were employed, and apparatus was developed to both transmit and receive such brief signals." (Articles reporting this work were said by members of a British technical mission in 1940 to have furnished the base on which Sir Robert Watson-Watt '45 and other British scientists had erected an independent system of radiolocation during the following years. The American development came to be called radar, the short name for radio detection and ranging.)

In January 1931 the Naval Research Laboratory was officially assigned to investigate the use of radio to detect the presence of enemy vessels and aircraft, with special emphasis on "the confidential nature of the problem." (A year later the Navy began to share its findings along this line with the Army, which went to work on its own forms of radio detection.) In July 1932 Taylor reported that moving airplanes had been detected at a distance of nearly fifty miles, and called for instruments to record and correlate data to show the position, angle, and speed of approaching planes. These were developed by Robert M. Page, with the assistance of Robert A. Guthrie. The Naval Affairs Committee of the House of Representatives, then headed by a former engineer, became "intensely interested" in the development of radar, and in 1935 it allotted the Naval Research Laboratory a hundred thousand dollars for its research.

The next problem was to adapt radar equipment to shipboard use. The first radars to go on board ships were put on the destroyer *Leary* in April 1937 and were followed in 1938 by an improved installation on the battleship *U.S.S. New York.* The ship's commander and the admiral in charge of the battleship division were enthusiastic about the results. The first contract for radar equipment—six sets—was awarded in 1939 to the Radio Corporation of America, which, with Bell Laboratories, had been cooperating in the research. That September the Americans exchanged technical information with a British technical mission which included Sir Robert Watson-Watt, developer of British radar. In August 1940, when the United States began to look uneasily at its defenses, General Electric became the first company to transfer all its radio engineers to radar work.

As Barbara Klaw wrote in the New York *Post*, "Dr. Taylor and his closest associates, Leo C. Young and R. M. Page, found themselves saddled with the multiple duties of launching a great new science. For a few furious years they taught students, organized industry, designed and installed equipment, while carrying on their still incomplete research at the same time." Finally, in 1941, radar went into quantity production. A radar set, operated by an Army private, actually detected the Japanese planes approaching Pearl Harbor on December 7; the warning went unheeded, however, as the technician's superior assumed that the planes were a scheduled flight of American B-17's. Once the United States was in the war, radar underwent spectacular development under conditions of greatest secrecy.



A. HOYT TAYLOR

As explained by Taylor, "radar is simply an echo of light. In the old days of river steamers the ship captain would toot the horn on foggy days and by judging the length of time it took for an echo to return from the river banks he would judge the position of his boat in the stream. The principle of radar is the same. We send out pulsating streams or beams of electric impulses. When these impulses strike an object they rebound. When the rebound is recorded we can compute the distance and in most cases the size and nature of the object which sent the impulse echo back to us." These radio waves travel at nearly the speed of light, 186,000 miles per second; by means of a modulator, they are sent through the antenna in bursts of about one-millionth of a second duration with pauses of a few thousandths of a second to allow the receiver to handle the returning impulses. A 'scope (oscilloscope) or viewing screen transforms the invisible radio signals to visible patterns of dark and light which can be easily interpreted by a skilled operator. These are the essentials. There were many modifications for different uses, ranging from small sets for fighter planes to hundred-man installations occupying an acre or more. One of the special devices was IFF—identification of friend or foe —carried by each American ship and plane, which automatically gave out an identifying code signal when struck by radar waves. American radar was generally acknowledged to be the best in the world, and to have contributed immensely to victory. The funds allotted the

TAYLOR, A. HOYT—*Continued*

Naval Research Laboratory for 1945, incidentally, were estimated at nearly nine million dollars—almost three thousand times its average annual budget up to 1942.

In July 1945 Taylor, until then superintendent of the radio division of the laboratory, became the laboratory's chief consultant and chief coordinator for electronics. He has to his credit about fifty patented inventions concerning radio, "the development of theory and practice of propagation of high-frequency energy, the development and application of the quartz crystal oscillator, and the development of high- and super-frequency radio communication systems, which have seen wide application, not alone in the Navy, but in all Government and commercial service."

In March 1944 Taylor was awarded one of the first two United States Medals for Merit, awarded to civilians for outstanding services in the war, in recognition of his work in developing radar (the other medal went to John C. Garand '45 for the Garand rifle). Secretary of State Cordell Hull presented the medal to Taylor with a citation ending with these words: "His [Taylor's] foresight, technical skill and steadfast perseverance contributed in large measure to the timely introduction of a scientific device which has yielded the United States Navy a definite advantage over her enemies during the present war."

The Institute of Radio Engineers had awarded Taylor the Morris Liebmann Memorial Prize for his "important contributions to radio communications" in 1927. In 1929 he was president of the I.R.E.; and in 1941 the institute awarded him its Medal of Honor. The next year he was honored by the Philadelphia Board of Trade with a John Scott Medal and a prize of money. Taylor is a member of Sigma Xi fraternity, a fellow of the American Physical Society and of the Institute of Electrical Engineers. He is a member also of the American Geophysical Society and the American Association for the Advancement of Science. The elderly physicist is described as slight and baldish, and as "still working at top speed to improve radar." One thing he would like to do something about is making the radar beam curve with the earth so that its low-level usefulness may continue beyond the horizon line. Another of his postwar projects is to send straight-line radar impulses to the moon.

TAYLOR, LAURETTE Apr. 1, 1884- Actress

Address: b. c/o Harry Davies, 701 7th Ave., New York City

As if with one accord, reviewers of *The Glass Menagerie* wrote the word "magnificent" in 1945 in describing Laurette Taylor's interpretation of a former Southern belle who has become a frowzy but fiercely ambitious mother. "A really magnificent performance," wrote Wolcott Gibbs (the *New Yorker*)—"The magnificent art of her performance is all but incredible," said Lewis Nichols (New York *Times*)—these were two exclamations. When one critic compared Miss Taylor to the great Duse, Wilella Waldorf (New York *Post*) promptly asserted that she was "too interesting to be compared to anyone." And later in the season the members of the Drama Critics Circle unanimously accorded the star the award for best actress of 1944-45. Those of her own profession were equally enthusiastic. The second annual Donaldson Award for outstanding achievements in the theater, decided by a poll of 2,000 theater people, gave Miss Taylor the largest number of votes in any category. A star in 1910, she is one of the few actresses to have been equally successful in youthful and mature parts, in comedy and tragedy.

The actress was born April 1, 1884, in New York City, to James and Elizabeth Cooney. A Roman Catholic, little Miss Cooney on her confirmation added Magdalene to her baptismal names of Helen Laurette. "It was intended to be Margaret, not Magdalene at all," the actress says, "but I was an imp as a little girl . . . and quite a ham, too. Those colored pictures of Mary Magdalene with her long golden hair in repentant postures had been too much for me. I didn't bother about what made her so tragic; all I knew was I wanted to be like her, so when I was confirmed, I took the pen and, when I was sure nobody was looking, wrote 'Magdalene' and let 'Margaret' slide." The "ham" of those early years expressed itself in recitations of "The Curfew Shall Not Ring To-Night," and other favorites. The little girl was featured in school entertainments and at twelve was commanding five and ten dollars a performance for semi-professional appearances. It was but a step to her debut as "La Belle Laurette," child impersonator, in a small-time vaudeville house at Gloucester, Massachusetts. Her repertoire included imitations of Eddie Foy, Anna Held, George M. Cohan, and other "old reliables" of that era. Not a success as an impersonator, at the age of fourteen she returned to school.

Miss Cooney made another vaudeville appearance as La Belle Laurette, at the Boston Athenaeum in 1903, when she was nineteen; and before the year was out she was launched on her career as a dramatic actress with the title role in *The Child Wife*. For her second role in the theater, she was cast in that epic melodrama of the "ten-twent'-thirt'" theater, *From Rags to Riches*, also in 1903. The author, Charles A. Taylor, the "king of the mellers," who was twenty years older than the young heroine, fell in love with her, and they were married. The new Mrs. Taylor became Miss Taylor on the stage. She and Charles Taylor (from whom she was divorced in 1910) had two children, Marguerite and Dwight. (Dwight Taylor, a Hollywood writer since 1930, has written, among many screen plays, the successful *Gay Divorcée, The Thin Man Goes Home*, and *Conflict*.)

A Western tour of *From Rags to Riches* brought the Taylors to Seattle, where they established their own stock company, with Laurette as the leading woman. Added to the usual stock company plays of that period—*Uncle Tom's Cabin, Camille*, and *Faust*—were melodramas by Taylor. In the soubrette roles, which were a part of the time-worn pattern of the "mellers," Laurette Taylor not only provided the comic relief but on occasion substituted something more human for her husband's stilted lines—for the actress was outgrowing the sentimentality and staginess of that type of play. After two years a nervous breakdown interrupted her stock-company grind. And though her illness forced her to spend two months in a hospital, later she came to regard it as an escape—it brought her to New York City. However, before making her bow in the more sophisticated Broadway plays she appeared in another Taylor melodrama—*Yosemite,* a Shubert production which toured Eastern cities and played in Chicago. A Buffalo critic observed that Miss Taylor was "charming, graceful, and unique." The year was 1908. It was shortly after this that Taylor went to Alaska to establish another stock company while Laurette began a long trek of job-seeking on the Great White Way. "I was shabby, I was anxious—and an actress should never look either," says Miss Taylor of her struggle to establish herself in the Broadway theater.

There was one failure before she began her triumphant journey to stardom. Cast as Jolan in *The Devil* (1908), a part which had been originated by another, Miss Taylor again failed as an imitator. She was discharged during rehearsal because she was unable to interpret the part as her predecessor had. Her first Broadway role was a minor one in J. Hartley Manners' play, *The Great John Ganton* (1909). However, the part had one big scene and the newcomer, playing it "naturally but with force and finesse," won the critics. It is significant that one reviewer announced that "the fine quality of her histrionic intelligence and imagination, her power to communicate moods amounts to genius." The Shuberts placed Miss Taylor under a three-year contract. *The Ringmaster* and *Mrs. Dakon,* two Shubert productions of 1909, increased the actress' prestige but failed as plays.

The Girl in Waiting (1910), although far from being a successful play, gave Miss Taylor star billing, and also marked the growth of a new friendship that was later to result in her second marriage. One of the most successful Broadway playwrights of that period was J. Hartley Manners, a handsome Englishman who was an established actor on the London stage before he made his American debut as Lily Langtry's leading man in *The Crossways* (1902), a play the two stars had written in collaboration. Miss Taylor and Manners were married in 1911. To Manners she has given much credit for her mastery of the technique of acting, Manners having been a director as well as a playwright.

Miss Taylor's first substantial success came as Rose Lane in *Alias Jimmy Valentine* (1910), a play adapted by Paul Armstrong from an O. Henry story. Although the distinguished H. B. Warner played the title role it was Miss Taylor who received the greater praise from the critics. Following a year's run in New York and on the road the star appeared in the short-lived *The Seven Sisters* (1911), a play translated from the Hungarian. Another major success for the actress was as Princess Luana, a Madame Butterfly type of role, in Richard Walton Tully's *The Bird of Paradise* (1912). The high point of this part of her career, which might be called the soubrette or ingenue period, was reached in Manners' *Peg o' My Heart,* which Miss Taylor called her husband's wedding gift. It won her international stardom and made them both financially independent.

Lucas-Pritchard
LAURETTE TAYLOR

Opening on Broadway in December 1912, the play broke all records by playing 603 performances. After a successful road tour Miss Taylor made her London debut in 1914 as Peg, the Irish-American colleen from Brooklyn. "The most delightful actress America has sent us" in "the most delicious play of all the ages," were comments in enthusiastic reviews which greeted the star and play. It became one of the fourteen plays in London's theater history to run more than 700 performances, and there were successful revivals in 1916, 1918, and 1920. There was, however, some unfavorable criticism of the play: One critic pronounced it "stilted and, when Miss Taylor is not on the stage, a ridiculous play."

Although Miss Taylor appeared in ten or more of the twenty-two plays written by her husband, none ever approached the popularity achieved by *Peg.* Among the more important of these was *The Harp of Life* (1916) which, with Lynn Fontanne '41 and Philip Merivale in supporting roles, played 136 performances on Broadway. *Happiness* (1917), developed by Manners from a one-act play of the same title, caused Charles Collins (Chicago *Evening Post*) to announce in a valedictory to Miss Taylor at the end of her Chicago run that he had been converted from a "hardened dramatic reviewer into an idolater." Capable of "the most poignant tragic acting . . . she is the most interesting creature that now walks on the American stage."

It was in Manners' *One Night in Rome* (1919) that the star played her first serious role. Burns Mantle '44 hailed the play as the best of Manners' works and Miss Taylor's acting the most satisfying of her career. *The National Anthem* (1922) won from Alexander Woollcott '41 the tribute of being good, direct, vigorous drama brilliantly played by Miss Taylor. George Jean Nathan '45, on the other

TAYLOR, LAURETTE—*Continued*

hand, was of the opinion that Manners' contribution to the success of his plays was negligible—that it was Miss Taylor's talent that invested them with those qualities that made them distinguished. Other memorable performances of the actress' career include Sarah Kantor in Fannie Hurst's *Humoresque* (1923), Young Pierrot in *Pierrot and the Prodigal* (1925), and Rose Trelawny in *Trelawny of the Wells* (1925).

A vulnerable spot in the star's career proved to be Shakespeare. At a matinee in April 1918 she appeared with a distinguished cast in leading scenes from *Romeo and Juliet, The Taming of the Shrew,* and *The Merchant of Venice.* The consensus of the critics was that Miss Taylor's Katharine was "vulgar," her Juliet "too coquettish," and her Portia "too prosaic." In the New York *World,* in reply to her critics, she protested "against inclosing Shakespearean characters in rigid molds of precedent, to which all interpreters are supposed to adjust themselves." Her interpretations, she said, had been "modern." "If you are to make a family Bible of Shakespeare," she continued, "do so by all means. But put him on the parlor table and don't put him on the stage."

The death of Manners in 1928 ended a marriage which had been called "a perfect union." After twenty-five years of uninterrupted activity in the theater, she retired and did not appear again for four years. Then her revival of two of Sir James Barrie's plays, a condensed version of *Alice Sit-by-the-Fire,* and his one-act *The Old Lady Shows Her Medals,* won hosannas from the critics. Her transition, on the same evening's bill, from the cultured young mother of *Alice* to the elderly Cockney charwoman in *The Old Lady* was made "with the ease that stamps one who loves her art. She is superb in both roles," Benjamin De Casseres wrote. She repeated the bill thirty-two times on Broadway before she again went into retirement, although in 1934 she appeared in a tryout of a play from her own pen, *At Marian's,* in the Ogunquit, Maine, summer theater, and in 1938 she played on the straw-hat circuit in *Tomorrow's Sunday, Mary, Mary, Quite Contrary,* and *Candida.*

In December 1938 Miss Taylor returned to Broadway as the "charlady" in a revival of Sutton Vane's *Outward Bound.* As excellent as Beryl Mercer's interpretation of that role had been in the original production, "it did not equal Miss Taylor's, which in subtlety, pathos, and power has rarely been equaled on any stage."

Notwithstanding the high praise given her, the star did not return to Broadway for four more years. There were offers from producers but most of the parts, says the actress, "were terrible old hags." When she read Tennessee Williams' *The Glass Menagerie* she knew Amanda was the part for her. "One of the ways I judge a play," said Miss Taylor in an interview, "is whether I can see things about the people in it that aren't in the lines—bits of their lives. . . .If I can, I know the play has substance. I learned that from Hartley." In *The Glass Menagerie,* which has been called a character sketch without much plot, Miss Taylor plays a shabby-genteel Southerner whose anxiety to marry off her crippled daughter (played by Julie Haydon) and set right her discontented son (played by Eddie Dowling) leads her to nag them both incessantly. Burton Rascoe called them three "creatures caught in the most ordinary but most terrible of tragedies —that of trying to live when they have no sensible reason for living," and described Miss Taylor's Amanda as "a simple, sanely insane, horrible mother, pathetic and terribly human and terribly real. She succeeded in destroying every vestige of hope and beauty and joy in the lives of the two people who loved her, her son and her daughter." Laurette Taylor herself sees the matter differently: "She nags her children, but it's because she wants to pull them out of their poverty. She loves them. For them she has strength and tenacity. And I don't believe our play ends as unhappily as some people tell you it does. Why, with a mother like Amanda that daughter is going to get a chance in life somehow. By hook or by crook, Amanda will see to it. Besides, the girl has found that she can dance and she's been kissed. She's lovely. She'll dance and be kissed again."

When the play opened in Chicago on Christmas Eve 1944, the critics were enthusiastic, but the public stayed away for several weeks. Finally, however, the critics succeeded in "hypoing" public interest and *The Glass Menagerie* was still playing to crowded houses when producer Eddie Dowling decided to bring it to New York in time to become a candidate for the Pulitzer and Drama Critics awards. Tennessee Williams won the Critics Award on a divided vote, whereas the vote for Miss Taylor was unanimous. Several of the reviewers agreed that "without the magnificent art of Laurette Taylor it might not seem the marvelous and memorable play that it is."

During the heyday of her fame and celebrity the star is said never to have forgotten friends of humbler days. At every social event given by her and Manners the numerous Cooney clan was not only well represented but "well up in front" at the gathering. Her charm and vivid imagination are said to be distinctly Celtic. She is titian-haired, with "eyes like brown pansies," a figure more rounded than in her younger days but still "on the good side" for her five feet five inches. As of 1945, she has never acted before the camera, and her only appearance on the radio was a memorial program honoring President Roosevelt '42. Her chief interest, other than the stage, is in writing. Her play *Enchantment,* which came near production in 1933, has been revised, and Billy Rose '40, on George Jean Nathan's recommendation, is considering it. In July 1945 Miss Taylor finished another play, *Fun With Stella,* as well as the draft of a book, to be called "Stars That Have Crossed Mine," a book "more about people I've met than about me," Miss Taylor said in an interview. To this she added, "If I can prove to be a successful writer I'm not going to act any more."

Who's Who in the Theatre, 1939

TEMPLE, SHIRLEY Apr. 23, 1928- Motion picture actress

Address: b. c/o David O. Selznick Productions, Culver City, Calif.; h. 227 N. Rockingham Rd., Brentwood Hts., Calif.

A star at five, a leading box-office moneymaker at seven, a retired millionaire at twelve, "professionally reborn at seventeen"—such is the record of Shirley Temple, America's most famous child actress.

Shirley Jane Temple was born in Santa Monica, California, on Shakespeare's birthday, April 23—the year was 1928, not 1929 as Twentieth Century-Fox's original publicity stated. Her parents were bank clerk (later bank manager and business counselor) George Francis Temple, a native of Pennsylvania and a resident of California since 1903, and Chicagoan Gertrude (Creiger) Temple. Shirley was the third child—the Temples already had two half-grown sons. "She looked like a little dancer, even as a baby," Mrs. Temple reminisces. When Shirley began to walk at the age of one, she walked on her toes, Mrs Temple says. "From the time she took her first step, she ran on her toes, as if she were dancing." But dancing lessons, the fulfillment of Gertrude Temple's hope that her daughter could have the instruction she herself had been denied, were merely a part of Shirley's general education, and began in 1932 when she was about four. Hollywood, although only ten miles from Santa Monica, was then far from her parent's thoughts.

Hollywood, specifically Educational Pictures, was well aware, however, of the possibility of latent talent in dancing school children, and in 1932 sent director Charles Lamont to Shirley's neighborhood school as a talent scout. The official account of Shirley's first encounter with the movies states merely that the reluctant Mrs. Temple was persuaded to let her four-year-old daughter perform for Lamont, that Shirley did what she was told, and that Lamont, in due course, selected her along with several other children for a screen test. Shirley's story is that she hid under the piano at Lamont's approach. "He stood around for a while watching," she says, "and then he said, 'I'll take the one under the piano.'" Somewhat skeptical about a movie career for their daughter, George and Gertrude Temple were scarcely pleased when the company telephoned three days later, but finally agreed to a screen test to see how Shirley would photograph. The pictures to be made were *Baby Burlesk* short subjects intended to satirize important feature films. Because the first of these, *War Babies,* was a comic miniature edition of *What Price Glory,* the first words Shirley uttered before the cameras were in French. "Oui, mon cher," she spoke into the microphone overhead before she answered Lamont's questions about her pets and dolls and the little playhouse in the backyard—while, unobserved, the cameras were recording the scene.

In the next twelve months Shirley played in seven of these one-reelers, earning approximately three hundred dollars. A few bit parts in full-length pictures, such as *Red-haired Alibi* and *Out all Night,* also came her way, and Zasu Pitts, then at the height of her career, prophesied a shining future for the budding star. In the spring of 1933, however, the studio terminated the *Baby Burlesk* series because the children were growing too large. (Shirley herself was nearly forty inches tall, four inches taller than the desired thirty-six.) When Educational Pictures asked for Shirley's services again at the end of the summer, Shirley joined the cast of the two-reel *Frolics of Youth.* Meanwhile, Mrs. Temple also took Shirley to answer the Fox call for several children to do a singing and dancing number in George White's *Scandals.* While nothing ever came of this studio idea, the interview served to introduce Shirley to assistant director Leo Houck of Fox, who already had his eye on the child, and who was to give Shirley her chance. It was at a preview of the second of the *Frolics of Youth* that Houck introduced the Temples to Jay Gorney, the song writer, who was seeking a child to play the part of James Dunn's daughter in the Will Rogers-Vincent Sheean '41 musical *Stand Up and Cheer.* Shirley was taken to Lew Brown, the discoverer of Jackie Coogan, auditioned, and signed for the part.

Columbia Pictures

SHIRLEY TEMPLE

Filmed in early 1934, *Stand Up and Cheer* provided Shirley with the "Baby, Take a Bow" song-and-dance sequence which, in the opinion of exhibitors, at once established her as "a full-fledged star in her own right." "She's stolen the picture," it is reported that Vincent Sheean had shouted at the preview. And back in his office a short while later he is said to have told Shirley: "You're going to be the most loved little girl in the whole world." But stardom did not come overnight for the child. Fox gave her small roles in two now forgotten pictures, *Now I'll Tell* and *Change of Heart,* released almost simultaneously with *Stand Up and Cheer* in 1934. They next loaned her to Paramount for *Little Miss Marker,* in which she was hailed as "sensational," featured her in *Baby, Take a Bow,*

TEMPLE, SHIRLEY—*Continued*

and then reloaned her to Paramount for *Now and Forever,* with Carole Lombard and Gary Cooper '41. Before the end of the year, however, *Bright Eyes* had made Shirley—now given star billing by Fox—a box-office favorite, and the Academy of Motion Picture Arts and Sciences Award banquet had seen her honored with a special "Oscar" as "the outstanding personality of 1934."

From 1934 through 1939, Shirley Temple remained at the top in box-office appeal—singing and matching Bill Robinson '41 tap for tap in *Dimples* and *Rebecca of Sunnybrook Farm;* singing again in *Curly Top* and *Poor Little Rich Girl;* and interpreting story-book characters in *The Little Colonel, The Littlest Rebel,* and *Heidi.* In Kipling's story Wee Willie Winkie became a girl so that Shirley could play the role. Her popularity was world-wide; in South America she was known as "Ricito de Oro", "Golden Curls." Thousands of fans wrote to her each day. Her salary rose from one hundred and fifty dollars a week to several thousand; for the year 1937 it came to $307,014, the seventh highest income in the country; and she is said to have made more than fifteen times as much from "by-products" like Shirley Temple dolls, advertising, and so forth, as from her acting.

The public and experts alike sought the formula for her phenomenal success. Was it genius? On the Pintner-Cunningham intelligence test—on which an IQ of above 135 is rated "genius"—Shirley had scored 155. Lionel Barrymore '43 characterized her work in *The Little Colonel* as a reasoned rather than imitative performance, and Jack Donahue, her dance director, found himself teaching a little girl who learned dance steps "by ear" without looking at his feet and remembered them for weeks after rehearsals had ended. Was it acting ability? She was "one-take Temple," the child who always knew her own lines perfectly and frequently those of the rest of the cast as well. Amazed at her knowledge of acting technique, Adolphe Menjou had called her an "Ethel Barrymore '41 at four" after the first day's shooting of *Little Miss Marker.* Lyle Talbot, describing a scene in *Our Little Girl,* in which Shirley screams at him, "I hate you!" recalled: "There was something heartbreaking in the emotion she displayed—half rage, half childish dismay. She made the scene so real with her little eyes flashing and her baby's voice breaking with rage, that the entire troupe was impressed, and very quiet, when the scene was finished." In *Captain January,* when the script called for her to tap dance down a forty-five-foot lighthouse stairway, delivering a line at each turn of the stairs, Shirley, to everyone's astonishment, did it the first time with perfect timing. Was it personality? From the time that James Dunn, who played with her in four pictures, credited Shirley with a new influence for good in his life, all who knew her pointed out the readily flashing smile, the alertness and responsiveness, which set apart the little girl. However, like other children, she made mudpies, raced her tricycle, listened to *Gang Busters,* and sent in her boxtops for make believe detective badges.

But work before the cameras—more play than work to Shirley—consumed no more than three hours a day, in accordance with California laws. Three more hours constituted Shirley's school day, dictated by these same regulations and provided for in Shirley's contract. While the Los Angeles Board of Education supplied the books, supervised the curriculum, and assigned the teacher, Twentieth Century-Fox paid the teacher and furnished the schoolhouse. "School" was held in Shirley's bungalow on the studio lot or in a trailer schoolhouse which followed Shirley for the day, the teacher clocking her in and out to make certain that she received her full three hours of instruction daily. Such irregular lessons did not trouble Shirley, however, declared her teacher, who had been authorized by the Child Labor Board to halt production if Shirley's welfare were endangered. "Shirley possesses marvelous powers of concentration," she said. "She throws herself into a scene for all she's worth, then instantly centers upon her studies the moment she sits down at her table." She learned about China when making *Stowaway* and about India while acting in *Wee Willie Winkie,* and picked up part of her arithmetic as she operated the cash register of a make-believe grocery store. French by the conversational method, dancing, and piano were also part of her education. At night there were the next day's lines to be learned with her mother—who was paid a reported several hundred a week by the studio to be Shirley's private director and coach and who has generally been considered responsible for Shirley's screen success.

The first sign that Little Miss Marker was growing up came in 1938, when Shirley made *Rebecca of Sunnybrook Farm*—her mass of curls was parted and tied back. Although her name still made headlines when that spring she crossed the country on a vacation trip, thereafter both her publicity and her box-office drawing power began gradually to decline. Partially withdrawn from pictures in 1939 in order to have the companionship of other girls at a nonprofessional school, Shirley scored only minor successes in her next films. Then, in 1940 *The Blue Bird,* based on the Maeterlinck fantasy, failed to make a profit, and the studio, as Jack Oakie put it, gave "the kid who had coined millions for the industry . . . a chill to go down in movie history." Fox maintained that Shirley had merely lost her appeal, but Mrs. Temple blamed the unvarying Cinderella themes of the Temple vehicles, and in 1940, after *Young People* had been filmed, bought Shirley's release from the remainder of her contract. Eight months later schoolgirl Shirley was again under contract—this time to MGM. After making *Kathleen* on loan to Edward Small in 1941 and *Miss Annie Rooney* for her new home studio in 1942, and starring on a radio program series, Shirley again retired—to emerge in 1944 under the aegis of David O. Selznick '41. But *Since You Went Away,* with Claudette Colbert '45 and Jennifer Jones '44, and *I'll Be Seeing You,* with Ginger Rogers '41 and Joseph Cotten '43, afforded the former child actress only minor roles, which were not considered an index to her capabilities.

(She did, however, receive two citations for her work on the former film.)

A real test of her ability was left for *Kiss and Tell*, Shirley's first starring vehicle in three years and a comedy in which Hollywood previewers hailed her as Selznick's biggest potential money-maker. Reviewers were enthusiastic about the picture. Wrote Bosley Crowther in the New York *Times*: "You've got to hand it to Miss Temple—she's superb in the leading role, a compound of girlish innocence and female perversity. The leap from her former saccharine didoes into this mildly terrifying 'teen-age' role is one that required uncommon talent. The lady has got it—plus looks." "Miss Temple is quite extraordinary," was Howard Barnes's comment in the New York *Herald Tribune*. "She is as aware as she is adult in a new phase of acting." Shirley Temple's next role will be in *Suddenly It's Spring,* opposite Joseph Cotton.

Besides her film and school work, Shirley Temple found time to prepare her autobiography. It was published in October 1945 under the title *My Young Life*. On the whole, reviews were favorable: The Chicago *Sun*'s *Book Week* observed that "there is much of the pertness and sureness of the Temple personality in the story and several of those chuckles and humorous touches that put the 'Baby Bernhardt' ahead of all rival screen moppets." A reviewer in the New York *Herald Tribune* pointed out that "her personal comment is friendly and commendably untemperamental, and her language a happy medium between adult English and that widely used by her generation."

The Shirley Temple who was graduated from the Westlake School for Girls on June 13, 1945, and who on September 19, 1945, was married to Sergeant John Agar, Jr., of the Army Air Forces, son of the late Chicago packer, has been described as "just like the girl next door—provided, of course, you live in heaven." At the New York *Herald Tribune* Forum in 1945, she said that she regards motion pictures as "the biggest single factor in shaping young minds" and considers them a potent force for the spread of democratic concepts in former Axis nations. They teach by example, she has also said, and have made history, geography and even the absorption of moral concepts an interesting and exciting experience. Motion pictures, Miss Temple predicted, will largely replace books in future educational programs, and particularly fairy tales usually read by young children. She considers her years in the studios as having given her an object lesson in democracy in the give and take of picture-making. Now a slim five-foot-three with reddish-gold hair, brown-eyed Miss Temple enjoys horseback riding, badminton and swimming, and calls herself a born collector—of autographs, knickknacks, and the dresses from her baby pictures.

TENNANT, WILLIAM GEORGE Jan. 2, 1890- British naval officer

Address: b. c/o The Admiralty, London; h. The Eades, Upton-on-Severn, Worcestershire, England

Until June 1944, in the fifth year of the Second World War, the Americans and British had been coping with the herculean task of transporting and landing the huge tonnage of equipment necessary for fighting a modern war of machines on foreign shores. Not until they planned for the invasion of the Continent, however, did they face their greatest test. To meet the stupendous problem of disembarking men and gigantic stores of material on the beaches of Normandy with a maximum of speed, American and British engineers and technicians conceived the ingenious idea of fabricating harbors—constructed in sections—which they could tow across the Channel and set up on the French coast. One of the experts responsible for this feat was Vice-Admiral William George Tennant, a navigation specialist who helped in the planning and was in operational control of the undertaking.

William George Tennant was born January 2, 1890, the son of Lieutenant Colonel E. W. Tennant of Upton-on-Severn, Worcestershire. At the age of fifteen young William became a midshipman on the training ship *Britannia,* and after completing the required five years of professional and general education he received his commission as a sub-officer in the British Royal Navy. As a lieutenant of twenty-three he later entered Portsmouth to take advanced courses in navigation. Upon completion of this two-year course he was posted for duty in the Dardanelles as navigation officer in H.M.S. *Chatham*. Shortly afterward, while serving in the cruiser *Nottingham*, the young officer participated in the most important naval engagement of the First World War, the 1916 Battle of Jutland that destroyed the German threat to British naval superiority. The cruiser survived this battle, in which England suffered great material losses, but three months later she was torpedoed by a German U-boat in the North Sea while Tennant was still aboard.

For the next decade Tennant served in several battle cruisers, including the famed *Renown* and her sister ship, the *Repulse,* which he was to command in the Second World War. In 1925 the thirty-five-year-old officer was promoted to the rank of commander, and in 1932, having completed the two-year course at the Staff College, Greenwich, he was given his captaincy. After a year's course (1934-35) at the Imperial Defence College, Tennant was placed in command, as flag captain and chief staff officer, of the new cruiser *Arethusa*, a ship in the Third Cruiser Squadron. Transferred to shore duty in 1937, he was next an instructor for two years at the Imperial Defence College.

At the outset of the war in Europe in 1939 Captain Tennant was at the Admiralty, serving as chief staff officer to the First Sea Lord, the

British Official Photo.

VICE-ADM. WILLIAM GEORGE TENNANT

late Admiral Sir Dudley Pound '41. Less than a year later he was participating in the Dunkerque evacuation, as beachmaster. On May 26, 1940, he had been sent to Dover, with two hundred officers and ratings, to take part in what was then called "Operation Dynamo." On the order of Vice-Admiral Ramsay '44, Tennant and his party had proceeded to Dunkerque, under heavy fire, to investigate possible areas of embarkation from a coast known for its treacherous shoals. Tennant had reported back that a narrow mole or breakwater running out from the harbor could be used for removing the troops, and on this report evacuation plans were organized.

As senior staff officer ashore Tennant worked with his men on the beach throughout the subsequent operations, directing the evacuation under a rain of German bombs. Dunkerque was a defeat for the Allies, but it has been considered one of the most efficiently executed operations of its kind. On June 6 Captain Tennant was created a Companion of the Bath, "for good services in organizing the withdrawal to England, under fire and in the face of many and great difficulties, officers and men of the Allied armies . . . between May 27 and June 4."

Shortly afterward, Tennant was put in command of the 32,000-ton battle cruiser, the *Repulse*, and he commanded her until that fateful day in December 1941 when she was sunk in the South China Sea by Japanese torpedo planes and dive bombers—in the first action the ship had seen since the start of the war. Cecil Brown '42, the American correspondent, was aboard the *Repulse* at the time of the sinking, and he has written a full and graphic account of it in his book *Suez to Singapore* (1942). The cruiser, accompanied by what Tennant called the more "glamorous" *Prince of Wales* and by four destroyers, had left Singapore December 8—before the radio had brought word of the attack on Pearl Harbor—on a four-day assignment. "We are off to look for trouble," wrote Tennant to the ship's company. "I expect we shall find it. . . .We are going to carry out a sweep to the northward to see what we can pick up and what we can roar up. We must all be on our toes."

On the morning of December 10 they found the "trouble." A Japanese landing on the Malayan coast, a hundred and fifty miles north of Singapore, had been sighted, and, although already spotted themselves by enemy reconnaissance, the small British force had turned westward to encounter the Japanese ships. Shortly before noon the attack came—from enemy aircraft—and in a little over an hour both the *Prince of Wales* and the *Repulse* were sinking, hit by torpedo bombs. Almost at the end, Brown reports, the officers and men of the bridge were forced to push Captain Tennant into the sea because he refused to leave his ship of his own volition. The men of the two ships were rescued, after a short period in the water, by the destroyers which had escaped destruction, and taken back to Singapore.

Two months after this action, in February 1942, Tennant was promoted to rear admiral and placed in command of a cruiser squadron in the Eastern Fleet. (In April Admiral Sir James Somerville '43 was named commander of this fleet.) This was an important assignment for Tennant, in the face of the continued strength of the Japanese in the Pacific, and, indeed, the next two years were to be difficult ones for the Allies. Striking down from Thailand, the Japanese slashed through Malaya, captured Singapore that February, pressed on through Burma; farther East they took Java and Sumatra in the late winter and spring. That April the Admiralty announced that during the first part of the month England had suffered serious losses in the Bay of Bengal off the coast of Ceylon, when Japanese carrier planes had sunk two cruisers and an aircraft carrier. In addition, nearly all the torpedo planes, fighters, and bombers engaged in an attack on Japanese ships off the naval base of Trincomalee had been shot down or damaged.

With the Japanese now supreme in the Indian Ocean, the British, in order to forestall an attack from Ceylon on Madagascar, in May seized Diégo-Suarez, the naval base on the French island off the coast of eastern Africa. (The British forces were led by General Francis W. Festing '45.) The Germans made advantageous use of the areas left under the control of the Vichy Government, however, and this prompted the British later in the year to send Admiral Tennant, as joint commander with General Robert Grice Sturges, to effect a second invasion of Madagascar. Part of the troops disembarked on the west coast of the island and worked their way inland, while another column advanced south from the British-held region of Diégo-Suarez. The campaign was successfully completed in less than two months, and Admiral Somerville has paid tribute to Tennant for his skill in conducting the operations.

By the end of 1943, with the Allied invasion of Europe in the offing, Tennant was recalled from his sea command (from January to November he had been second-in-command of the Eastern Fleet under Somerville), and was made responsible for the operational control of prefabricated harbors, to be used in the imminent landings on the Continent in June 1944. The scheme had been decided on by the British and American commanders at a meeting in London in June 1943, and approved at the Quebec conference. Later detailed proposals had been submitted to the Combined Chiefs of Staff in Washington in September, and in November, with the blueprints completed, Tennant had been put on the job.

The fabricated harbors each consisted of several components: the "mulberry," of British design and the most impressive portion of the harbor, was a three-thousand-foot floating bridge; the "phoenixes" were the breakwater sections; and the "lobnitz" piers were the floating piers which were raised on giant steel columns or stilts. In addition, there were thousands of feet of floating bridges. In its entirety, the harbor gave the impression of a "vast walled city floating on the water." About one hundred and fifty "phoenixes," twenty "lobnitz" piers, and twenty thousand feet of floating bridge were towed across the Channel for two ports—one built by the Americans and one by the British—and assembled on the French coast. The wharf of the British prefabricated harbor on the Normandy coast consisted of seven "spud pierheads" or steel pontoons, displacing a thousand tons. Each pierhead was a complete "ship," with crew quarters and pier roadways leading to the shore.

At Admiral Tennant's suggestion, blockships were sunk off the beaches to provide immediate shelter in the unlikely event of a northerly gale's springing up during operations. General Dwight Eisenhower '42 had had the choice of two dates from which to chose the day of the Normandy invasion, the weather expert having offered June 6 or June 19. The date the General chose is now history, but the invasion might have been an historic disaster if Eisenhower had decided on the latter. The worst storm in eighty years struck the Channel in the afternoon of the nineteenth and raged for three days. Although the towing job was over by then, the storm cost the Allies five days, during which time they could not unload any supplies.

The British harbor during this time was protected by a shoal and thus remained intact, although damaged in part by some five hundred landing craft and small boats, "which tossed like chips and bounced into wreckage on the steel structure and the beachheads." The American harbor, less sheltered from the gale, was largely destroyed. It was decided, therefore, to repair the British port with some of the salvaged parts from the American-made one, and to extend, strengthen, and double-bank the American blockship breakwater so that it could be used as a shallow-water harbor. At these two ports were deposited many thousands of tons of stores upon the French shore.

Five months after the invasion Tennant said, "They have done their job. One day now, along will come a normal winter gale, and that will be the end of it all." In November Tennant became naval commander in the Levant, with acting rank of vice-admiral.

Tall and thin, with graying hair, Admiral Tennant, according to Cecil Brown, has "an open pleasant face, pinkish, smooth skin with wrinkles around the eyes." In 1919 he was married to Catherine Blount, the daughter of a British Army officer.

TEYTE, MAGGIE (tāt) Apr. 17, 1889- Concert singer

Address: b. c/o Austin Wilder, 745 Fifth Ave., New York City

Setting a record by having two concerts sold out within hours of their announcement, English lyric soprano Maggie Teyte, the first European artist to visit the United States since V-E day, took New York musical circles by storm on October 31, 1945, in a welcome which one reviewer irreverently compared to a Sinatra reception. Miss Teyte, who is considered the foremost living interpreter of modern French songs, was making her first appearance in New York since the early 1920's.

Maggie Teyte was born Margaret Tate on April 17, 1889, near Wolverhampton, Staffordshire, England. Of English-Irish-Scotch extraction, she is the daughter of a hotel owner, an amateur pianist; and her mother was a singer. Miss Teyte received her formal education at St. Joseph's Convent in Wolverhampton, where she had what she calls the usual training. She does not remember when she first began to sing, but at the age of twelve it was recognized that her voice was of unusual quality, and her parents decided to send her to the Royal College of Music. Although Sir Hubert Parry at first refused to accept the application because of her extreme youth, the talented young singer was finally admitted to the college, where she studied piano and voice until she was fourteen. Then in 1903, notes *Opera News*, when she sang Tosti's "Goodbye" at a church fete in London, she so impressed Walter Rubens, a musical patron in the audience, that he raised a purse among his friends to send the girl to study with Jean de Reszke, the noted Metropolitan tenor who in 1902 had settled as a teacher in Paris. At the audition De Reszke predicted a brilliant career for Miss Teyte and immediately took her under his wing. It was at his suggestion, too, that she changed the spelling of her name at her debut so that French audiences might have no difficulty with its pronunciation.

The musical foundation which in 1945 still causes critics to marvel at her voice, Miss Teyte says she owes solely to De Reszke. "I studied voice production only with De Reszke," she told Noel Straus of the New York *Times* in 1945, "and I form my tones today according to the identical precepts of his that I followed at my debut. He had a real method of his own, taken from many sources and singularly free from complications. It was based on a dozen exercises, every one for a special purpose, which covered every phase of vocalism. One exercise, which I practiced daily, afforded complete mastery of pianissimo singing and consisted of a passage from the Queen's aria from the last act of Verdi's *Don Carlos*. Another exercise enabled me to sing Brünnhilde's 'Ho-yo-to-ho,' from *Die Walküre*, like a dramatic

MAGGIE TEYTE

soprano, though I knew I would never use music of that type in public." Special stress was laid on Mozart by De Reszke, and by Reynaldo Hahn, Venezuelan-French composer and conductor who coached her in dramatic routine, but she also had to learn every important coloratura aria in the operatic repertory.

Miss Teyte made her first public appearance at the age of seventeen as Zerlina in a concert version of *Don Giovanni* given at a Mozart festival in Paris under Reynaldo Hahn's direction. She next appeared with Paderewski at a concert in Monte Carlo. In February 1907, with the Monte Carlo Opera Company, she made her official debut, again as Zerlina, under the direction of Hahn. Two years, during which she sang minor roles, followed at the Opéra Comique, until on June 12, 1908, she excited Paris with her interpretation of Mélisande in Debussy's *Pelléas et Mélisande*, a role which Marguerite Carré had insisted Miss Teyte take when Mary Garden left for the United States. Of this performance the critic of the Paris *Temps* wrote: "Miss Maggie Teyte took it upon herself to teach them that youth, grace, a pure and supple voice of a soft and melodious timbre, could accomplish wonders. . . .She added to Maeterlinck's drama an entirely new charm, and enriched the poetry of Debussy's music with her loving and tender touch." (Miss Teyte sang the role seventeen times that season.)

For the role of Mélisande Miss Teyte had been prepared by nine months of instruction with the composer himself. An audition with Debussy had been requested for her by De Reszke, and the story of the little girl in pigtails whom Debussy refused to identify with Miss Maggie Teyte until he had heard her sing is famous. She worked with Debussy on both the opera and his songs three hours each day. "No other song composer," Miss Teyte is quoted by Noel Straus on Debussy's methods, "has marked his lyrics with so many definite and detailed indications of his intentions, and he insisted that one and all of them be meticulously heeded. Every note had to be given its exact time-duration, even in measures that in other composers might be considered rhythmically rather free. And each slightest stress and other marking had to be positively observed, in order to bring out the true colors of the text."

Miss Teyte made her London debut in October 1909 at a concert in Queen's Hall. She made her first appearance on the London operatic stage with the Beecham '41 Opera Company at His Majesty's Theatre on May 25, 1910, singing Melka in *Muguette*; and in that season she also appeared in *Hansel and Gretel*, as Antonia in *Tales of Hoffmann*, as Blonda in *Il Seraglio* and as Cherubino in *The Marriage of Figaro*. In October of the same year, with the same company, she appeared as Nuri in *Tiefland*, Marguerite in *Faust*, Zerlina in *Don Giovanni* and Mélisande in *Pelléas et Mélisande*. The following year she went to the United States, making her American debut as Cherubino with the Chicago-Philadelphia Opera Company on November 4, 1911, at the Philadelphia Metropolitan Opera House. Two days later, opposite Mary Garden as Prince Charming, she created the role of Cinderella at the American première of Massenet's *Cendrillon*. Other roles with the Chicago-Philadelphia Opera Company during her first American season, were Marguerite and Antonia, Lygia in *Quo Vadis*, Dot in *Cricket on the Hearth*, Mignon, and Mimi in *La Boheme*. On November 16, 1911, she gave her first song recital in New York at Carnegie Hall, and on February 20, 1912, she made her only appearance on the stage of the Metropolitan Opera House in New York in *Cendrillon* under the sponsorship of the Chicago-Philadelphia management.

In the summer of 1913 Miss Teyte toured England and the Riviera, returning in October 1913 to the United States for her third American season in Chicago and Philadelphia. And after March 1914 she again toured England, this time with the Czech violinist and composer Jan Kubelik. She joined the Boston National Grand Opera Company in 1915, remaining with the organization for the next two years and participating in its summer engagement in Paris. In 1917 she began an extensive two-year concert and recital tour of the United States which ended when she returned to England to take leading roles in operetta. At the Prince's Theatre, London, on April 19, 1919, the young singer created the role of Lady Mary Carlisle in the première of *Monsieur Beaucaire*. The operetta had a six months' engagement and was followed by Miss Teyte's appearance for another six months' run, beginning in December 1920, as Princess Julia in Emerich Kalman's *A Little Dutch Girl* at the Lyric Theatre.

As a leading operatic soprano Miss Teyte had been warmly applauded by the critics. As Mimi, said *Musical America*, she "gave a truly touching and absolutely convincing portrayal of that attractive and very unfortunate heroine. She looks the part, dresses the part, and acts the part. . . .It should be added also that Miss Teyte sang the role and did so with plenitude and sweet quality of tone, modulated at all times to the appropriate emotional aspects, and directed invariably by exquisite taste and deep sense of artistic proportions." Her Marguerite, wrote A. Scheinfeld of Milwaukee, "is one of appealing beauty and wistfulness. She sang the role in a voice of peculiar beauty, responding easily to its demands, and invested it with a simplicity, a gentleness and truth, wholly devoid of apparent stage craft." In *Mignon*, wrote the Philadelphia *Public Ledger* reviewer, "Miss Teyte clearly apprehended the distinctive characteristics of Goethe's heroine, her passionate fervor, her wayward, impetuous impulsiveness, her capacity for a self-sacrificing devotion, and she expressed them with a fine sincerity and an eloquently appealing art."

Miss Teyte's concert work was likewise highly praised. "Her voice," wrote the late Richard Aldrich of the New York *Times*, "is an almost startlingly powerful one to come from a person of her diminutive stature. . . .In its best tones, which are heard in her *mezzo voce*, the voice has real beauty, though it has not great range of color and expressiveness. . . .She is a singer of exceeding intelligence, of fine taste and musical feeling, of a commanding temperament that produces results sometimes unlooked for." To Henry Taylor Parker it was "a distinctly French voice . . . . a very bright voice that has been polished into a kind of dry clearness. . . . It falls on the ear much as the light of a very clear, dry, cool, still autumn day falls on the eye. There are glints in Miss Teyte's tones; they are transparent, prismatic, catching many reflections from the music and the mood of the songs. . . . It is a voice for connoisseurs." And the *Ohio State Journal*: "With a voice like a thrush, eyes as roguish as a March wind, and a smile like a breath of spring, in her concert in Memorial Hall last night she revealed a singing art that was a delight, supplemented by a personality as winning as can be imagined. This diminutive prima donna sings as if singing were the best fun in the world, and there is a freshness and spontaneity about the way she does it that makes her most captivating."

Her marriage to W. S. Cottingham in 1921 sent Maggie Teyte into semi-retirement for nine years, although in 1923 she returned for a while to grand opera with the British National Opera Company, to sing in *Hansel and Gretel, La Bohème, Madame Butterfly,* and to create the rôle of the Princess in Holst's *The Perfect Fool* (May 1923 at Covent Garden). Then, in June 1930 she reappeared as Mélisande. In 1932 she toured Australia, established a vocal school in England and joined the British Broadcasting Company as a radio artist. During the Coronation opera season in 1937 she appeared in *Orpheus, Hansel and Gretel, Madame Butterfly* and as Eva in *Die Meistersinger* at Covent Garden, appearing there for the last time as Cio-Cio-San on October 29, 1937. Her favorite roles had been Mélisande, Butterfly, Mimi, Cherubino, and Hansel. During the Second World War she drove ambulances, spent some time in a mechanical school and on the assembly line, and then, forced by an aggravated sinus condition to give up that form of war service, toured army camps throughout England under the auspices of E.N.S.A. and C.E.M.A. (British equivalents of the USO), singing both classic and popular songs.

Miss Teyte is known to the present generation of American music lovers primarily through her recordings of French art songs by Duparc, Chausson, and Fauré, with the pianist Gerald Moore, and especially Debussy, with the pianist Alfred Cortot. Of the Debussy songs she has said: "Though exceedingly *raffiné,* complex and subtle, Debussy was essentially a primitive, one might almost say savage, person. Reticent and a man of few words, he seemed always striving for an unattainable goal with such intensity that he gave the impression of being ill, and like a soul in Purgatory, breathing heavily and never at peace with himself. The widespread notion that Debussy, whose music faithfully reflected his personality, intended his compositions to be projected in a vague, nebulous and primarily atmospheric manner is wide of the mark. A fierce power was basic in his nature. When he played the piano, he infused the accompaniments of his songs with this elemental strength. But it was invariably held in leash. This forcefulness under curb he asked of the singer as well as of the accompanist, and it is a fundamental requirement in the interpretation of his music. His songs demand exceeding warmth of temperament, but ever firmly controlled."

It was with these modern French songs that Maggie Teyte scored a fresh triumph on October 31, 1945, in New York's Town Hall, when after an absence of approximately twenty-five years (which led to the belief that she had died) she returned to America, thus becoming the first European artist to cross the Atlantic since V-E day. Two scheduled recitals (October 31 and December 19, the second later postponed to December 28), her manager reported, were each sold out within one day after their announcement. The audience at the first received her tumultuously, with a welcome, noted *PM*'s Robert A. Hague, beside which "a Sinatra demonstration at the Paramount is a feeble thing indeed." Wrote Jerome W. Bohm, who had attended the concert with misgivings: "Miss Teyte proved beyond dispute that a voice which has been properly produced can be of service even after its owner has passed the prime of life. It was a great pleasure to hear her clearly attacked, firm tones, and her ability to color them to suit the inflection of each and every word of her songs was worthy of great admiration. . . .[She] brought to her interpretations an enkindling imagination, a blending of impassioned musicality and intimate poetic insight which suggested unerringly the widely variegated moods of the songs." Olin Downes '43 found that, "For a lesser artist the evening would have been an unmitigated triumph. For a Maggie Teyte it was something less." But for Robert Bagar "an artist in the great tradition" had returned: "The utterly musical manner of her phrasing, her coloring, her rhythms and rubatos left one a little speechless. . . .Those who believe in music as something to be shared by performer and listener saw last night the ideal exemplification of it Miss Teyte does not merely sing a song; she lives it, acts it when necessary, breathes movement in it by the potent humanity of her understanding." Her second reception in New York, following a tour of San Francisco, Los Angeles, Portland, and Seattle, in which she received ovations such as are rarely heard, was equally enthusiastic.

Maggie Teyte, who is just over five feet in height, is a "sprightly woman with reddish curly hair and blue eyes," who enjoys motoring, golf,

TEYTE, MAGGIE—*Continued*

tennis, and other out-door sports. She has been married twice, to Eugene Plumon and to W. S. Cottingham, and both marriages were dissolved. For her services to French music she was awarded the Croix de Lorraine by General Charles de Gaulle '40. Allene Talmey of *Vogue* found her "a small, quick, witty Englishwoman, with . . . eyebrows that she uses the way the French do their hands. She talks with them. . . .She laughs with a low, crumpled laugh that is not at all soprano. Though her pastel quality, her paleness, her accent are thoroughly English, her crystal chandelier sparkle is pure French." Said the *Opera News* interviewer recently: "The crystalline beauty of Maggie Teyte's recordings, their sublety and restraint should prepare one for the birdlike charm of her personality. But they don't . . . what baffles one is that irrepressible vivacity, the prodigal flow of wit and gaiety, the gestures, the constant *mot juste*. How can a woman past middle life spend herself so generously and still safeguard her classic art? How can a babbling, sparkling brook still keep its depth pellucid?"

THACKREY, DOROTHY S(CHIFF)
Mar. 11, 1903- Newspaper publisher

Address: b. 75 West St., New York City; h. 133 E. 64th St., New York City

At the helm of New York City's oldest daily newspaper, the *Post*, is Mrs. Dorothy S. Thackrey, its owner since 1943. One of the few women newspaper publishers in the United States to own a metropolitan paper, she has expanded her interests by acquiring a New York community paper and three radio stations, and by establishing a European edition of her paper in Paris. The publisher has also given much of her time to social welfare and civic work.

A grandchild of Jacob Schiff, philanthropist and founder of the banking house of Kuhn, Loeb and Company, Dorothy Schiff Thackrey is the daughter of Mortimer and Adele A. (Neustadt) Schiff. Born to wealth, in New York City on March 11, 1903, she was educated at the fashionable Brearley School in that city; and she spent much of each year traveling abroad with her mother. In 1920, at the age of seventeen, she entered Bryn Mawr College, but upon the completion of her freshman year, she says, she was told not to return because her grades were too low. She therefore studied alone, concentrating on history, psychology, horticulture, stenography, and cooking. In 1921 Miss Schiff was introduced to society, and two years later she was married to Richard B. W. Hall, a broker. (Divorced from her husband in 1931, she was married to George Backer; and following a second divorce, she became the wife of Theodore Olin Thackrey in 1943.)

In 1931, following her divorce, Mrs. Thackrey first entered the social service field. As a member of the Social Service Committee of Bellevue Hospital for four years, she gained an insight into the plight of the poor. The work of the committee, says Mrs. Thackrey, "was a sincere attempt to help, but of course it seemed a pretty feeble effort. It seemed to me that what we were doing was simply putting a little salve on the sore; not curing the disease." While in Florida that year, she was told by George Backer (who became her husband) that a lunch club was being formed in New York to provide noon-day meals for girls who were looking for employment. Enthusiastic about the plan, upon her return to New York she became one of the sponsors of the club, which functioned for several years during the thirties.

A stanch Republican, Mrs. Thackrey nevertheless began to question the policies of her party during the years of President Roosevelt's '42 first term. In early 1936, already a member of such organizations as the Women's City Club, the League of Women Voters, and the Women's Trade Union League, she joined the School of Politics of the Women's National Republican Club to study more closely the tenets of the Republican Party and its criticism of the New Deal and the Roosevelt Administration. After viewing the unemployment situation from both Republican and Democratic angles, she arrived at the conclusion that "the Administration was trying to solve this problem in an honest, sane, American way" through Government intervention.

If she was still undecided as to whether or not to bolt the Republican Party, President Roosevelt's acceptance address—"Rendezvous with Destiny"—which he delivered at the 1936 Democratic National Convention, made the decision for her. Mrs. Thackrey was so impressed with this speech in which Roosevelt assailed the "economic royalists" for "concentrating into their own hands an almost complete control over other people's property, other people's money, other people's labor . . . making free enterprise privileged enterprise" that she immediately enrolled in the Democratic Party and was appointed radio chairman of the women's division of the Democratic State Committee. Commenting on New Deal legislation, she said: "Taxes seem to me to be far less demoralizing than private charities. I am glad to be taxed because it is the least devastating way to meet social needs both for the underprivileged and overprivileged."

Continuing with her social welfare work (in 1934 she had become a member of the Ellis Island Investigating Committee and a director of the board of Mt. Sinai Hospital), in January 1937 Mrs. Thackrey became secretary-treasurer of the New York Joint Committee for the Ratification of the Child Labor

Amendment. Not one to mince words, she said: "Child labor is economically stupid, socially unjust, and morally wrong." Later that year she was appointed by Mayor La Guardia '40 as a member of the Board of Child Welfare, on which she served until 1939. The Board of Child Welfare, before it was absorbed by the Department of Welfare in 1941, provided funds for destitute mothers whose husbands had deserted them or were deceased or disabled. Mrs. Thackrey was chairman of two of the board's committees, Case Policy and Appeal from Clients, and Medical Care.

In June 1939 Mrs. Thackrey bought the New York *Post* from J. David Stern. The *Post* was founded by Alexander Hamilton in 1801. Some of its stands on important issues during the 1800's were: support of the Jacksonian principles, advocacy of labor organizations, support of the abolition of slavery, defense of free trade as opposed to protective tariffs. In the first three decades of the 1900's the paper followed the *laissez faire* policy. But with the advent of the Roosevelt era in 1932 the *Post* "has become a vital organ, frankly progressive and demanding a greater share in the resources and productive machinery of the nation for the benefit of all people and not for a select and fortunate few."

As director, vice-president, and treasurer of the New York *Post* from 1939 to 1942, Mrs. Thackrey took an active part in managing the newspaper's affairs. A newcomer in the journalistic field, she studied every department of the newspaper plant. In 1942 she was elected president and publisher of the *Post* to succeed her husband who resigned because of ill health. On assuming her new post she immediately announced important changes. She appointed Theodore Olin Thackrey, the executive editor, as the *Post's* editor and general manager. Thackrey's wide experience in the newspaper field was seen as a guiding influence in the subsequent development in the paper's editorial and business policies—it was converted to tabloid size, and its price increased from three to five cents. The new tabloid format was not entirely an innovation for the *Post,* since it had been published in that size for a few weeks in 1934 and on Saturdays during the month before Mrs. Thackrey's change. Although the new publisher said she was "a little afraid intellectuals might feel it a vulgarization to present the news in tabloid," she was influenced by the ease with which a tabloid can be handled, especially in crowded subways. (Following her divorce from George Backer the publisher was married to her executive editor in July 1943.)

As the head of the New York *Post,* Mrs. Thackrey stated that the newspaper's most important job "was to help win the war by supporting the Government's policies. However, the paper will not hesitate to criticize that which seems to be detrimental to the public good." She pointed out that the *Post* is an independent paper and that it is not "pro anything" except pro-American, emphasizing that the paper is not an Administration paper and that it "would back a Republican if he would support such things as social legislation." Interested in making the *Post* colorful as well as factual, Mrs. Thackrey said she would increase its number of features and strengthen the woman's page. One of the regular *Post* features, *Ideas on the March,* is an outgrowth of her own busy day. Unable to find the time to read the news in all the important newspapers and magazines, she had her secretary condense the information. Soon her husband realized that such a summary would be appreciated by many *Post* readers. As it exists today, *Ideas on the March* is a digest of editorials and columns which appear in the leading newspapers throughout the United States; it also includes abstracts of radio commentaries on world events. One of its constant readers, it is said, is Eleanor Roosevelt '40.

DOROTHY S. THACKREY

Although much occupied with the editorial and business policies of the paper, Mrs. Thackrey is also concerned with "inner-organization" relations work. She is greatly interested in her staff and says she derives her greatest satisfaction from giving young people a chance in the field and "watching them grow at their work." She is of the opinion that newspapers should present more of the background reporting of facts because readers are interested in the "whys and wherefores" of a happening. (With the formation of the Post Syndicate in September 1944, several *Post* columnists and cartoonists are now writing for a wider audience). Mrs. Thackrey hopes the newspaper will some day attain the largest circulation in New York City, a goal she says it may reach within ten years. May 1945 Mrs. Thackrey took one step in her expansion plans when she bought the *Home News,* a daily and Sunday paper published in the Bronx borough of New York. Since its founding in 1907, it has been known for its civic spirit. In marking the occasion, Mrs. Thackrey said: "We have admired and respected the high standard of community newspaper service set by the *Home News*, the outstanding community newspaper in America for many years. Our chief interest in assuming the duties and responsibilities of ownership is to make certain the newspaper's service is not impaired, but that its facilities and services shall

THACKREY, DOROTHY S.—*Continued*

continue to expand in the future as in the past with the community itself."

A milestone in the history of the *Post* was the launching of the Paris *Post*, the second American newspaper to be published in the French capital. (Thus far the New York *Herald Tribune*'s Paris edition was alone in the field.) The Paris *Post*, it was announced by *Time*, is "wholly independent of the New York *Post* but voices the same New Dealish views." Its editor is Paul Scott Mowrer, formerly of the foreign staff of the Chicago *Daily News*; and Herbert Pell, former American member of the United Nations War Crimes Commission, is general manager.

Mrs. Thackrey, of the opinion that "there is a wide and hitherto unexplored field of cooperation between radio and newspaper service to the community," bought in July 1944 station WLIB in Brooklyn, New York, for a reported $250,000. News, new features, and discussions of vital topics by known authorities compose about half of the station's program, while the other half is devoted to recorded music programs so diversified as to appeal to listeners of different musical tastes. Postwar plans for this station included added power and the installation of frequency modulation and television. Mrs. Thackrey also owns two radio stations on the West coast—KMTR in Los Angeles and KYA in San Francisco.

The owner of the New York *Post* has backed two successful Broadway plays—*Dead End* and *Abe Lincoln in Illinois*. She was particularly interested in having *Dead End* produced because of the social significance it had for her in the light of an experience she had had. She was living at that time in Beekman Place on the East River (the locale of the play) when her apartment was robbed by street urchins (also an incident in the play). Anxious at first that these boys be caught and punished, after reading the play she felt more kindly toward the delinquents. She has also helped finance the Playwrights Producing Company which in 1945 was composed of four of America's foremost writers—Robert E. Sherwood '40, Maxwell Anderson '42, S. N. Behrman '43 and Elmer Rice '43. Mrs. Thackrey has said of her judgment of plays: "I have average taste, and what pleases me is fairly sure to please a wider public."

An attractive youthful-appearing woman with hazel eyes and dark hair, Dorothy Thackrey is the mother of two grown children—Mortimer Hall, and Adele (Hall) Gray, who in 1944 was married to Lieutenant Arthur Gray, Jr., of the Army Air Forces—and of a younger child Sarah Ann Backer. Outside the office Mrs. Thackrey enjoys trying out the recipes concocted by the *Post* food editor; and in the evening she listens to the radio, particularly to mysteries and political speeches, while she works at her needlepoint. She is described as one of those smokers who can gracefully manipulate a long cigarette holder. "I used to enjoy night-clubbing but now I don't care for it much any more," the publisher has said. "I am happier and more lively when I am working."

TIBBETT, LAWRENCE (tĭb'ĕt) Nov. 16, 1896- Singer

Address: b. c/o W. Colston Leigh, Inc., 521 Fifth Ave., New York City; h. Honey Hill Farm, Wilton, Conn.

The world-famous operatic baritone, Lawrence Tibbett, has gained a wide audience both on the opera stage and through other entertainment mediums, serious and popular. His appearance for seven months in 1945 on the popular-music radio program *Your Hit Parade* caused much comment in the musical world—only Tibbett seemed to see no reason for the flurry. In fact, he considered it only another pioneering job, for he had been the first opera singer to appear in motion pictures and the first to go on a commercial radio series.

Lawrence Mervil Tibbett inherits his interest in new ventures from forebears who were California pioneers in the 'forty-nine Gold Rush. He was born November 16, 1896, in Bakersfield, California, to William Edward and Frances Ellen (Mackenzie) Tibbet. (The singer added another *t* to his surname when an early Metropolitan program spelled it "Tibbett" in error.) His grandfather, father, and uncles were sheriffs. When Lawrence was only seven years old his father was killed by Wild Jim McKinney, a "bad man" of the West, whom Sheriff Tibbet had ordered out of the locality.

"My father had ten thousand dollars in life insurance," Tibbett wrote in his autobiography for the *American Magazine* in 1933, "and my mother took us to Long Beach, California, where she tried to support her four children by running a hotel." Lawrence was twelve when his mother sold the hotel at a loss and moved her family to Los Angeles. "Kindly but inaccurate biographers," says the singer, "have said that I helped to support the family by working as a bellhop and by selling papers. I did both, but we were not so poor that my efforts were any help. The most I ever made in one day by selling papers was fifteen cents, and I was so proud of myself that I spent it all on a banana split." In Los Angeles his mother bought a large house and took in lodgers; and she also worked as a practical nurse to eke out a living and pay for her son's piano lessons. When he became a student at the Manual Arts High School in Los Angeles, young Lawrence began to appreciate the sacrifices his mother was making for him. "I tried to help out by working Saturdays in the office of a Los Angeles paper, stuffing comics and magazine sections into Sunday newspapers, and counting classified ads." In high school he sang in the glee club and acted in a score of plays. "Although I liked to sing," recalls Tibbett, "my ambition was to become an actor."

Young Tibbett's campus hero at Manual Arts High School was an all-round athlete who was to make history in the Second World War as General James Doolittle '42. As a result of their first meeting in the school gymnasium the tall, gangling Tibbett began to give more attention to physical training. The meeting came about when someone suggested that Tibbett "take on" Doolittle, and the two boys faced each other in a test of fisticuffs. "There was a slight sound of a current of air being stirred up—then a bump and silence—as Doolittle advised, 'Stick to singing.'" Later Tibbett learned that an operatic singer—especially a baritone—must have the "diaphragm of a heavyweight prize fighter." (To keep fit Tibbett exercises on a rowing machine and bicycle machine, swims, works on his farm, and occasionally stands on his head before singing—performing the last-named not as a superstition, but to promote good circulation.)

By the time Tibbett was graduated from high school in 1915 he was beginning to earn small fees by singing in church choirs and at funerals. He also obtained a few professional engagements in Los Angeles, with the Civic Repertory Company and with a company headed by Tyrone Power, father of the film star, which gave selected scenes from Shakespeare. But the First World War cut short these beginnings on the stage—Tibbett joined the Navy when the United States declared war.

Four days after his discharge from the Navy, on May 19, 1919, the twenty-two-year-old Tibbett was married to Grace Mackay Smith, who had boarded for several years with his mother. With five hundred dollars he had saved and a car received as a wedding present, the young Tibbetts drove to Portland, Oregon, on their honeymoon. "Although," says Tibbett, "our marriage did not last forever [they were divorced in 1931], it was an adventure and an important event in my life. When I was married I was a dreamer and wanted to sit under a palm tree and philosophize. If I had had no responsibilities I probably would still be sitting under that same palm tree." A year after his marriage twin sons, Richard Mackay and Lawrence Ivan, who served in the Second World War, were born.

The early years of the Tibbetts' marriage were not easy ones. He had a family to support and singing engagements were not exactly plentiful nor well-paying. There is a story about the time when the rent was six months in arrears, the automobile tank empty, and a singing engagement to be kept at a funeral in Los Angeles seventeen miles away. A kind tow came to the rescue, however, so that Tibbett was able to keep the date—he sang two songs, and was paid five dollars. (In 1945 his *Hit Parade* contract called for three songs at a sum estimated at anywhere from twenty-five to forty-five hundred weekly.) Recalling the hardships Tibbett says, "I did not suffer at all, I had a magnificent time." Or in the words of one writer, Lawrence Tibbett believes in "traveling wide open to all that life has to offer. There is a surging, splurging, lunging, plunging vehemence to his spiritedness." The major landmarks in this part of Tibbett's career were a fifty-dollar-a-week position as a prologue-singer in a Los Angeles motion picture house and the role of Iago with a small opera company. But he had already begun to study with voice teachers, one of whom was Basil Ruysdael, a basso at the Metropolitan Opera House before he went to Los Angeles, and who years later was to be announcer on *Your Hit Parade*. (Tibbett has said since that the instruction he received from Ruysdael was most important to him because the teacher caught him in the formative period when he was about to build "pompous-singer" habits.)

LAWRENCE TIBBETT

The turning point of Tibbett's life came when Rupert Hughes, the novelist and musician, convinced him that a successful singing career lay before him and advised him to go to New York to study. In Los Angeles Tibbett was a member of the Orpheus Club, a men's choral society, of which James G. Warren, a wealthy businessman, was president. With money borrowed from Warren, Tibbett left for New York. There his first teacher was Frank La Forge, who at that time was coaching Frances Alda and accompanying Margaret Matzenauer and other famous singers in concert work.

The baritone had been studying six months in New York when La Forge suggested an audition at the Metropolitan. The surprised Tibbett protested that he did not know any opera roles, that he sang only in English, and, moreover, that he did not believe his voice good enough for that distinguished opera company. Three months later, however, he stood on the stage of the opera house prepared to sing the Prologue from *Pagliacci* for his audition. At

TIBBETT, LAWRENCE—*Continued*

the mention of the well-worn audition favorite a sigh of weariness escaped from the impresario seated in the darkened auditorium. La Forge recognized the cue and therefore began playing "Eri tu" from Verdi's *A Masked Ball,* in which the nervous singer's voice cracked on a high F sharp. Three weeks later, through the good offices of Mme. Alda, then the wife of Gatti-Casazza, who was the general director of the Metropolitan at that time, Tibbett was given a second audition. For his singing of Iago's "Credo" from *Otello*, he was engaged at sixty dollars a week. Tibbett has described that first contract with the company in 1923 as "an option affair by which, if they chose, they could keep me for four years, at one hundred dollars a week for the second season, one hundred and twenty-five for the third, and one hundred and fifty for the fourth." It gave him permission to sing in concerts, but "no radio, no musical comedy, no movies" without the Metropolitan's permission. When he appeared in motion pictures in 1929 he paid the Metropolitan a percentage of his earnings.

Before his debut at the Metropolitan, however, Tibbett sang in the Hollywood Bowl (September 1923) in *Aïda*'s Amonasro role. After he had reached the pinnacle of his career and was regarded as America's greatest baritone, Tibbett confessed that he had given *Who's Who* inexact information about his debut role in the Metropolitan on September 24, 1923, because he had not cared to admit that it was an inconspicuous part, sung mostly in the wings. That role was one of two monks in *Boris Godunoff*. His first name role, Valentine in *Faust*, came four days later.

Tibbett was still a comparatively unknown young man who sang brief roles in the Metropolitan when, on January 2, 1925, he won one of the most overwhelming ovations ever given a singer in that company. It was the old, old story of the understudy who makes good. *Falstaff* was being revived as a tribute to Antonio Scotti, and the singer cast in the role of Ford became ill. "The night of the opera," recalls baritone Tibbett, "I . . . let go with all I had. In my aria in the second act I tore my heart out. Some subconscious force lifted me up." The applause that followed lasted sixteen minutes. Twenty years later (1944) critic Oscar Thompson, in discussing the ovation, said that demonstrations in the Metropolitan are a part of the usual order of things and that there is no official record of their length or volume. The only person Thompson knew who could speak with authority on the subject was the late Tom Bull, who had been doorman of the opera house for almost a half-century. Bull had told the critic that there had been only one other demonstration in his memory that topped the one that acclaimed Tibbett. It was the 1900 ovation for Jean de Reszke when he returned in *Lohengrin* after a season's absence. Tibbett's triumph was hailed on the New York *Times* front page as an "unprecedented event," and Olin Downes '43 wrote in praise of his singing: "Exemplary in its sincerity and dramatic feeling, its justness of accent, and its excellent vocal quality." For the first time in opera history an American without European training won stellar honors in one of the world's most important opera companies.

The public was beginning to call Tibbett a one-role singer when a year later he again scored a triumph, in the première of Umberto Giordano's *Cena delle Beffe*. And soon after, he gained stature in the original productions of Howard Hanson's '41 *Merry Mount,* Deems Taylor's '40 *The King's Henchman* and *Peter Ibbetson*, and Louis Gruenberg's *Emperor Jones.* The last, which was written expressly for Tibbett, revealed him as a singing-actor (musical shorthand for the combination of a great voice with the power to create dramatic characterizations). When Tibbett stole the honors from Scotti in *Falstaff* his repertoire consisted chiefly of Italian and French roles, but he soon mastered almost every type of opera, including Wagner. He has a repertoire of nearly fifty complete operas—some five hundred songs—and he has appeared in more than one thousand concerts. His favorite role is Simon Boccanegra in Verdi's opera of the same name. The *Opera News* gives credit to Tibbett for making this opera a success. It had failed on its European première, some seventy-five years before the Metropolitan revived it in 1932. "So inspiring and powerful" was the baritone's singing of that role that critical opinion called it a signal triumph. For several seasons the Metropolitan honored Tibbett by making it the opening opera.

In the spring of 1937, twelve years after his rise to stardom, the baritone made his first opera appearance in Europe. London "mildly condemned him for his melodramatic tendencies," but he "won all hearts" in the première of Eugene Goossens' '45 new opera, *Don Juan de Mañara*, the libretto of which was written by Arnold Bennett. Tibbett's seven-month tour of European capitals brought him new honors: in Stockholm, for example, he received the Litteris et Artibus medal from King Gustav '42. Previously he had received (in 1933) the gold medal of the American Academy of Arts and Letters in recognition of his good diction, and honorary degrees were bestowed upon him: the Master of Music by the University of Southern California in 1928, and Doctor of Music by New York University in 1934.

The artist's first appearance before the microphone was made in 1922 over the Los Angeles station KHJ. His commercial series—over the big networks CBS and NBC—have since included: the *Atwater Kent Radio Hour* (1921-31); *Voice of Firestone* (1932-33); *Packard* (Motor Car) *Presents* (1934-36); *Chesterfield Presents* (1937-38); *The Circle,* for the Kellogg Company (1939); and the *Ford Sunday Evening Hour* (1937-40). After a throat condition prevented him from singing for part of 1940, the baritone appeared on the *Telephone Hour.* Radio audiences have heard him sing also as guest star on numerous broadcasts as well as on the Saturday afternoon broadcasts from the Metropolitan stage. He has recorded his entire repertoire of concert songs, as well as many operatic arias. The Prologue of *Pagliacci,* one of his first records, totaled nearly ten thousand dollars in royalties during its first year.

When it was announced in January 1945 that Tibbett would replace Frank Sinatra '43 on the popular-music program *Your Hit Parade* over the Columbia Broadcasting System, "a small series of shocks ran through musical strata and was registered on operatic and concert seismographs," in the words of *Musical America.* Lovers of the opera deemed it undignified for a Metropolitan star to move into the "crooner's" domain, and Sinatra's "bobby-socks" followers registered their disapproval. *Opera News,* the magazine of the Metropolitan Opera Guild, honored the singer, however, by placing his picture on the cover of its issue for January 15. The contract, announced the magazine, was "the biggest radio deal ever made."

Many listeners expressed dislike of the exceptionally fast rendition of the tunes played on *Your Hit Parade* (called "an outmoded conception of jazz"), a kind of trade-mark of the program. And after Tibbett's debut performance in January 1945 the New York *Times* wrote that the singer "seemed seriously handicapped by the predetermined regimentation of melody." In general, however, his "Don't Fence Me In" and "I Got Plenty o' Nut'in'" pleased listeners. After his final broadcast on *Your Hit Parade* on July 21, 1945, Tibbett left for an overseas USO tour.

Tibbett's announcement in 1929 that he would sing in Hollywood motion pictures created almost as much of a stir as that following his 1945 contract with *Your Hit Parade.* But his venture soon paved the way for the appearance of other operatic stars in films. *The Rogue Song* (1930), which he made with Catherine Dale Owen, played for five months at the Astor Theatre in New York. His other pictures include: *New Moon* (1930) with Grace Moore '44, *The Prodigal* (1931), *The Cuban Love Song* (1931) with Lupe Velez and Jimmy Durante, *Metropolitan* (1935), and *Under Your Spell* (1936).

Throughout his career Tibbett has campaigned for the recognition of American composers and performers—he has been openly scornful of what he has called "the flapdoodle of European prestige." He declares that English-speaking audiences are the only ones patient enough to listen to opera sung in a foreign tongue, and strongly advocates the translation of foreign operas into English for American audiences. Apropos of this, he likes to tell the story of how once during a Metropolitan performance the Russian basso Chaliapin was able to convey a message to his valet in the wings, in the language of the opera—"Go home and get me a suit of underwear."

The famous baritone has given generously of his time toward promoting the welfare of his fellow artists. In 1933 while on a weekend of golf, he and Frank Chapman, the husband of Gladys Swarthout '44, and others formed a society later called the American Guild of Musical Artists. Formally launched in 1936, its one hundred and fifteen charter members include Lily Pons '44, Jascha Heifetz '44, Alma Gluck, and Grace Moore. This organization of eighteen hundred members has succeeded in reducing agents' commissions for concert engagements from 33⅓ to 20 per cent, and commissions for radio engagements have been lowered from 25 to 10 per cent. Tibbett has been president of the Guild since its founding, and in 1940 he was elected president of the American Federation of Radio Artists, a post to which he has been unanimously re-elected ever since. He has also been active in USO camp shows and in Red Cross and war bond drives. He participated in a Carnegie Hall concert devoted to Russian music for the benefit of war orphans of Stalingrad; and, together with Leopold Stokowski '41, Jose Iturbi '43, and the New York Philharmonic Orchestra, he has contributed his services gratis to the New York Center of Music and Drama, which makes concerts, ballets, and plays available at moderate prices.

Divorced in 1931 from his wife, on whom he reportedly made a generous settlement, on January 1, 1932, Tibbett was married again. His second wife is the former Jennie Marston Burgard, the daughter of the late Edgar L. Marston, a banker. A son, Michael Edward, was born in 1933, and the family includes Mrs. Tibbetts' sons by a former marriage. Before the war they lived in an apartment overlooking the East River; their annual New Year's party was a high point in musical circles. In the summer the family lives on Honey Hill Farm in Connecticut, which yields bumper crops of apples. Lawrence Tibbett is a lively conversationalist and is known for his friendliness. He is over six feet tall and weighs one hundred and ninety pounds, and his light brown hair has taken on a gray tinge about the temples.

TOBIAS, CHANNING H(EGGIE), REV.

(tō-bī'ȧs) Feb. 1, 1882- YMCA executive

Address: b. The National Council of the YMCA, 347 Madison Ave., New York City; h. 35 W. 110th St., New York City

A distinguished Negro social worker and religious and civic leader, Dr. Channing H. Tobias has long been a vocal champion of his people's cause. For twenty-two years he has served as Senior Secretary of the Colored Men's Department of the Young Men's Christion Association of the United States, participating in national and international YMCA affairs. Long active in the crusade for interracial understanding and cooperation, Tobias' broad organizational affiliations afford him a wide range of expression and action.

Channing Heggie Tobias was born in Augusta, Georgia, on February 1, 1882, to Fair J. and Clara Belle (Robinson) Tobias. His mother, who was a domestic servant, died when

Bachrach

REV. CHANNING H. TOBIAS

the boy was twelve years old; there was an Indian strain in her ancestry, which is apparent in the facial characteristics of her son. Channing Tobias' father, whose mother had some French blood, had attended Atlanta University. He liked horses, however, and became a coachman. The boy attended the Augusta public schools and then studied for three years at the academy connected with Paine College preparatory to entering the college itself. He received a B.A. degree in 1902.

In 1900 he was ordained a minister of the Colored Methodist Episcopal Church. For further religious training he studied at the Drew Theological Seminary in Madison, New Jersey, where he received his B.D. degree in 1905. During the next six years he was professor of biblical literature at Paine College, taking time out in 1908 for special work at the University of Pennsylvania. Stepping from his role as classroom teacher, Tobias then entered YMCA work, thus carrying on his educational mission on a broader plane. He became student secretary of the International Committee of the YMCA's, a post he held for twelve years. Elected senior secretary of the Colored Men's Department of the National Council in September 1923, Tobias has since retained that position. From 1935 to 1942 he also served as associate director of the Commission on Interracial Cooperation.

In 1921 the Negro leader was a member of the Pan-African Congress in Paris and of the student deputation visiting European relief areas. During the year 1926 he was a delegate and speaker at the World Conference of the YMCA's at Helsingfors, Finland, where he led group discussions on race relations. In 1926 he also lectured at Riga, Latvia, and visited YMCA centers there and in Estonia, Poland, and Czechoslovakia. Two years later he served on the executive committee of the National Interracial Conference in Washington, D.C. The year 1934 found Tobias in the Capital again, as a member of the Planning Committee of the National Conference on the Fundamental Problems in the Education of Negroes. Tobias and Benjamin E. Mays '45 were the two Negro members of the twelve-party United States delegation to the World Conference of the YMCA's in Mysore, India, in 1937. The Senior Secretary spent considerable time before and after the conference traveling in the Near East and the Far East; his pamphlet *Travel Notes*, covering the period from December 1936 to March 1937, reveals his impressions and opinions of peoples and places observed. From Cairo he wrote of the thrill of viewing the contributions of the Negro to the great ancient civilizations, adding: "What a tonic it was to live for a few days in a land where color carried no opprobrium with it." India's vastness impressed the YMCA executive and he was especially pleased to see the lack of color prejudice among the Indians. He was sympathetic with their struggle for independence under the leadership of Gandhi '42 and of Nehru '41, whom he termed "the coming man of India."

At the YMCA World Conference Tobias held a vital assignment as chairman of the Commission on Race Relationships under whose sponsorship a resolution was passed unanimously by the Conference stating that "national movements request their local associations to do away with racial exclusion policies in membership." Tobias points out that "America and South Africa are practically the only countries in the world where racial exclusion is practiced in YMCA's." At the conclusion of the Conference, the delegate proceeded to visit YMCA's in various parts of India before continuing his journey to Ceylon and thence to China. Tobias found the Chinese people deeply interested in the Negro problem in America; and his university and church addresses were cordially received. Visiting the large cities of Japan next, the American tourist then continued his journey through the Pacific, arriving finally at Hawaii. "As attractive as it is for natural beauty," Tobias remarked, "it is more attractive as a social laboratory in which problems of race relationships are being worked out satisfactorily. I felt pride in my American citizenship as I mingled with the people of Honolulu, for at least I had found a spot under the American flag that seemed to be devoid of color consciousness."

Besides his YMCA work, the social worker's interest in youth has been further channeled through educational and community activities. Tobias is a member of the board of trustees of Howard University, Paine College, Hampton Institute, and Palmer Memorial Institute; he serves on the joint advisory council of the Harlem Educational Projects and belongs to the board of directors of Youth House, Forest House, and the Wiltwyck School for Boys. Prominent in civic affairs in New York City, he belongs to the City-wide Citizens Committee on Harlem and is on the board of directors of the Citizens Housing Council. He is a veteran adviser of youth, and has delivered numerous commencement addresses, including sermons at Morehouse College, Fisk University, and Tuskegee Institute. In 1942 he spoke before the American Association for Adult Education on the topic "Training and Job Opportunities for Negroes in Postwar America." Again in 1943 he dealt with this problem in his speech, "The

Larger Task of Education for Negroes," delivered at the tenth annual conference of the Association of Colleges and Secondary Schools for Negroes.

In a speech at Hampton Institute in 1940 entitled, "Let Negroes Work," Tobias, recommending vocational training, declared: "We have come finally to see that while our professional classes are indispensable to our ultimate progress and success, they are absolutely helpless without the support of the laboring masses." Broadcasting that year in the eighth vocational opportunity campaign conducted by the National Urban League, the YMCA leader treated the topic "Prepare Today for Tomorrow's Job." He decried the limited employment sphere open to Negroes and cited unemployment, which falls heaviest on the Negro, as "the one great shadow that darkens the pathway of his progress."

Tobias' activities during the war kept the leader busy as a member of the National Advisory Committee on Selective Service, the Joint Army and Navy Committee on Welfare and Recreation, the Negro Service Committee of the United Service Organizations, and various war fund groups. His interest in the deeper problems of war and peace is evidenced by his affiliation with the Committee on Overseas Relief and Reconstruction and the committee of direction of the Commisison on a Just and Durable Peace. His religious ties are wide: he belongs to several committees of the Federal Council of Churches of Christ in America, the Universal Christian Council for Life and Work, the board of managers of the American Bible Society, and the Commission on the Church and Minority Peoples.

Especially concerned with the problems of the Negro people and harmonious race relations, Tobias serves with several groups devoted to such work. He is a member of the board of directors of the National Association for the Advancement of Colored People, the Council on African Affairs, the (New York) Mayor's Committee on Unity, and the American Council on Race Relations. Tobias is also cochairman of the executive board of the New York Chapter of the Southern Conference on Human Welfare. In an address to this assembly, Tobias stated: "I have greater confidence in this group than any other in the South because it has had the courage from the beginning to say that we cannot have wholesome relations across racial lines as long as those lines remain intact." Late in 1940 Tobias, together with Walter White '42 and A. Philip Randolph '40, conferred with President Roosevelt on the status of the Negro in the armed forces and war industries.

A popular speaker on race relations, the Negro leader has addressed many organizations and colleges, among them Vassar College and Columbia University, and local YMCA's throughout the United States. His broadcasts have included OWI shortwave programs and three appearances on the *New World A-Coming* series. At a Cooper Union forum in March 1943 Tobias discussed "The Negro in Our Democracy." While acknowledging signs of progress in race relations, he stated the problems confronting the Negro as the victim of a "double standard of citizenship." There have been only faint efforts to make democracy work for this one-tenth of the Nation, Tobias contended. Aware that much of the resolution of the difficulties of race relations depends on slow educational processes, he believed, nevertheless, that it was "possible under the stress and pressure of war to move forward immediately and effectively in bringing about changes in certain fixed practices without which changes it would be impossible for America to push ahead rapidly to the winning of the war and the achieving of a just and lasting peace." Five suggestions for such action were proposed by Tobias: (1) a Presidential order for the abolition of segregation in the armed forces; (2) full compliance with Government Order 8802 (FEPC) barring discrimination by industries holding war contracts; (3) the abolition of the segregated blood plasma policy of the Army and Navy as practiced by the Red Cross; (4) newspapers to stop their policy of "associating race with crime in the case of the Negro, as is done with no other racial group"; (5) the motion picture industry to abolish its code restrictions "that confine Negroes to roles of menial service and buffoonery."

Speaking before the Foreign Missions Conference in 1944 on "World Implications of Race," Tobias considered British and American foreign policy as it affects race relationships, and declared: "I am absolutely certain that there will be trouble down the road if the victorious nations, following this war, insist upon holding unbroken the ring of white dominance that now encircles the darker peoples of the earth." Expressing hope for all peoples despite difficulties ahead, the speaker, however, went on to qualify his faith. "Blueprints alone, though backed and implemented by all the combined material resources of the Allied nations, cannot change deeply rooted prejudices into mutual trust and good will," he said. "That is a spiritual task, and leadership and direction for such a task can only be provided by an institution that is spiritually motivated. That is why I pin my hope for future good will and peace among the races of mankind on the Christian church."

The end of the war, which brought with it problems of reconversion and unemployment, spurred Tobias to renewed activity in behalf of his people. He helped to draft New York State's fair employment act, aimed at eliminating discrimination in employment because of race, creed, color, or national origin. That measure, known as the Ives-Quinn bill, became effective in July 1945; it was the first law of its kind to be passed by any State. Tobias was also active in the fight for the continuation of the Federal Fair Employment Practice Committee. In a speech in Washington he told of widespread bias against minority groups and of organized attempt to block FEPC legislation. He also "pointedly warned" both major parties that their action or inaction on that legislation would be reflected in votes cast by minority groups for Senators and Representatives in the 1946 elections. Another example of racial discrimination that brought vigorous protest from Tobias was the denying of the use of D.A.R.'s Constitution Hall to Hazel Scott '43. In his letter to President Truman, Tobias particularly expressed regret that the Hall had been "honored by the presence and patronage"

TOBIAS, CHANNING H. REV.—*Cont.*

of Mrs. Truman on the day after the D.A.R. had barred the Negro musician.

In the political field, Tobias' activities have placed him generally on the liberal side. According to Roi Ottley '43 (*New World A-Coming*), Tobias, as the Fusion Party's candidate for the New York City Council in 1941, withdrew from the election in favor of the Reverend Adam Clayton Powell, Jr. '42. Designated for the same office in 1943 by the New York County Executive Committee of the Republican Party, Tobias declined the nomination. In September 1944 Tobias, together with the Negro leaders Walter White and Mary McLeod Bethune '42, conferred with President Roosevelt '42 and won his renewed promise of support in the struggle against racial discrimination. During the 1944 presidential campaign, Tobias, a lifelong Republican, worked vigorously for the reelection of Roosevelt. His many campaign appearances included speeches at the rally for Roosevelt sponsored by the Independent Voters Committee of the Arts and Sciences for Roosevelt, at the Liberal Party rally for the President, and for the National Non-partisan Committee for the Re-election of Roosevelt.

Tobias was twice chairman of the Negro Freedom Rally held in New York's Madison Square Garden in 1943 and 1944. In January 1945 he hailed the nomination of Henry A. Wallace '40 as Secretary of Commerce, and at a Wallace rally at Town Hall the following month he spoke in support of confirmation of the appointment. In January he also addressed a Madison Square Garden meeting which urged the United States to break relations with Franco '42 Spain. At a CIO rally for labor unity in March, Tobias was a principal speaker. Elected to the National Committee of the National Citizens Political Action Committee in May, he is also on the executive board of the New York chapter of the Union for Democratic Action. An admirer of the late Wendell L. Willkie '40, Tobias was on the Sponsors Committee of the Willkie Memorial Building Fund of Freedom House, and he is a member of the honorary committee for the Wendell L. Willkie Awards, prizes for distinguished writing published in Negro newspapers and magazines.

Articles by Tobias have appeared in various magazines. His address to the Hartford YMCA on the occasion of the hundredth anniversary of the Association in June 1944 (printed in pamphlet form) contains his eight-point program for improvement of the YMCA. Significant in this outline are proposals to encourage members to participate in public affairs, to increase democracy within the organization, and to remove race and color bars. Tobias is a member of the board of editorial advisers of the *Protestant Digest* and also belongs to the editorial board of the *Protestant Voice*.

In November 1945 Tobias was made director of the Phelps-Stokes Fund, which is concerned with national interracial relations and Negro education and with housing for Negroes in New York City. Recipient of the Harmon Award for Religious Services in 1928, the clergyman was named on the Schomburg Honor Roll of Race Relations in 1943 and the following year he received the citation of the Chicago *Defender* Honor Roll. Tobias holds an honorary D.D. degree from Gammon Theological Seminary (1924) and an honorary LL.D. from Morehouse College (1942).

In 1910 Channing Tobias was married to Mary Pritchard, whom he had met as a fellow student at Paine College. One daughter, Mary, directed arts and crafts in the USO. Another daughter, Belle, a graduate of Barnard College with a Master's degree from Wellesley, is deceased. A picture of Mary, now Mrs. Dean, and her two small children hangs on the wall behind Tobias' desk. They are, he says, his "hobbies."

TOBIN, DANIEL J(OSEPH) 1875- Labor leader

Address: b. International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers, 222 E. Michigan St., Indianapolis, Ind.

Since 1907 Daniel J. Tobin has been president of the International Brotherhood of Teamsters, Chauffeurs, Warehousemen and Helpers, one of the most powerful labor organizations in the United States. Commonly known as the Teamsters Union, this labor group is considered as occupying a crucial position in relation to the Nation's economy, for, according to Tobin, who is regarded as a moderate in aims and methods, it touches every trade and industry in the country. The union is the largest affiliate in the American Federation of Labor, of which "the fighting Irishman" has been a vice-president since 1933. A vigorous supporter of the late Franklin D. Roosevelt '42, he has represented labor at international meetings and in Government posts, and he has been active in the drive to achieve unity within the labor movement.

Daniel Joseph Tobin, the son of John and Bridget (Kennelly) Tobin, was born in Ireland in 1875. When the boy was only fourteen he journeyed alone to the United States. At first he attended grade school and evening high school classes in Cambridge and Boston, but later he continued his studies at home. Tobin has vivid recollections of his early working days in Boston, where he drove a team of horses for a trucking concern, and was paid eleven dollars for a sixty- or seventy-hour work week.

He soon joined the local teamsters' union and, as its Boston representative, became active in its struggles. This was a stormy period for America's developing labor movement, and Tobin, so to speak, grew up with it, a friend and follower of the A.F. of L. founder and president, Samuel Gompers. In 1903 the Team Drivers' International Union and the National Teamsters of Chicago were merged to form the International Brotherhood of Teamsters, an affiliate of the A.F. of L., and four years later Tobin became the president of the new body, the position he still holds. Since 1903 the union has grown into an organization of almost a thousand locals in the United States and Canada, with a membership of seven hundred thousand, encompassing almost every category of the trucking field. According to an article in *Fortune* in May 1941, the Brotherhood that year had funds amounting to more than six million dollars and paid its president a yearly salary of thirty thousand dollars, plus expenses.

The Teamsters have acquired over the years a reputation for rough tactics, but one writer reports that "nothing will infuriate 'Uncle Dan' so much as a slur on the character or conduct of his Teamsters." Considerable discussion has centered on the internal operation of the union, and charges of racketeering and abusive practices have been leveled against certain locals. However, in the words of one writer in *Fortune* (1941), "No responsible person has ever challenged the personal honesty of Uncle Dan Tobin, and undoubtedly the great majority of Teamsters' locals are thoroughly honest. But some of the strongest ones have been under suspicion." *Business Week* (July 1942) noted an emphatic "crime-must-go" attitude in the union's publication, although Tobin appeared to the *Fortune* writer as "far more interested in proceeding against Communists, representing the new militant members, rather than against corruption." (The Teamsters' constitution bars Communists from membership.)

Fortune describes Tobin as a conservative exponent of the "old-line" philosophy who has shown a cautious use of power in his leadership. He favors arbitration, but forsees dangers to labor if it is made compulsory. He has warned his membership against "excessive demands that might result in driving employers out of business," and he is opposed to strikes except as a last resort. He sees in industrial unionism (CIO), as contrasted to craft unionism (A.F. of L.), "an attempt to destroy the very foundations upon which this Federation [the A.F. of L.] has been builded and upon which it has succeeded for years." In 1942 *PM* reported that the union chief objected to the issue of Negro A.F. of L. membership being raised at that year's convention. Tobin as an individual has also been the target of sharp criticism by writers whom some regard as pro-CIO: Edward Levinson in *Labor on the March* (1938) sees Tobin as skillful in "swathing his dictation in sentiment and blarney," while Herbert Harris in *American Labor* (1938) describes the Teamsters' head as "hard-boiled and autocratic."

During the war Tobin cooperated closely with the war effort. In November 1941 he called off a Detroit strike of railway express drivers in deference to the wishes of the President; the next year he rebuked a Pittsburgh local for a sympathy strike. The June 1945 issue of the *International Teamster* printed his injunction to his men to disregard picket lines unless otherwise ordered by union officials. The union leader is proud of the Teamsters' war record and boasts that the union observed the no-strike pledge "almost 100 per cent."

The January 1945 issue of the union magazine included an article by Tobin's executive assistant calling for repeal of the Wagner '41 National Labor Relations Act and abolition of the National Labor Relations Board, which, he said, had "become nothing more than a standing committee of the CIO." This article occasioned a flurry of comment in the press and in labor circles, until Tobin declared his sentiments in the February issue, affirming his approval of the Wagner '41 act but condemning the work of the NLRB. In March Tobin repudiated an editorial in the magazine (of which he is editor) urging support of the "Little Steel" wage formula. He appeared before the Senate Finance Committee in June to endorse the Reciprocal Trade Agreements Act, emphasizing that the United States must play a part in the rehabilitation of Europe. The year before he had stated his refusal to participate in the World Conference on Labor in London because he would not deal with organizations which he felt were not free—"whose wages are set by the government."

DANIEL J. TOBIN

Since the split within labor's ranks and the subsequent formation of the CIO in 1935, labor leaders, Tobin among them, have been trying to mend the breach. In December 1942 he was a member of the six-man committee of A.F. of L. and CIO representatives who engaged in a labor peace conference. The committee deliberations resulted in a public declaration of a mutual desire to work toward unity and to cooperate in the installation of machinery toward this end. The Teamsters' chief supported these sentiments, observing, "Remember, this is the first time we have ever made such an agreement." Serving on a joint committee to handle jurisdictional disputes the following year, Tobin's optimism was seen as waning. "We have just enough men on both sides who look at today and fail to look for tomorrow, and who are anxious to make a mountain out of a molehill," he declared. "Lawmakers and politicians and other enemies are most certainly taking every advantage of us, because and only because of the division of labor—a division that should never have been, and a division that now should and could be eliminated if leaders of labor sincerely and unselfishly desired it."

Tobin was active in the negotiations between the A.F. of L. and John L. Lewis '40, head of

TOBIN, DANIEL J.—*Continued*

the United Mine Workers. In 1943 Tobin was chairman of a three-man committee which conferred with Lewis on his application for readmission of the U.M.W. into the Federation. In August of that year Louis Stark '45 reported a session of the A.F. of L.'s executive council at which Tobin made a motion to refer Lewis' application to the A.F. of L. convention. Another reporter remarked that "foxy" Dan Tobin was an "active wire-puller" against Lewis' readmission into the Federation. According to William Green '42, the convention instructed the executive council to resume negotiations with Lewis, and in 1945 deliberations were still going on. The New York *Times* reported in February that Tobin opposed the reaffiliation of the U.M.W., except on condition that all jurisdictional disputes between the miners and the A.F. of L. first be settled.

During four successive Presidential election campaigns Tobin has served as chairman of the labor division of the Democratic National Committee. In October 1944 the Teamster leader criticized the nonpartisan stand of the A.F. of L. executive council, refuting the argument that the Federation is traditionally nonpartisan by recalling the positive political activities of Samuel Gompers. In the stormy political climate of the 1944 elections, the New Deal laborite waged a vigorous campaign aimed at unifying the labor vote for Roosevelt, Truman '45, and, in New York, for Senator Robert F. Wagner. President Roosevelt, moreover, opened his campaign for a fourth term with an address to the Teamsters at the Statler Hotel in Washington, D.C. The much publicized "Battle of the Statler" followed the speech, involving some Teamsters and two Navy men. The press carried conflicting accounts of the incident, which was seized upon as "campaign fodder." A preliminary inquiry into the case by the Senate Campaign Expenditures Committee quickly resulted in dismissal of the entire matter. After the election the Teamsters Union claimed credit for Roosevelt's victory, asserting that the union had done more than any other organization in America to bring it about. In 1945, together with most of the labor movement Tobin strongly supported the appointment of Henry Wallace '40 as Secretary of Commerce.

During Roosevelt's tenure of office Tobin several times served in Government posts, or in an advisory capacity. Appointed administrative assistant to the Chief Executive in July 1940, he held this post until October, when he resigned to take up election duties. In 1942 Tobin was one of the A.F. of L. members of a special advisory board to the President. In August of that year Roosevelt sent the labor leader to England to investigate labor conditions and to report his findings to the American people. Upon his return from this assignment Tobin delivered a radio report which was printed in the *Congressional Digest* in March 1943. An outspoken New Dealer, Tobin was offered a position as regional administrator under the PWA in 1933, a post which he declined. Twice, in 1933 and again in 1945, his name was mentioned for the position of Secretary of Labor. In January 1933, it is reported, a petition was signed by "every leading labor man in the United States, including John L. Lewis, on behalf of Tobin."

The Teamsters' president has also seen service as treasurer of the A.F. of L., from 1917 to 1928, when he resigned; as vice-president of the Federation since 1933, in which capacity he has sat on the organization's executive council. He has also been vice-president of the National Building Trades Department since 1933. Active on the international labor scene, Tobin represented the A.F. of L. at the British Trades Union Congress in 1911, 1938, and 1942. In 1918 the Teamster chief was a delegate to the International Federation of Trade Unions at Amsterdam. He was also present at the conference called by the International Labor Office at Geneva in 1939, having been delegated by the Government to attend. In the First World War Tobin was a member of President Wilson's Industrial Conference and also served on various labor mediation boards.

Hard-hitting, burly "Big Dan" Tobin is an orator of the old school, whose eloquence has won him a reputation as somewhat of a spellbinder. He is five feet eight inches tall, has a fair complexion and wears his gray hair parted in the middle. His first wife was the former Annie Reagan, by whom he has five sons. After her death, in 1923 Tobin was married to Irene Halloran. The Tobin children are John, Frank, Frederick, Edmund, Joseph, and Katherine.

TOLBUKHIN, FEDOR I(VANOVICH) (tôl-bo͞oᴋ'ĭn fyô'dẽr ĭ-vȧ'nŭ-vyĭch) 1895(?)- Russian Army officer

Address: b. c/o Commissariat for Defense, Moscow

The victorious defense of Stalingrad in the fall and winter of 1942, and the accompanying annihilation of the German Sixth Army under Field Marshal Friedrich von Paulus, brought to the attention of people outside the Soviet Union many able leaders among the officers and men of the Red Army. Prominent among them is the commander of the Third Ukrainian Army, Marshal Fedor I. Tolbukhin, whose encircling tactics in this campaign were highly rated by military experts.

There are few facts available on the early life of Fedor Ivanovich Tolbukhin. It is known that he was born about fifty years ago, and that his father was a peasant who had served as a private in the Czar's Army. At the time of the First World War the twenty-year-old Tolbukhin enlisted in the Army as a motorcyclist. After being wounded he went to an officers' training school, from which he went back into combat, eventually becoming commander of a battalion. When the Revolution broke out the young officer joined the Red Army.

The Marshal's military accomplishments meant repeated disasters for the Nazi forces that opposed his army on the southern flank of the great Eastern front. Pacing the entire Russian offensive that was initiated after the heroic defense of Stalingrad, the Fourth

Ukrainian Army by a brilliant and daring thrust under Tolbukhin pierced the German lines north of Taganrog in August 1943 for a distance of twenty-eight miles. While shock troops drove on that strategic prize from the east, he closed the northern arm of his pincers on the Sea of Azov. Caught in this trap, the German forces were disposed of, group by group. Greater than the physical losses of the Nazi forces (35,000 killed, 5,100 prisoners), however, was the threat to the entire German Army in the Donets Basin, whose flank was now exposed. From this time on, the Germans were unable to make a successful stand short of the Dnieper River.

The fall of Taganrog made Stalino, another important city in the Donets Basin, untenable by the Germans. On September 8 this great mining and manufacturing center fell to General Rodion Y. Malinovsky's '44 Red Army shock troops. Two days later Colonel General Tolbukhin's tanks and cavalry south of Stalino swept along the coast of the Sea of Azov to seize Mariupol, port of the Donets Basin. These victories were hailed in Moscow by twenty salvos from two hundred and twenty-four guns, and Marshal Stalin '42 announced in an order of the day, "The troops of the southern and southwestern fronts have torn from the Germans and returned to our country the Donets Basin, the most important coal and industrial region of our country."

With the German forces in this area completely demoralized, Tolbukhin pressed his advantage. His army raced along the north shore of the Sea of Azov, and by November 1943 had sealed off the Crimean peninsula by taking Genichesk and Perekop, and had reached the lower Dnieper River with the capture of Kakhovka. In this operation large forces of Nazis were trapped on the shores of the Sivash Sea, while far to the west of the Perekop isthmus Tolbukhin's hard-riding cavalry rapidly cleared the Nogais Steppe, forcing the fleeing Nazis back across the Dnieper. Even though supported by artillery and mortar fire from the west bank of the river, the Germans found the crossing a costly one.

Consolidating his gains, Tolbukhin prepared his Fourth Ukrainian Army for the next phase of the offensive. In February 1944, in conjunction with General Malinovsky's Third Ukrainian Army, his forces cleared the Germans from their Dnieper bridgehead east of Nikopol, capturing that great manganese center in one of the bloodiest battles in history. By the time the commander of the Fourth Ukrainians had ordered his guns to cease firing, tens of thousands of Germans had fallen.

While the Nikopol bridgehead was being eliminated, General Tolbukhin was making extensive preparations for the drive into the Crimea. Early in April he sent one force driving down the Perekop bottleneck, while his other troops drove across the shallow, salt marshes of the Sivash Sea. Overrunning the antitank ditches and thick mine fields on the isthmus, he breached the German lines, and both arms of the attack joined to capture Simferopol, capital of the Crimea, on April 14, while eighty miles to the east General Andrei Yeremenko's Independent Maritime Army forced the Kerch Strait. Combining forces in the Crimea, both armies drove on Sevastopol the next month, and after a three-day assault captured the "jewel of the Crimea." The fall of the great naval base was hailed as a strategic victory of primary importance, for with it went control of the Black Sea.

MARSHAL FEDOR I. TOLBUKHIN

General Tolbukhin was now ranked among the eleven top officers of the Red Army. These eleven men had two things in common: all were unknown outside the Red Army before the German attack in 1941, and all were relatively young men. In recognition of his able and courageous leadership of military operations and for successes achieved as a result of these operations in the fighting against the Nazi invaders, General Tolbukhin was awarded the Order of Suvorov, First Class, shortly after the fall of Sevastopol. In September 1944 he was again honored, by promotion to the rank of marshal. He was now in command of the Third Ukrainian Army, and Malinovsky had assumed command of the Second.

While Tolbukhin was freeing the "Florida" of Russia, Malinovsky drove into Odessa, completing the liberation of southern Russia, east of the Dniester River. Then, in late August, the two armies combined forces to retake the province of Bessarabia, which had been ceded to Rumania by the Germans. Along the Black Sea flank raced the Third Ukrainian Army. It stormed Kishinev, while below the city a noose was closed around sixty thousand Germans. Then the Third Ukrainian Army sped down the coast. In a few days Tolbukhin's troops were deep within the sprawling, muddy Danube Delta, having captured Ismail and Galati, eastern anchor of the gap leading into greater Rumania. Within a week the Russians had advanced 125 miles, overrun 18,500 square miles, recovered all of Bessarabia, and killed or captured 300,000 enemy troops. Strategically, the Carpathian line was turned, Rumania was tactically and politically tied to Russia, the great wheat fields were

TOLBUKHIN, FEDOR I.—*Continued*

available to feed Russia's population, and the Ploeşti oil fields, last major source of German fuel, were exposed to capture.

With this major Russian victory the German stand in the south collapsed. Within a few days Ploeşti fell, Bucharest capitulated, and the German puppet governments in the entire Balkan area crumbled. Bulgaria, which had only recently become a belligerent by Russia's declaration of war, made a complete turnabout and on September 8 declared war on Germany, exposing the German forces in Greece to capture. By October Marshal Tolbukhin had driven into Yugoslavia, where he joined with the Yugoslav National Liberation Army of Marshal Tito '43 to liberate the charred ruins of Belgrade, capital of Yugoslavia.

Added to the military responsibilities of Marshal Tolbukhin were the political concerns of the Russian Government in the Balkans. While his army pushed into Hungary to threaten Budapest, he negotiated for the surrender of Bulgaria, and on October 28, 1944, he signed the terms as the representative of the Soviet Union. (Lieutenant General J. A. H. Gammell signed for the Allied Supreme Command in the Mediterranean theater.) Russia's influence in southeastern Europe had reached a point never before attained by any government in the complicated history of that area. Charges were made, however, that Tolbukhin had unduly suppressed the efforts of a democratic group in Bulgaria to challenge other political parties for control, and much was written about the Communistic influence in the uprising in neighboring Greece. In carrying out the interests of his own Government, Tolbukhin deferred the claims of Bulgaria and Greece for postwar arbitration. For the present, it was said, civil affairs would be conducted by a provisional administrative committee of one Bulgarian, one Greek, and one Turk.

Meanwhile, the drive into Hungary, last ally of the Germans, continued; Budapest was threatened by Tolbukhin's flanking drive through southwestern Hungary and northern Yugoslavia. Pushing through the area flanked by the Danube and Drava rivers, the Third Ukrainian Army reached the shore of Lake Balaton on December 5 and surrounded the northern and southern ends of the fifty-mile-long lake. Capturing Székesfehérvár, strategic city on the northern end of Balaton, Tolbukhin then drove northward to cut the main escape route from Budapest to Vienna. By Christmas Day the Hungarian capital was virtually encircled, and on December 30 an ultimatum was sent to the German commander in the besieged city, who, instead of accepting the offer, had the Russians shot who delivered it. For the next forty-nine days Tolbukhin and Malinovsky drove on the city, which finally fell on February 13, 1945. The cost to the stubborn Nazis in men, food, and equipment was terrific; they had suffered the greatest manpower disaster since Stalingrad—110,00 soldiers captured and 49,000 killed. This high cost was followed by an additional loss of 16,000 men in the German counterthrust northwest of Vienna.

These terrific losses dismayed the Germans. War industries in Austria and Czechoslovakia, the last the Nazis had for the defense of the "inner bastion," were threatened. To throw back the oncoming Russians, a desperate counterattack was begun. Eleven tank divisions were thrown into the battle, and, for a few days, Marshal Tolbukhin's troops were hard-pressed. Despite the critical state of the battle, however, the Russian General held out his reserves until the German armor had been over one-half destroyed. When he did send forth his operational reserves, they were able to advance forty miles on a sixty-mile front. By March 30 they had crossed the Austrian border and captured Köszeg. On the southern end of Lake Balaton another arm of Tolbukhin's army drove into the Hungarian transport hub of Nagykanizsa, then on toward the Italian border, for the Germans had not yet evolved a defensive strategy to combat the Red Army's technique of taking bastioned cities by complex, encircling attacks. As they did at Budapest, the two big armies of Marshals Tolbukhin and Malinovsky struck swiftly at the sides of Vienna. After crossing the Morava River, the Red raiders leapfrogged ashore at night to attack from the rear. Through the woods to the west infantrymen crossed the main roads leading from the city, then cut swiftly to the Danube north of the city. On April 13 the Russians burst through, and the capital fell—seven years, one month, and a day after Adolf Hitler '42 had sent his legions into the capital of Austria for the forced *Anschluss* of 1938.

On the 8th of May President Truman '45 and Prime Minister Churchill '42 simultaneously announced the end of the war in Europe. On the Russian front the fighting continued where Germans refused to surrender. Ten hours after the official V-E Day proclamation Moscow announced the German surrender to the Russians. Yet on the 10th of May German forces in Czechoslovakia had still refused to surrender, and in Austria Tolbukhin's Third Ukrainian Army mop-up squads were still busy. Shortly afterward Tolbukhin's troops linked up with the British Eighth Army west of Graz. On May 16, at a spontaneous ceremony near Linz, Austria, Tolbukhin pinned the Order of Kutuzoff First Class on General George S. Patton, Jr. '43, on behalf of the Soviet Government.

Tolbukhin is often referred to as a rotund man with a heavy, calm face. When viewed from certain angles he bears a striking resemblance to Winston Churchill. Regarded as an expert horseman, he is known, incidentally, as one of the "Four Horsemen of the German Apocalypse," the others being Konstantin Rokossovsky '44, Ivan S. Konev '43, and Rodion Y. Malinovsky. In April 1945 Tolbukhin received the diamond-studded Order of Victory, the Soviet Army's highest award.

TOLSTOI, ALEKSEI NIKOLAEVICH, COUNT (tŭl-stoi' ŭ-lyĭ-ksyā'ĭ nyĭ-kŭ-lȧ'yĕ-vyĭch) 1882—Feb. (?) 1945 Soviet Russia's greatest contemporary writer, so called by many critics; left Russia during the Revolution in 1917, but returned in 1922; abandoned his nonpolitical attitude when his country became menaced by Nazi Germany, taking an active part in the Soviet propaganda front; one of his major works was *Peter the Great,* translated into English in 1932.

TRUMAN, HARRY S. May 8, 1884- President of the United States

Address: The White House, Washington, D.C.

NOTE: This biography of Harry S. Truman supersedes the one which appeared in *Current Biography* in 1942, when he was United States Senator from Missouri.

Harry S. Truman, who succeeded to the Presidency of the United States on the death of Franklin D. Roosevelt '42 on April 12, 1945, is considered "a real United States American." His grandparents, Kentuckians of Scottish and English ancestry, had settled in Jackson County, Missouri, in 1842. One Truman, Harry's cousin, did eventually become a general in the United States Army, but all the other Trumans were plain, solid citizens. Both of Harry Truman's parents, John Anderson and Martha Ellen (Young) Truman, took the Confederate rebels' side in the Civil War, and were therefore forced to leave their homes for a time; years later, aged Martha Truman still corrected reporters with a sharp "I'm no Yankee." Their son Harry, the first of three children, was born May 8, 1884, nineteen years after the conclusion of the war, in Lamar, Barton County, Missouri. When it came to giving him a middle name, they could not agree on either Shippe, for his Truman grandfather, or Solomon, in honor of his maternal grandfather. They compromised on simply "S."

When Harry was four the Trumans moved to Grandview, six hundred rolling acres of bottomland, eighteen miles from the county seat of Independence, which four generations of Trumans had farmed. Three years later (1891), they moved to Independence, where John Truman carried on his business in livestock. At nine Harry entered the Independence school. A shy, quiet boy who wore glasses from the age of eight, the future President "made books his sport," while his classmates were racing their horses around the countryside. By fifteen he is said to have read every one of the books in the local library. Mrs. Truman discovered that her son had some musical talent, and compelled him to take piano lessons from the age of nine. "In Independence, Mo., in 1893 this was tough," comments Gerald W. Johnson in *Life*. "All the young Tom Sawyers in public school regarded a boy who studied music as a terrible sissy, and the music roll that Harry Truman carried through the streets was a stigma that evoked merciless ridicule. However, it was easier to defy the gang than his mother, so he stuck to it until approaching manhood and the necessity of earning a living deprived him of the necessary time." He is still fond of playing the piano, and wishes he could perform the Chopin études better than he does.

Blackstone Studios

HARRY S. TRUMAN

Young Truman, a diligent student of military history, obtained an appointment to West Point after graduating from the three-year Independence high school, but was rejected because of his defective vision. The Trumans had suffered financial reverses, and while in high school Harry had worked part-time: a year in a drugstore for three dollars a week, and six months at seven dollars a week wrapping papers in the mailing room of the Kansas City (Missouri) *Star*. Now the seventeen-year-old boy went to work for thirty-five dollars a month and board as timekeeper for the construction crews building local Santa Fe railroad trackage. After six months he went to Kansas City and got a job at the same salary with the National Bank of Commerce, where his brother Vivian was already employed. After a year the youth changed to the Union National Bank as a bookkeeper. He remained in their employ three years, eventually earning $125 a month—"a heck of a high salary." When the future President was twenty-two, the bachelor uncle for whom he had been named retired and turned over to the Trumans the farm where Harry was reared, whereupon the family went back to the country.

For twelve years Truman was a farmer, and although he had not chosen that occupation he calls them the happiest days of his life. "That boy could plow the straightest row of corn in the county," his mother recalls. "He could sow wheat so there would not be a bare spot in the whole field. He was a farmer and could do anything there was to do just a little better than anyone else." President Truman is still joint owner, with his sister Mary Jane and brother Vivian, of the Grandview farm, now somewhat smaller, and operated by his brother, who is assistant director of the Federal Housing Administration's Kansas City office. Vivian Truman also carries on the family's livestock business.

According to *This Man Truman* (1945), Harry Truman's father had always taken an

TRUMAN, HARRY S.—*Continued*

active part in local politics as one of the Pendergast Democrats. From 1906 he served as elections judge in Grandview precinct, usually with his son Harry as clerk, and for the four years before his death he was road overseer for the southern half of Washington township. Young Truman, whose brother had moved away a few years earlier, succeeded his father as road overseer, his first political appointment. This required him to spend his spare time collecting taxes, repairing culverts and bridges, and dragging dirt roads after the rain with an eight-mule grader, for a salary of five dollars a day. In spite of its humble nature, the road overseer system was (to quote a Missouri newspaper) "the backbone of the Jackson County Democratic organization," and when Truman resigned this post because of a disagreement with his superiors over the need for improvements, he was appointed postmaster at Grandview with the support of Democratic Congressman William P. Borland. However, Truman turned over both the duties and the fifty-dollar monthly salary of this post to his assistant, Ella Hall.

Harry Truman had joined the National Guard in 1905, when he came of age, and had been honorably discharged as a corporal at the end of his second enlistment in 1911. "After reading all the books I could obtain in the Independence and Kansas City public libraries on history and government, from early Egypt to the United States of America," he once explained, "I came to the conclusion that every citizen should know something about the military, finance or banking, and agriculture. All my heroes or great leaders were somewhat familiar with one or the other or all three." A few days after his country entered the First World War, the thirty-three-year-old farmer was sworn in as a first lieutenant, passing the physical examination, it is said, by arranging to have the examining sergeant prompt him on the eye chart.

He attended the Field Artillery School at Fort Sill, Oklahoma, and helped organize the Second Missouri Field Artillery, which became the 129th. At Fort Sill, according to the New York *Herald Tribune*, "he started a canteen by collecting two dollars from each of the eleven hundred men in his regiment. With the aid of a buddy, Eddie Jacobson, who had had mercantile experience, he built up the canteen until in six months it not only refunded the two dollars apiece but accumulated fifteen thousand dollars in dividends for the regiment."

Thirty-three-year-old Truman was sent overseas in March 1918 with the Thirty-fifth Division as captain and adjutant of the Second Battalion, and after further training was given command of Battery D, 129th Field Artillery in the same division. This battery was known as "a hardboiled bunch of Kansas City Irish" who had worn out five previous captains and greeted this one with marked skepticism. But the quiet, bespectacled farmer won their respect and affection, as he led them through the Saint-Mihiel, Vosges, and Meuse-Argonne offensives. Two specific incidents are remembered of him. Once he ignored a colonel's ill-advised order to move his men in double time to another sector, and once, when his panicky battery was on the verge of a disorderly retreat, he gave them a "bawling-out in no-man's land" which restored their morale. Truman's battery fired their last volley of the war at Herneville, France, fifteen minutes before the start of the Armistice. He returned to the United States and was discharged with a reserve commission in the rank of major and appreciable skill in jujitsu. On the trip home his men had put aside a percentage of each dice game to buy Captain Truman a ten-gallon loving cup which stands four feet high and is too big for his mantel. (Truman was a founder of Officers Reserve Corps Number 1 at Kansas City. In 1927 he was raised to the rank of colonel in the Reserve.)

In June 1919, six weeks after his return, Truman was married to Bess Wallace, the schoolteacher daughter of a farmer, and granddaughter of a well-known flour miller. Bess, one year younger than he and "the only girl he ever went with," had been a blond tomboy in the days when they went to the same Presbyterian Sunday School. After their marriage the couple lived with her mother. (The Trumans have one daughter, Mary Margaret, born in 1924 and usually called "Baby." Margaret, like her mother, is an Episcopalian, although Truman lists himself as a Baptist.) Then Harry Truman went into partnership with his friend Eddie Jacobson in a Kansas City haberdashery shop. "The store made out well for a while," says the New York *Herald Tribune*. "But its earnings were plowed back into inventory; its contracts were at boom levels; and when business sagged, the haberdashery was squeezed to pieces in [the deflation of] 1921." Truman, who lost his entire savings of fifteen thousand dollars and twenty thousand more, refused to file a bankruptcy petition, and saved for fifteen years to pay off his debts.

Meanwhile Truman had been active in the American Legion; during the postwar reaction of disillusionment with all things military, he urged "preparedness," and he helped frame the Legion policy of unifying the armed services under a single Cabinet Secretary—a change he still advocates. A thirty-second-degree Mason, he was for a time Grand Master of the Kansas City lodge. His family were stanch Democrats, and he had many friends among both farmers and townspeople. These qualifications appealed to Boss Tom Pendergast of the local Democratic machine, when they were presented to him by a nephew who had served with Truman in the war. Pendergast nominated Truman as one of the three judges of the Jackson County Court—not a judicial body despite its title, but an administrative one, corresponding to the county commissioners or boards of supervisors in other States. Elected in 1922, the future President took office in 1923. Coming to the conclusion that "knowing a little law wouldn't hurt," he enrolled for evening courses at the Kansas City School of Law, where he studied from 1923 to 1925, taking about half of the course required for a law degree and making a "B" average. After Truman's defeat for reelection in 1924, he helped organize the Kansas City Automobile Club, and within less than two years he "ballooned the membership to more than three thousand."

Truman's connection with Pendergast has drawn much criticism. In the light of a thorough Federal investigation which sent the boss to jail on an income tax charge in 1939, there is no doubt that the Pendergast machine was thoroughly corrupt. His henchmen won elections by "voting the ghosts"—registering votes for persons dead or nonexistent—and then used their power for their own profit. Far-reaching and most unsavory underworld connections were revealed by the investigation. But there is no doubt that Harry Truman himself was scrupulously honest at all times. According to Johnson, "The record of the Pendergast gang in Kansas City is such that any man who could work with that crowd and remain honest is honest indeed. But this means financial honesty alone. . . .Of course the [future] Senator was not acquainted with all the appalling details, but he must have known that some pretty rough stuff was going on." Some commentators point out that Pendergast gave efficient and relatively honest government at the time Truman became associated with him, and that these abuses developed about nine years later, when Truman was in Washington. When Boss Tom acquired a bad name, Truman's strong sense of loyalty caused him to stand by his friend, as he did until Pendergast's death in January 1945.

At any rate, Truman was swept out of office during the split between the Pendergast and Shannon Democrats in 1924; but two years later, having failed of nomination to the twenty-five-thousand-a-year county collectorship, he was elected Presiding Judge of the County Court, an important post, as Jackson County includes Kansas City. "I had charge of the spending of sixty million dollars for highways and public buildings in Jackson County" for the eight years from 1927 to 1935, Truman recalls. "Nobody ever found anything wrong with that, and it wasn't because they didn't look hard either. We built more miles of paved roads in Jackson County than any other county in the Nation, with two exceptions." Once, however, he did have a thirty-six-thousand-dollar surplus left over from four and a half million appropriated for the Jackson County courthouse. "Instead of returning the surplus to the treasury," the President confesses, "I spent it on a statue of Andrew Jackson." During these years Truman became an important figure in the County Judges Association, one of the most powerful political organizations in the State. Missourians remember Judge Truman as "harping day and night on cutting taxes and preaching constantly his theory of economy and value received in government expense, as in business." He realized fully that "the costs of government can be cut only by eliminating some services and equalizing the burden. It is an economic problem and must be handled in an economic manner." In 1930 the Odessa County *Democrat* started a gubernatorial boom for him, but he was overwhelmingly re-elected to the County Court. According to Cyril Clemens' *The Man From Missouri,* Truman leaned over backward to be honest, to such an extent that he refused to pay his mother for the eleven acres taken from her farm for a county boulevard, although she was entitled to eleven thousand dollars in compensation.

After eight years in that sixty-three-hundred-a-year post, Truman asked Pendergast to nominate him for a more lucrative one. According to the story most prevalent, he asked for the tax collectorship, but received instead a United States Senatorship at ten thousand dollars. Truman himself says he asked for nomination to represent a new Congressional district which had just been formed, but found that the machine's support had already been pledged to C. Jasper Bell. Some weeks later, while Judge Truman was touring the State in support of a bond issue, the Democratic State chairman persuaded him to accept the nomination for the higher chamber.

Elected to the Senate in 1934 by a plurality of 262,000 votes over his nearest opponents, Truman followed Pendergast's advice to work hard, to keep his mouth shut until he knew the ropes, and to answer his mail. As his secretary, Mrs. Truman assisted in the carrying out of the last-named directive—at an annual salary of forty-five hundred dollars. (This practice of employing a member of one's family is not uncommon among Government officials without large private incomes. The salaries of Federal public servants are customarily inadequate for expenses of the office, one of the reasons being that they were usually determined long ago.) The modest four-line biography with which he furnished the *Congressional Directory* was less than one-tenth the length of that given by his friend Bennett Champ Clark['41], senior Senator from Missouri. Truman differed from Clark in other ways, too, for Clark was an isolationist and an opponent of many of President Roosevelt's New Deal policies. Truman, on the other hand, "went down the line for the Administration" when it came to a vote for the original AAA Act, the Wagner['41] Labor Relations Act, the Social Security Act, the TVA, joining the World Court, and building the Florida Ship Canal and the Passamaquoddy Dam. He did vote to override the veto of bonus payments to World War veterans.

In 1937 Senator Truman first came into national notice: he presented a bill for the Federal licensing of operators of motor vehicles used in interstate traffic, and he served as chairman of two Interstate Commerce subcommittees. One of these subcommittees drafted the Civil Aeronautics Act which brought all nonmilitary aviation under control of the Civil Aeronautics Authority. The other subcommittee under Truman's chairmanship drafted a bill which became the Railroad Transportation Act of 1940. This was preceded by an extensive investigation of railroad financing. "When it came to digging into the Missouri Pacific," writes Charles T. Lucey of the Scripps-Howard['40] staff, "names of politicians and others in Missouri began to bob up. Telegrams and telephone calls poured in on Senator Truman asking him to ease up on that home-state stuff. Boss Pendergast was one of those who turned on the heat. But Mr. Truman told his committee investigators, 'I don't want you to ease up on anything. Treat this investigation just as you do all the others.'" Investigator Max Lowenthal told a St. Louis *Post-Dispatch* reporter that in his opinion "there were not two other Senators who would have withstood such local political pressure as Senator Truman did."

During the investigation of the Pendergast regime by United States District At-

TRUMAN, HARRY S.—*Continued*

torney Maurice M. Milligan, Truman was referred to as "Boss Pendergast's errand boy," but he refused to "desert a sinking ship." When the Senate was asked to confirm President Roosevelt's renomination of Milligan in 1938, Truman "fought it tooth and nail," says George Creel '44, "branding Milligan as 'personally obnoxious,' and going so far as to intimate that his investigation of election frauds in Kansas City was inspired by political animus. True," comments Creel, "this was a full year before the indictment of Tom Pendergast, and only small fry were involved, but the Senate majority regarded the attack as unfair and rebuked it by an overwhelming vote." (Five years later Vice-President Truman was to succeed in preventing Milligan's reappointment. Truman, however, has a reputation of not holding grudges.)

By the time Senator Truman was up for re-election in 1940, the Democratic registration had lost some forty-seven thousand names of nonexistent voters. Truman seemed to have no chance to win. But his two opponents for the nomination, District Attorney Milligan and Governor Lloyd C. Stark, each claimed the credit for ridding Missouri of the Pendergast gang. They split the anti-machine vote and "killed each other off," allowing Truman to win the primary election by the slim margin of 7,000 votes, and the general election by 40,000. Nevertheless, he is quoted as saying. "I could have won if only one of them was running."

Back in Washington, the Senator began getting letters from Missourians complaining about waste in construction at Fort Leonard Wood, and stating that defense contracts were going almost exclusively to the large corporations connected with members of the War Department's Construction Advisory Board. In February 1941, after a personal tour of investigation, Truman submitted a bill creating a Senate committee to look into the situation; and in March that body created the Special Committee to Investigate Contracts under the National Defense Program, which soon became nationally known as the Truman Committee. It set something of a record by probing controversial matters, yet always emerging with a unanimous report.

In view of the committee's fame and accomplishments, the modesty of its establishment is not generally realized. Truman was given five first-term Senators: Democrats Carl A. Hatch '44 of New Mexico, James M. Mead '44 of New York, and Mon C. Wallgren of Washington; and Republicans Joseph H. Ball '43 of Minnesota and Ralph O. Brewster of Maine. One Senate veteran, Tom Connally '41 of Texas, was added to keep the freshmen under control. Every member was serving also on other committees, Truman himself on six others: the important standing committees on Appropriations, Military Affairs, and Interstate Commerce; and the Enrolled Bills, Printing, and Public Buildings and Grounds committees. Later additions to the Truman Committee were Clyde La Verne Herring of Iowa, Harley Kilgore '43 of West Virginia, Harold H. Burton '45 of Ohio, and Homer Ferguson '43 of Michigan, bringing the membership to six Democrats and four Republicans. (Photographers were never able to catch the entire committee together.)

The first appropriation was only fifteen thousand dollars. The entire staff, housed in four offices, consisted of fifteen investigators, eighteen stenographers, clerks, and the well-thought-of committee counsel, Hugh A. Fulton. Truman had appointed him on the recommendation of Attorney General (later Justice) Robert H. Jackson '40, who knew Fulton's work as an assistant district attorney in New York. The Truman Committee's first report was issued in August 1941. It presented sensational facts in ninety-eight completely unsensational pages. After studying nine Army camps, the committee outlined the "needless waste of one hundred million dollars" in Army construction and "fantastically poor judgment" in various matters. General Brehon Somervell '42, whose Services of Supply frequently was brought up short by the Truman Committee, estimates that this inquiry alone saved the Government two hundred million dollars.

Truman Committee reports were responsible for causing President Roosevelt to abolish the bumbling Supply Priorities and Allocation Board in favor of the one-man Office of Production Management in January 1942; and then when Truman, among other revelations, showed how many of the dollar-a-year men were lobbyists for their own businesses, caused the OPM to be reorganized as the War Production Board. Later reports exposed the cartel agreement between Standard Oil of New Jersey and the German I. G. Farbenindustrie; the responsibility of the big steel companies for the scrap shortage; Army-Navy rivalry and duplication of facilities; "negligence or willful misconduct" in the Navy's Bureau of Ships; imperfections in fighter aircraft; malpractice by labor unions; and the lack of central authority in coordinating the war program. (In the meantime, Reserve Colonel Truman had applied to Chief of Staff Marshall '40 for active service and been refused.) By September 1943, according to Stanley High, the committee had received appropriations of only two hundred thousand dollars, "doled out by the Senate in driblets"—a small fraction of that given Martin Dies '40 for his Committee to Investigate Un-American Activities. So effective was the Truman Committee as "the public's most accessible court of appeals, the sharpest prod, and one of the most powerful action-getting agencies in the Government," that much of its work became preventive. "To insure quick action on Truman facts, numerous war agencies, among them the War and Navy departments, the Maritime Commission, and the War Production Board, have representatives attached, full time, to the committee." Altogether, the Truman Committee (which was to become the Mead Committee when Truman left the Senate) was considered a model of its kind.

At the Democratic National Convention in July 1944 there was little doubt that President Roosevelt would be renominated for a fourth term, and interest centered on the selection of a Vice-Presidential nominee. The CIO-PAC and the liberals and Leftists generally were strongly for the renomination of Henry Wallace '40. The Southern conservatives backed Presidential assistant and former Supreme Court Justice James F. Byrnes '41, and other segments of the party had other candidates. Soon it became clear that each of the possible candidates, with the exception of Truman and Justice William O. Douglas '41, had heavy political liabilities. Truman had no desire for the honor ("I've got the best job a man could have," he said), and he had in fact agreed to make a speech nominating Byrnes. But he was the choice of Democratic National Chairman Robert Hannegan '44. The A. F. of L. leaders and the railway brotherhoods were for him rather than Douglas, and all other groups found him acceptable as "the second Missouri Compromise."

Liberals approved his voting record, and conservatives felt that "at heart he was an old-fashioned Missourian, not a 'Pink' or reformer." Southerners liked his Confederate background; Negroes and anti-discrimination groups recalled that he had consistently voted their way. The machine bosses knew him as an organization man. But the defect of his virtue was also in evidence: if Truman inspired no denunciation, neither did he inspire wild applause—even at the convention at which he was nominated, the defeated Henry Wallace outshone him. During the campaign it was charged that Truman had belonged to the terroristic Ku Klux Klan in 1922, but his categorical denial was generally accepted. Apart from that, he was frankly the tail to Roosevelt's kite and was elected as such.

As students of government know, the Vice-Presidency of the United States carries few real duties. The Vice-President is supposed to preside over the Senate, but in practice this is usually done by a president pro tempore; the incumbent himself serves as an "understudy" for the President. Truman's plan, according to Luther Huston, was to "be the politician's Vice-President. . . .He will have a hand in shaping legislation and steering it through the Senate; will operate behind the scenes to keep fences patched and curb feuds, and may even be more zealous at times than [former Vice-President John N.] Garner in championing the programs of the Administration." In his spare time Truman continued his study of history and military strategy. For the first time, the Trumans began to take a noticeably active part in the Washington social scene, although the women continued to do housework in their modest five-room apartment. Margaret was attending George Washington University and singing during the summer in Denver Opera Company productions. "She's getting what I never had, a college education," her proud father told people. (Truman's mother-in-law, a Missouri pioneer, was also a member of the household.)

But Truman was to serve as Vice-President only eighty-three days before he was catapulted into the highest office in the country. One of his official actions in those few months, a move which puzzled some observers, was his committing of the bill for a Missouri Valley Authority on the order of the TVA to the Senate Commerce Committee, where Chairman Josiah W. Bailey '45 was known to be hostile to the proposal, rather than to the Agriculture Committee, as the author of the bill had requested. He himself was considered favorable to the proposal, however. For the immediate future, Truman was preparing to lead the Senate fight on accepting the world monetary stabilization plan proposed at Bretton Woods. Then, on April 12, 1945, Franklin Delano Roosevelt died, and sixty-year-old Harry Truman succeeded to the Presidency. As such, he had one privilege never accorded Roosevelt: unlike an elected President, a Vice-President who succeeds to the White House can designate his own "heir apparent," for the Presidential succession after him (in case of his own death) is made up of the Cabinet members in the order of their Departments' seniority. Observers therefore watched with particular interest to see whom, if anyone, Truman would choose to replace Secretary of State Edward R. Stettinius '40, the first in the line of succession. His eventual choice was Judge Byrnes, appointed June 30, but in a special message the President asked Congress to pass an act establishing a new order of Presidential succession. He recommended that the Speaker of the House and the President of the Senate precede the Cabinet members, so that the country might have an elected rather than an appointed heir-apparent.

President Truman took office at "surely one of the most unpropitious moments in history" for a change of leaders; he himself had pointed out the dangers of a change of Presidents in his campaign speeches against Dewey '44. The nearness of the San Francisco Conference of the United Nations, scheduled to open thirteen days later, threw into sharp relief the problems facing the new President. He must of necessity take a leading part in winning the war, making the peace, dealing with the enemy nations, reconverting from a wartime to a peacetime economy, helping the wartorn lands, and putting into concretion the overwhelming desire of his people that "this must be the last war." Millions of plain people, who had felt that "you could leave things to Roosevelt," realized anew the immensity of the task confronting the American President, and wondered what might be expected of Truman. One comment was that he had inherited a whirlwind.

"An awful, awful lot of GI's never heard of Harry Truman, who among other things is now their Commander in Chief," said CBS reporter Bill Slocum, from Paris. Curiosity about the little-known new President was world-wide, and mingled with the grief at Roosevelt's passing. There was even some question about his number in the succession of Presidents (caused by the fact that Grover Cleveland had served two nonconsecutive terms, and was therefore counted by some as two Presidents). Truman is the thirty-second man to hold the office. The questioning public learned, too, that he was the first President, as he had been the first Vice-President, from Missouri, and the second President from west of the Mississippi. From Missourians, such as Roy Roberts of the Kansas City *Star,* they heard such descriptions as this: "Humility probably would be the first characterization. Then loyalty, perhaps excessive loyalties that sometimes get high officials into trouble; common sense; deep patriotism; and above all an abiding faith in his country and its democratic system. Harry Truman couldn't go in for personal government under any circumstances. He doesn't believe in it and wouldn't know how to operate it."

The new President's first official announcement after being sworn in was that the San Francisco Conference on International Organization would convene as scheduled; and within two days he had won praise by successfully re-

TRUMAN, HARRY S.—*Continued*

questing Stalin '42 to send Foreign Commissar Molotov '40 to the Conference, instead of having the U.S.S.R. represented by the regular Ambassador to the United States. At his first press conference Truman endorsed Bretton Woods, continuance of the reciprocal trade policy, and American participation in the United Nations organization. Truman's first appointment, after members of his personal staff, was that of the St. Louis banker and RFC director John Snyder '45 as Federal Loan Administrator. Later, in July 1945, he was to appoint Snyder to the over-all planning post of Director of the Office of War Mobilization and Reconversion—"Secretary of Domestic Policy."

Other much-publicized appointments were: April 27, Edwin Pauley '45, California oil and real estate man and Democratic treasurer, to the Allied Reparations Commission; May 2, Supreme Court Justice Robert H. Jackson as chief American prosecutor at the German war criminals' trials; May 7, Democratic National Chairman Hannegan of St. Louis as Postmaster-General; May 23, Assistant Attorney General Tom C. Clark '45 of Texas as Attorney-General, Judge Lewis B. Schwellenbach '45 of Washington State as Secretary of Labor, and New Mexico Representative Clinton P. Anderson '45, chairman of the House Food Investigating Committee, as Secretary of Agriculture; June 7, liberal young businessman W. Stuart Symington '45 of St. Louis as chairman of the Surplus War Property Board, and General Omar N. Bradley '43 as head of the Veterans Administration. Twenty days later Truman named Stettinius to the United Nations Security Council and then replaced him in the Secretaryship of State with Judge Byrnes. Economic Stabilization Director Fred M. Vinson '43, six-term Representative from Kentucky who had established himself as a tax expert before appointment to the Federal bench, was named Secretary of the Treasury on July 16; Senator Burton was nominated to succeed retiring Justice Roberts '41 on the Supreme Court September 18. A significant appointment was that of Judge John C. Collett of the Missouri Supreme Court as Stabilization Administrator in September, after Truman had lost the well-regarded William H. Davis '41 by a removal, which he later reconsidered, of all price, rationing, and production control. After the dramatic resignation of General Patrick J. Hurley '44 in November, Truman named ex-Chief of Staff Marshall as special envoy to China (Marshall, Bradley, and Vinson were his only appointees to important posts who were already well-known to the country in their fields). In December he chose Wilson W. Wyatt the dynamic young mayor of Louisville, as housing expediter to deal with the acute housing shortage.

The President's executive method was described as "pick a man and let him run his own job." It was praised as a return to Cabinet government, an end to "one-man rule," and it was condemned as drifting and as lacking an over-all policy—failure to recognize that all Federal offices were dealing with different aspects of a few basic situations, not with independent problems. Truman's Cabinet, which included some hold-overs from the Roosevelt regime, was summed up by *Fortune* at the end of the year as: "five able administrators: [Secretary of the Navy] Forrestal '42, [Secretary of the Treasury] Vinson, [Secretary of War] Patterson '41, [Secretary of the Interior] Ickes '41, and [Secretary of Commerce] Wallace '40; two hard-working question marks, at present swamped by their responsibilities, Byrnes and Schwellenbach; two politicians, Hannegan and Clark; and one unknown quantity, Anderson."

Less than a month after Truman was sworn in, the war in Europe ended on May 8. In less than four months he saw his country ratify the United Nations Charter (July 28), and he joined with Churchill '42, Attlee '40, and Stalin at the historic Potsdam Conference (July-August) which determined certain frontiers, set the Allied reparations policy, and announced that Spain was not wanted in the United Nations. Four days later he announced the existence and first use of the atomic bomb, and on August 14 he proclaimed the surrender of Japan. Meanwhile, of course, he continued the endless Presidential routine of choosing subordinates, receiving their reports, granting pardons and commutations of sentences, dealing with Congress, hand-shaking, mending political fences, creating and awarding medals, accepting gifts and honors, making speeches, conferring with diplomats, greeting distinguished visitors—including Herbert Hoover '43, with whom he discussed the food situation in Europe, and Alf M. Landon '44, 1936 Republican nominee for President, who said Truman had an "excellent" foreign policy. Other invitations to the White House went to former Vice-president John Nance Garner and 1944 Republican candidate Thomas E. Dewey; and it was observed that labor leaders ceased to be frequent visitors. Before the end of 1945 the President found it necessary to order the seizure and operation of more than a dozen petroleum refineries, machine works, coal mines, textile mills, rubber plants, railroad and truck lines (including the entire Chicago trucking industry) to keep these basic facilities from being shut down by industrial disputes; and he was asked to take over many more. Truman's generally "hands-off" labor policy was in contrast to that of the preceding twelve years, in which the Government acted as an interested party; and it has been suggested by *Fortune* that this factor was responsible for the failure of the labor-management conference the President called in November.

The man from Missouri had an unprecedentedly high degree of popularity during the "political honeymoon"—the classic hundred days' grace before a President's opponents settle down to opposing his policies and criticizing his personality. His popularity with the people, as indicated by surveys, remained high throughout the year: Elmo Roper's '45 December 1945 survey found 75.6 per cent classifying his conduct of foreign relations as excellent or good, 64.7 per cent (including more Republicans than Democrats) saying the same of his handling of Congress, and 58.9 per cent approving his handling of home problems. Four months earlier, approval of his internal and Congressional relations had been about five points higher, but approval of his relations with foreign countries had been 3.3 per cent lower.

Truman's legislative program—enough, it was said, to keep Congress busy for several sessions—was in the New Deal tradition on most or all points. His twenty-one-point message of September 6 included requests for increases in the minimum wage and unemployment benefits, a permanent FEPC, early action on the full employment bill, continuation of Federal control of the employment service, a single agency for Government scientific research and for promotion and support of science, and protection and encouragement of small business. It backed the "revolutionary" Wyatt housing program for ten to fifteen million houses in ten years, and asked for a program of regional development of the Nation's river valleys, crop insurance, research on agricultural problems, and the use of five hundred surplus Lend-Lease millions for the Commodities Credit Corporation to support prices. His viewpoint on public works and provision for veterans were in line with Roosevelt's, and he went further than his predecessor in recommending a five-point program for the country to "safeguard the health of all its citizens" by making provisions for adequate medical care for all. Despite the economies Truman had effected and the further decreases he had promised, he recommended the raising of Federal salaries—to twenty thousand a year in the case of Congressmen—and an "adequate" retirement system. He was not New Deal, however, when he approved a bill to place the hundred and one Government corporations, such as the TVA, RFC, HOLC, SWPC, under "annual scrutiny by Congress and . . . current financial control thereof," thereby ending the flexibility and quick action which were the corporations' reasons for being, and opening them to Congressional patronage. Unlike Roosevelt, too, Truman left the disposal of his proposed laws to Congress, engaging neither in political maneuvering for their passage nor in head-on fights with opponents.

Of the President's more than two dozen major proposals to Congress, five were passed: one-man administration of the huge job of surplus property disposal, funds for UNRRA, the formula for disposing of surplus ships, and participation in Bretton Woods and the United Nations. Five were drastically revised by the legislators: a "high level" employment planning program, retention of wartime Executive powers, lowered taxes, and authority to reorganize the Executive branch (thirteen agencies were wholly or partially exempted, contrary to the President's request). At the end of 1945, the rest had not been passed. This was in contrast to most people's expectations, as Truman had gone out of his way to maintain friendly relations with Congress. On the first day of his Presidency he had gone to the Capitol for an unprecedented luncheon conference with Congressional leaders, and eight days later he had invited the president pro tempore of the Senate, Southern Democrat Kenneth D. McKellar, to occupy the Vice-presidential seat at Cabinet meetings. Nevertheless, the same Republican-Southern Democratic coalition which had hampered Roosevelt seemed to have Truman's program blocked.

A striking difference was noticed between the President's public popularity and the tone of published comment after the first three months. Apart from ordinary partisanship, certain of his policies and actions brought unfavorable comment: the sudden removal of price control and rationing after V-E Day, and their restoration in September; the legally correct but undiplomatically and, for the borrowers, uneconomically, abrupt termination of Lend-Lease seven days after the Japanese surrender, a move approved by 49.4 per cent of the Nation, and by 19.6 per cent fewer Democrats than Republicans. His expressed hope that labor and management would "cut out all this foolishness and strikes and get back to work," did not endear him to either side; his oft-cited remarks that he had not wished to be President, and "sometimes I forget I'm President," drew ironic comment. The latter quotation might perhaps summarize the main faults found with him: that he appointed men who were too small for their jobs ("Truman's midgets") and leaned too heavily toward fellow-Missourians; that he lacked regard for his personal safety; that he offended important Congressmen by keeping in much closer touch with the clerk of the Senate, Leslie Biffle; that, although known to be a hard, long, and efficient worker, he took days off in a time of crisis for recreation; that he had continued Roosevelt's policies, but failed to fight for them, and had appointed men not in sympathy with their objectives to carry them out; that he was neither dynamic nor inspiring; that, in short, he was not a leader. General opinion seemed to agree with the *New Republic* estimate of him as "a well-intentioned, politically minded middle-roader, of higher caliber than some feared and of weaker leadership than some hoped."

Harry S. Truman is five feet ten, and "can still get into his World War uniform if the buttons are well anchored" (he weighs one hundred sixty-seven pounds). His hair is gray, with traces of black still remaining, and he has a bald spot; his eyes are hazel, and the spectacles he wears tend to magnify them. The President, who "never has a sick day," says he has no hobby or favorite sport; his only exercise is walking and calisthenics after he rises at six-thirty. Truman never smokes, and dislikes seeing women smoke. He drinks moderately, plays the piano—and a much better game of poker than he admits. One Missouri reporter solemnly told his readers that Harry Truman "cusses, but you notice that he avoids blasphemous profanity." He is a student of history, and can discuss past military campaigns in "astonishing" detail. Since becoming President, he has added, to his studies in American history, research on the life and times of Andrew Johnson, the former tailor who succeeded Abraham Lincoln just eighty years before Truman succeeded Roosevelt. President Truman calls himself a politician. "Government is politics," he has said, "and government which is not in the hands of skilled and honest politicians is less likely to be good government."

TRUSCOTT, LUCIAN K(ING, JR.) Jan. 9, 1895- United States Army officer

Address: b. c/o War Department, Washington, D.C.; h. Charlottesville, Va.

Lieutenant General Lucian K. Truscott, once called by *Time* "the ablest sea-to-land commander in the United States Army," succeeded General George S. Patton '43 in command of the Third Army occupying Bavaria in October 1945.

U.S. Army Signal Corps

LT. GEN. LUCIAN K. TRUSCOTT

Born in Chatfield, Texas, on January 9, 1895, Lucian King Truscott, Jr., is the son of Lucian King Truscott, a country doctor, and Maria Temple (Tully) Truscott. On his mother's side he is of Irish descent; on his father's he is English. Lucian spent his early childhood in Chatfield, then moved with his family to Oklahoma when he was six. In 1911 he received a certificate from the normal school in Norman, Oklahoma; afterward, for six years he taught school in one-room Oklahoma schoolhouses during the winter and studied at various teachers' institutes during the summer, receiving certificates from schools in Sapulpa (1912) and Eufaula (1913). Lucian's grandfather, for whom the town of Truscott is named, had helped found the Texas Agricultural and Mechanical College.

Enlisting in the United States Army during the First World War, the former schoolteacher was assigned to Officers Training Camp at Fort Logan H. Roots, Arkansas. Commissioned a second lieutenant of Cavalry in the Officers Reserve Corps on August 15, 1917, he was assigned to the Seventeenth Cavalry at Douglas, Arizona. On October 26, 1917, he was commissioned a second lieutenant of Cavalry in the Regular Army and on the same day was promoted to first lieutenant (temporary). Two months later his lieutenancy was made permanent.

Young Lieutenant Truscott in March 1919 was transferred with his cavalry unit for duty at Schofield Barracks, Hawaii, where he was stationed for the next two and a half years. During this period he was promoted to captain. Returning to the United States in October 1921, Captain Truscott was assigned to duty at the Presidio at San Francisco. His assignment there was short-lived, for within two months he was transferred to the First Machine Gun Squadron at Douglas, Arizona. Transferred again almost immediately, in February 1922 he was assigned to the First Cavalry at the same post, where he stayed for three and a half years. At the end of this time he was assigned to Fort Bliss, Texas, for service with the Eighth Cavalry.

In October 1925 the Captain entered the Cavalry School at Fort Riley, from which he was graduated the following June. One year later, having completed his course in the Advanced Class, Truscott became an instructor at the school. His next assignment was to the Third Cavalry at Fort Myer, Virginia, where, beginning in June 1931, he served for a little less than three years. In March 1934 he went to Mexico as a member of the United States Army polo team. An expert player, he helped to defeat the Mexican Army team, then in May returned to his former duties at Fort Myer. Three months later he enrolled at the Command and General Staff School at Fort Leavenworth, Kansas, completing his course in June 1936. While at the school he was promoted to major.

After graduation Major Truscott remained at the school as an instructor, a post he held until September 1940. At this time he was appointed executive officer of the Second Battalion of the Thirteenth Armored Regiment at Fort Knox, Kentucky, and a few months later he became operations officer of the regiment. In July 1941 he went to Fort Lewis, Washington, joining the Ninth Corps General Staff as assistant to the plans and training officer, G-3. Three weeks after the bombing of Pearl Harbor he became a colonel (temporary), and in May 1942 he was promoted to brigadier general (temporary).

That same month the new general was sent to England and attached to Admiral Lord Louis Mountbatten's '42 combined operations staff of the British Army, Navy, and Air Force. Assigned to organize an American counterpart to the British Commandos, Truscott visited every Commando training unit in England and Scotland. The outcome of this inspection tour was an American Ranger unit, the first of its kind, which he organized and trained. These Rangers of Truscott's took their name from Rogers' Rangers—crafty frontiersmen who in Colonial days had fought the French near the Canadian border under their leader, Major Robert Rogers. (Later, in the American Revolution, Rogers fought on the side of the British.)

All of Truscott's Rangers were volunteers, chosen for their adeptness in using mortars, daggers, grenades, or tommy (submachine) guns. Describing the intensive training which the Rangers had to undergo, Rice Yahner of the Associated Press has written: "The men drilled at double time until their feet blistered and their lungs were bursting. When their legs were ready to fold, they started again. . . . Then they got climbing and diving and crawling over obstacles and crossing a bridge made of the seven-foot ropes which each man carries. . . .Then a thirty-six-mile hike over bleak, trackless mountains, with only half-rations and what the men could forage from the countryside." Truscott, their leader, was "hard as hell, drove the men, but outdid the best of them." When the Rangers were ready for action, Truscott, as the ranking American officer, joined in the planning of the Dieppe raid. In August 1942 American Rangers, Canadians, Free French, and Mountbatten's Commandos launched a land, sea, and air raid on the little French town. Although the attackers suffered heavy casualties and the operation was unsuccessful, the Allies learned much about invasion technique that was useful in later landings.

In the invasion of North Africa in November Truscott led a special task force to capture Port Lyautey in French Morocco. That same month he was made a major general (temporary). On December 15 he was awarded the Distinguished Service Medal. The citation, in part, said: "For exceptionally meritorious service in a duty of great responsibility. General Truscott organized a wholly strange command . . . and planned operations in a manner that demonstrated organization and administrative ability of the highest order. His conduct of the landing operations . . . resulted in the capture of Port Lyautey, with its harbor, against superior enemy opposition. He exhibited tireless activity and devotion to duty and complete scorn of personal danger."

During the battle of Tunisia in the winter of 1942-43 Truscott was field deputy to Allied Commander Dwight D. Eisenhower '42. At the close of the North African campaign, Truscott became commanding general of the Third Infantry Division—the "Rock of the Marne Division" of the First World War, which had existed as a Regular Army unit between the two wars. Truscott at once established a rigorous training program for his Third Division. Intent on making his soldiers the "fastest, toughest marchers in the Army," he increased the infantry marching speed of two and a half miles per hour to five miles per hour the first hour, four miles per hour for the next two hours, and three and a half miles an hour for the remainder of the distance. The men soon referred to these exhausting "hikes" as the "Truscott Trot." However, it was this trot and Truscott's driving hatred of the Germans that helped to make the Third Infantry Division a powerful fighting unit.

In the battle of Sicily in July 1943, Truscott's Third Division found that their weeks of intense training had been very profitable. Landing at Licata on the southern coast of Sicily, they fought northward towards Agrigento. After a week's battle in Agrigento, they marched a hundred miles in five days from that city to Palermo. *Life* Magazine refers to this operation as one that is already "classic in military annals for speed and success." For his "extraordinary heroism . . . intrepid direction . . . heroic leadership . . . superior professional ability," Truscott received the Distinguished Service Cross. From Palermo men moved eastward through mountainous terrain, in record time; in September they made two amphibious landings on the Italian mainland to capture Messina. In the words of one Army officer, "What Truscott did in Sicily was to turn his infantry into a cavalry." Truscott was awarded the Legion of Merit in August of the same year.

From Messina the Third Division was rushed to Salerno to reinforce the battered troops of General Sir Oliver Leese's '44 British Eighth Army. Pushing northward, the Allies then took Naples in October. At the Volturno River, north of Naples, a stubborn German Army found Truscott a determined adversary. In a desperate effort to get his tanks across the river to an unprotected regiment of men who had worked their way across the Volturno in advance of the armored mobile units, the General appeared at the most advanced post, shouting to the engineers, "You've got only picks and shovels, men, only your hands, but right now they're better than guns. Let's get this job done! We've got a whole regiment over there. They'll get wiped out unless you get those tanks across." The engineers finished the bridge that day, and the tanks were able to go to the aid of the vulnerable regiment. Pressing forward, the division fought a bitter battle, which drove the enemy to the Liri Valley, thus providing a toehold for later Allied attacks. After this battle, Truscott's men were given well-deserved furloughs.

In January 1944 Truscott was appointed deputy commander of the Sixth Army Corps (of which the Third Division was a component). This division was one of the two divisions that made the original landings at Anzio. Immediately after the second German counterattack in March, which almost pushed the Allied troops into the sea, Truscott was promoted to commander of the corps. The new commander so successfully smashed a third enemy offensive that the Germans limited their action to holding the area. After the few months' Anzio stalemate the corps finally broke through to take part in the capture of Rome. According to one source, the corps has a signed certificate from Rome's chief of police stating that it was the first unit to reach the capital.

When plans for the invasion of southern France were completed, Truscott and his men were withdrawn from Italy in August 1944 to take part in the amphibious landing. Leading the assault forces, the General directed what has been called one of the outstanding operations in amphibious warfare. What is not generally realized is that more troops were put ashore in southern France at

TRUSCOTT, LUCIAN K.—*Continued*

H-Hour than had been landed earlier in Normandy at H-Hour. The early capture by Truscott's troops of three ranking German officers, one a divisional general and another in charge of invasion defenses, upset the enemy's communications and command. Attached to General Alexander M. Patch's['43] Seventh Army, Truscott employed surprise attacks and fast flanking movements to catch the enemy off guard. Consequently, the Allied forces drove through southern France with incredible speed. Within nineteen days they had taken Lyon. Truscott planned for an early junction at the Belfort Gap, near the French-German-Swiss border, with American troops driving southeast from Normandy. The speedy and successful carrying out of this plan cut off thousands of Germans in southern France. On September 2 Truscott was promoted to lieutenant general (temporary).

At the end of the year, in December, General Truscott was sent back to Italy and made commanding general of the Fifth Army, succeeding General Mark Clark['42] who was given command of the Fifteenth Army Group. Under Truscott's command the Fifth Army continued its push north on a seventy-mile front, from the Ligurian coast of western Italy to Imola, a city about twenty-five miles south of Bologna. Progress was greatly impeded by bad weather and the mountainous terrain, and it was not until April 21, 1945, that Bologna, communications hub of the Po Plain, fell to the Allies. On April 30 General Mark Clark said, "The German armies in Italy have been virtually eliminated as a military force by the shattering onslaught of the Allies." A few days later, on May 2, the German armies in Italy surrendered unconditionally.

The Fifth Army "became unoperational" on the second anniversary of its landing at Salerno; the men were sent home for discharge in September 1945. The next month, their commander was given charge of the Third Army and the Eastern Military District (more than half the American zone of occupation), succeeding the spectacular General Patton, who had expressed disagreement with Supreme Commander Eisenhower's denazification policy. This appointment placed Truscott in military control of Bavaria, and on October 26 President Truman['45] made him a permanent brigadier general. "Truscott has made a very good impression on his own men and on the press representatives here generally," reported Victor Bernstein of *PM*. "And in place of the clerico-fascist Friedrich Schaeffer, the new government of Bavaria now has a mild Leftist cabinet headed by [returned exile] Wilhelm Hoegner, Social Democrat, as prime minister, and including three other Social Democrats and one Communist minister without portfolio who has been given the key job of denazification. The new Cabinet," he added, "is not pure red, or even pure pink. At several spots it smells, if not of brown cloth, at least of black."

Truscott saw his first task of reform as educating his own soldiers to the realities of the situation. There was a constant flux and shift of personnel, with resulting confusion; but beyond that was the problem of men without combat experience, who had never encountered the Germans except as a defeated nation and were therefore open to "a widespread attitude of laxness and cordiality toward all Germans" without distinction. Bavaria had a normal population of eight million; but despite the absence of its young men, the total was increased to a million and a half more Germans—by refugees from bombed areas and deportees from Czechoslovakia—plus half a million displaced persons of other nationalities, housed by December in two hundred and twenty UNRRA camps. Truscott reported that disorder in general was less than in a comparable area in the United States, and stated that the closest watch discovered no sign of an underground movement, no attempt at sabotage, and no concerted opposition to American authority. Commenting on the vastness of the occupation problem, Anne O'Hare McCormick['40] wrote, "a great many officers are performing an unprecedented and supremely difficult job with impressive competence and devotion."

"Gray-haired, with a jutting jaw and squinting gray eyes," the General is described as a handsome man. Unorthodox in his military dress, he wore a shiny, enameled helmet, a weather-stained jacket, a white silk scarf, and his "lucky" faded dress cavalry breeches and boots. Even in the field, *Life* said he insisted that flowers be put in his tent every day and that his meals be prepared by a Chinese-American cook. His men were said to admire and respect him. General Truscott was awarded two foreign decorations in 1943—the Legion of Honor in the degree of Officer, from General Giraud['42], and the Honorary Companion of the Most Honorable Order of the Bath, from Great Britain's King. In 1919 Truscott was married to Sarah Randolph, a descendant of the Thomas Jefferson branch of Virginia's Randolph family. They have three children, two sons (one of whom in 1945 was studying at West Point), and one daughter. Polo is the General's favorite peacetime sport.

TUCKER, SOPHIE 1884(?)- Entertainer

Address: b. c/o William Morris, 1270 Sixth Ave., New York City

The "Last of the Red-hot Mamas," Sophie Tucker, has been booming her throaty tones for almost two score years: she began her career in 1906 in the heyday of American vaudeville, and has, through night-club appearances, survived its decline and fall. Endowed with the determination, stamina, and spirit of a good trouper, and with a personality and voice which match her generous proportions, this vaudevillian has won audiences not only in the United States, but in the British Isles and on the Continent. Her autobiography, named for her theme song, "Some of These Days," and published in the spring of 1945, gives a hearty account of her full life.

Sophie Tucker was literally born "on the road." In 1884 her mother was traveling by wagon out of Russia on her way to join her husband in America, when the child was born. The family name was originally Kalish, but on his journey to America, the father took the name of a dead friend. Miss Tucker describes the circumstances: "Papa, who had a terror of the Russian authorities reaching out and grabbing him and shipping him to Siberia for life, prudently helped himself to the Italian's papers and moniker. Don't ask me what the United States immigration officers made of an Italian who couldn't speak anything but Russian and Yiddish; but it was as 'Charles Abuza' that Papa got into this country, and found a job in Boston."

Hence, in 1884, at the age of three months, Sophie Abuza arrived in Boston, where the family lived for eight years—Miss Tucker remarks regretfully that nobody has ever admired her "Harvard accent." They moved to Hartford when the father bought a restaurant there. With her brothers, Philip and Moses, and her sister, Anna, young Sophie enjoyed the excitement of the city streets near the Connecticut River. The children had to help in the restaurant, which Sophie disliked. She hated especially the endless dish washing but obediently followed her mother's stern orders. Because she rose early to finish kitchen chores before going to school, the girl sometimes fell asleep in class.

While working at her job at the tables the young girl listened to the talk of the actors who frequented the Abuza Restaurant. She had a strong voice and would often sing popular songs in the restaurant, after which the customers would tip her. Once her mother saved enough money to buy a second-hand piano, but when Sophie neglected her piano practice, the instrument was sold. Hoping to draw customers, the girl began to sing regularly in the restaurant, winning some applause. She went to vaudeville matinees and learned the songs in the shows. But while actors complimented her singing, her parents warned her against show business. Miss Tucker recalls how thrilled she was when she served the great Jewish actors Jacob Adler and Boris Thomashefsky, who had come to eat Mrs. Abuza's cooking. These celebrities urged the girl's family to permit her to join one of the Jewish theatrical companies, but the parents firmly refused. Soon after her graduation from school, when she was sixteen, Sophie Abuza eloped with Louis Tuck. She had hoped to escape the drudgery of the kitchen, but the joy of her own small apartment was short lived. When their son Bert was born, the couple moved back with the Abuza family to ease their financial difficulties. Once more Sophie was back in the restaurant. She started singing there again, and was told her voice was better than before. About this time she was separated from her husband, eventually obtaining a divorce.

The ambitious young woman, determined to get away from restaurant chores, saved all her money and, on the pretext of going on a vacation, left home to become an entertainer. She went first to New Haven to see Willie Howard, who had advised her to try the entertainment field. The comedian told her to go to New York to try her luck. She spent her first weeks in the big city looking for work as a "song plugger" in Tin Pan Alley, with no success. When her money ran low she "sang for her supper" in restaurants. Meanwhile, she continued to frequent the offices of the music publishers, making friends and becoming known to the song writers. In 1906 she changed her name to Tucker.

SOPHIE TUCKER

In November of that year she obtained a job at a popular cafe, the German Village, singing for fifteen dollars a week. She worked herself up to leading entertainer in this place, all the while continuing to visit the music publishers for new songs. Throughout her career she has been careful about her songs, seeking new tunes continually, especially those suited to her robust style of singing. She auditioned for an amateur show at the 125th Street Theatre and overheard the manager give orders for her to appear in blackface, saying she was "too big and ugly." Thus she started her stage career in disguise, wearing blackface make-up. Joe Woods booked her on a small-time vaudeville circuit, billing her as a "World-renowned Coon Shouter." Later she played on the Park Circuit, performing in the smaller cities of New York, New Jersey, Pennsylvania, and Ohio, where she began to acquire a following. Her first New York date was at the Music Hall on 116th Street on December 9, 1906. Thereafter she played her blackface act on the New England circuit, learning from other performers and developing her technique.

Tony Pastor's Theatre in New York was then one of the city's famous entertainment centers. Miss Tucker obtained an engagement there and made elaborate preparations for her appearance. When she came on the stage, a noisy audience entering the theatre paid little attention to her. She shouted at the audience, won their attention and, soon, their approval. After seeing her act at Pastor's, a burlesque manager offered Miss Tucker a contract. She accepted, having heard that burlesque work was good theatrical training. Her first part in burlesque was a cranky old wife, and although she learned dialogue quickly, she had difficulty with the character. But despite the

TUCKER, SOPHIE—*Continued*

bad rehearsals, she was a success when the show opened.

One day while playing the burlesque circuit her trunk containing her make-up and costumes was lost, forcing her to perform without blackface. It was a triumphant moment for her when she realized she could hold an audience without the benefit of disguise. In 1909 a talent scout saw Miss Tucker in one of these shows and she was offered a part in the current Ziegfeld *Follies*. Nora Bayes was the star of this particular production, a lavish production with the usual abundance of beautiful girls. During rehearsals nobody seemed to notice Miss Tucker, who was doubtful until the last minute that she would actually appear in the show.

Finally she was assigned to a jungle scene, and at the time of her first and only rehearsal, a cold prevented her from singing. In this show she was also scheduled to fill in time between acts with songs selected by her old friend Irving Berlin '42. Opening night was a gala event, with an audience of celebrities including "Diamond Jim" Brady, Lillian Russell, George M. Cohan, and Sam Harris. Miss Tucker stopped the show with her inter-act specialty. The star objected, and Ziegfeld decided that Miss Tucker was to do only the jungle song. Years later Miss Tucker became a close friend of Nora Bayes's, but neither of them ever mentioned this incident. When the *Follies* came to New York, Miss Bayes had left the show and was replaced by Eva Tanguay, who wanted the jungle number herself. So Miss Tucker was fired. During her trying times with the *Follies*, she was befriended by a Negro maid, Mollie Elkins, who became her lifelong friend.

Back in New York, without work or money, the singer suffered a temporary loss of voice. With Miss Elkins' help she managed to start again after a brief rest. It was then she began her long association with William Morris, whose agency still manages her. Morris organized his own vaudeville circuit of American Music Halls, for which he brought to America such English entertainers as Sir Harry Lauder and Charlie Chaplin '40. Miss Tucker played this circuit with great success; she had finally attained a sense of security in her work. In Chicago, where she was especially popular, billed as "The Mary Garden of Ragtime," Ashton Stevens wrote: "Miss Tucker can move an audience or a piano with equal address. Don't miss any of her." During this period of her career, she started to use the double-entendre songs which have become closely identified with her style. She explains that she sings "hot numbers" to entertain, not to shock, insisting that all of these songs have as themes something real in people's lives. She says: "The innocents couldn't find a thing in it to object to, and the others would find a belly laugh in every line." (Jack Yellen has been writing this type of song for her for over twenty years.) Miss Tucker first saw her name in lights at an Atlantic City theater—she was a headliner at last. She made recordings for the Edison Company and sent the money she earned home to her mother. All these years she had been contributing to her family's support and had sent her brother through college.

When she was booked on the Pantages Circuit, the singer traveled West, increasing her popularity. Once in Dayton she tried a costume publicity stunt which failed because people were more interested in the airplane the Wright brothers were trying out. Back in Chicago in April 1911, after her Western tour, she accepted a part in the show *Merry Mary*. This was a failure, but her next venture, *Louisiana Lou*, was a hit. Her earnings were high but gambling took its toll. However, whenever she was in financial difficulties she would sign for a road tour and wipe out the deficit. In 1911 the Negro composer Shelton Brooks brought her his song "Some of These Days." She made it her trade mark and it has remained popular ever since.

Miss Tucker delights in telling of her return in triumph to her home town to headline the show at Poli's Theatre in Hartford. The joy of her return was increased by the presence of her son who was vacationing from military school. (Whenever she was in New York, Miss Tucker always sent for the boy.) During her next engagement she met Frank Westphal, who had a piano act, and the two became a team. In August 1914 she attained the pinnacle of vaudeville success—a date at the Palace Theatre in New York. For this engagement she earned one thousand dollars and the plaudits of both audience and critics. One critic stated, "She just walked out and owned the place." Miss Tucker married Westphal in Chicago, where the wedding party was treated to the Lohengrin *Wedding March* played by Paderewski, who happened to be in the restaurant in which they were celebrating. The couple's strenuous vaudeville schedule, Miss Tucker says, was not exactly conducive to matrimonial harmony—they played two shows daily, six or seven days a week for several seasons of "big-time" vaudeville. During the years of the First World War Miss Tucker introduced the famous song "M-o-t-h-e-r, the Word That Means the World to Me." She was changing her singing style, abandoning "coon shouting." In 1916 she toured in the show *Town Topics*. During her tours she met the great celebrities of the time, as well as many struggling vaudevillians who later rose to fame. On one bill she played with Gus Edwards' school act; among the child actors were Eddie Cantor '41, George Jessel '43, and Walter Winchell '43.

When Miss Tucker found her marriage failing she set her husband up in the garage business and continued alone. She organized a jazz band, named it "The Five Kings of Syncopation" and called herself "The Queen of Jazz." The new act was a success; Miss Tucker started dramatizing songs, an innovation which became popular. Then her father's death brought about another change in her style: she began to sing ballads—"tearjerkers"—and discovered that she could sing them effectively. This new act entailed greater responsibility for the singer, charged with the supervision of the men in the band. In December 1916 they opened at Reisenweber's, one of the leading restaurants of the day. That was the beginning of the Jazz Era and Miss Tucker and her band were a smash success. Her "Bohemian Nights" at Reisenweber's became famous; she introduced new songs and new performers. On Sunday nights she sang in concerts at the Winter Garden Theatre, where she was the hit of the 1919 season. That year she also appeared in the show *Hello Alexander*. After a summer at her Freeport (Long Island) home, among theatrical friends, Miss Tucker and Westphal were divorced. Following frequent changes in the personnel of her act, it was disbanded. Miss Tucker hired a new pianist, Ted Schapiro, who has been with her since. After playing Reisenweber's for five years she decided to try something new. Morris arranged her booking in the British music halls (equivalent of vaudeville in America), and the singer sailed for England on March 25, 1922.

Upon her arrival in England she noted the differences between the technique of the English music hall and American vaudeville and set about adapting her material to her new audience. She slowed her tempo down to British tastes and also changed some of the lyrics to follow British colloquialisms more closely. Overcoming her nervousness and becoming accustomed to the sloping British stages, Miss Tucker was a hit with the English. At a Jewish benefit at the Palladium in London, she used a duo-piano team for the first time and also delighted the audience by her remarks in Yiddish. Her tour included Glasgow, Edinburgh, Cardiff, Nottingham, Manchester, and the provinces. Everywhere she was well received, and Miss Tucker says simply: "The British are just folks, same as those in the U.S.A." Dramatic critic Hanan Swaffer expressed the British view, describing Miss Tucker as "a big, fat blond genius, with a dynamic personality and amazing vitality." While in England the singer played in the show *Round in Fifty* for three months. She made many friends in London, entertaining for "high society" and royalty. But her proudest memory of London is the reception she received at the Rivoli Theatre in Whitechapel from London's Jewish population. Before returning home, Miss Tucker visited Brussels, Berlin, and Paris.

After a triumphant return to the Palace Theatre in New York, she began a new tour, this time on the Orpheum Circuit. There was a brief stop in Hollywood for work in silent films, which was unsuccessful. The next two years were filled with steady vaudeville work, highlighted by her acquaintance with Helen Keller '42 (who appeared on the stage), and by a performance at San Quentin Prison, where the singer met Tom Mooney. In August 1925 Miss Tucker again sailed for England to fill an engagement at the fashionable Kit-Kat Klub in London. In addition to her night-club performances, the singer played in the music halls and appeared with Beatrice Lillie '45 and Gertrude Lawrence '40 in *Charlot's Revue*. One of her most popular songs in England was "My Yiddisha Mama," which audiences always demanded. Her stay in England was halted by news of her mother's illness. She broke contracts to return home, but during the voyage was notified of her mother's death. It was three months before Miss Tucker was able to sing again. She lost her self-confidence and her desire to be amusing. Finally, with the assistance of Morris, she began to sing again, first at benefits and then in her own cafe, Sophie Tucker's Playground. Eventually, fully restored, Miss Tucker went back to vaudeville. She was offered a part in Earl Carroll's *Vanities*, but after ten days among the "beauties" she left the show. At another appearance at the Palace she was billed as the "Last of the Red-hot Mamas"—and that title has stayed with her.

In 1928 Miss Tucker was once more back in London, playing at the Kit-Kat Klub, the music halls and touring the provinces. She was persuaded to take a part opposite Edmund Brean in a Greek play, *Socrates*, which thereby was transformed into an uproarious farce. In 1929, back in America, she made her first talking film, *Honky Tonk*, for Warner Brothers, but found motion pictures a difficult type of work. Returning to London in 1930 she played in a musical comedy, *Follow a Star*. (In the intervening years she had been married to Al Lackey.) After this London engagement Miss Tucker attempted performances for Continental audiences, but the language bar was a handicap. At Ostend the audience did not understand any of her songs; at her Paris opening her only knowledge of French was one chorus of "Some of These Days," which she had had translated. So she returned for a tour in England, after which she and her husband vacationed in Europe. In Vienna she discovered that her records were popular—the best seller was "My Yiddisha Mama." Miss Tucker was invited to broadcast this song in Berlin in 1931; after Hitler '42 came into power her records were ordered smashed and their sale banned in the Reich.

The singer returned to the United States to find vaudeville in its last days. The years 1931 and 1932 saw the death of vaudeville—a painful episode for the "oldtimers" who had to step aside for the new motion picture idols. But although her pride suffered, the singer continued her active career. In 1934 she played at the Hollywood Country Club in Florida. (At about this time she was divorced from Al Lackey.) Cafe business was bad; besides films, there was now radio competition. In 1934 Miss Tucker was back in England, performing in the big cities and provinces. That year she gave a command performance for King George V and Queen Mary. On her return to America she was given a gala home-coming party by the American Federation of Actors. During the winter of 1934-35 she played at the Hollywood Restaurant in New York, and at many benefit performances. Next she appeared at the Hollywood Trocadero, making a new bid for motion pictures but without success. In 1936 she returned to London in time to witness the strained weeks leading up to the abdication of King Edward VIII (Duke of Windsor '44). Miss Tucker was acquainted with the former Prince of Wales and was deeply touched by the entire affair.

In 1937 Miss Tucker was in Hollywood, trying the films again, under contract to Metro-Goldwyn-Mayer. Anxious for success in the new medium, she took acting lessons from Laura Hope Crews. In *Broadway Melody* Miss Tucker played with Eleanor Powell, Robert Taylor, and Judy Garland '41. Then in *Thoroughbreds Don't Cry* she played a straight character part without singing. But she was dissatisfied with her career in motion pictures

TUCKER, SOPHIE—*Continued*

and left Hollywood. She does not recommend the pictures she has made, declaring: "That is not Tucker you see on the screen." From Hollywood she went back to night-club work, appearing in 1938 at Ben Marden's Riviera in New Jersey. In that same year she was elected president of the American Federation of Actors, the first woman to hold that office.

In November 1938 she opened in the musical comedy *Leave It To Me*, which was a success on Broadway and later on tour. While performing in this show she did cafe and radio work, also participating actively in the affairs of the A.F.A. Her next show, in 1941, was George Jessel's *High Kickers*. It received bad critical notices much to Miss Tucker's indignation. In March 1944 "The Durable Tucker" opened as star of a brilliant revue at New York's Copacabana. Discussing the show, the New York *Sun* stated: "Sophie Tucker isn't cooling off any, and for that matter neither is her doting audience. . . .Miss Tucker, magnificently turned out, gives utterance to hardy aphorisms and characteristic laments with all of her raucous sincerity, and her audience loves it." In April 1944 *PM* paid tribute to Miss Tucker for canceling a Boston night-club engagement to entertain wounded servicemen at Halloran General Hospital in New York. The singer is as popular with servicemen in the Second World War as she was in the First.

The sixty-one-year-old trouper was given a write-up in *Variety* in October 1945, a report of her engagement at the Mayfair in Boston: "Headlining at $3,500-a-week salary, an accepted invitation to speak at the Boston Book Fair, and sell-out dinner tables every night, Sophie Tucker is doing very well by herself. Time has not changed nor custom withered the marvelous trouper's 'Honey Boy', 'Some of These Days,' and 'How You Gonna Keep 'Em Down on the Farm?' which have the same wow reaction as when Soph was here three years ago. . . .She still has the spirit of youth, and now and then carries out the promise of a hit song, 'Red Hot Mama Is a Jitterbug Now.'" *Variety* added that only Miss Tucker could put the rowdy "Tax on Love" across under Boston censorship—and that she did it with a "cosmic bang." On the occasion of her engagement at the Martinique, New York newspaper reviews were equally enthusiastic.

For a number of years Miss Tucker had been writing down her own account of her long life in show business. In March 1945 the finished book, *Some of These Days*, was published. The autobiography, as one might expect, was full of anecdotes of Miss Tucker's famous friends in the entertainment world, as well as being a lively, hearty tale of struggle and success, with no mistake about the success. Stanley Walker '44 described it as one of the "pleasantest, most ingratiating and unpretentious autobiographies ever turned out by anybody in show business." The *Library Journal* called it "frank and racy," written "entertainingly and with engaging honesty." Dissenting opinion was voiced by Bernard Sobel, who wrote in the *Saturday Review of Literature*: "As an autobiographer Sophie Tucker is—to use her own idiom—a 'flop.' But as an entertainer she is still 'tops' . . . international goddess of off-color laughter and song." But *Variety*, the "showbiz" paper, called the book "real, earthy, honest. Soph takes pride in herself, her work, and her profession. . . .Her cavalcade of names reads like a who's who out of *Burke's Peerage* and the Ellis Island steerage, with a very imposing array of Equity, NVA, Hollywood, and Côte d'Azur names in between." Jo Ranson in the New York *Times* said pungently, "This is a sharp, honest, and frequently uncorseted tale. . . . Sophie herself has gone right on, singing the 'hot numbers' which, she explains, are all very moral because 'they have to do with sex, but not with vice.'" "She does not gloss over or apologize for anything, not even her love life, which she admits 'set her back a million,'" the *Book-of-the-Month Club News* commented. And when Miss Tucker arrived in New York in July 1945 after a run at the Chez Paree in Chicago, *Variety* reported she "sliced a $34,200 melon to theatrical and other charities gained through sales of fifteen hundred of the twenty-five-dollar de luxe editions of her autobiog. Beneficiaries on an even split are Actors Fund, Catholic, Episcopal, and Jewish Theatrical Guilds, Home for the Aged, Hartford, Connecticut, and the Sophie Tucker Playground Camp Fund."

The fair-haired, blue-eyed entertainer is "big in voice, heart and beam." Disarmingly frank about her appearance, Miss Tucker has capitalized on her unglamorous aspects in song. When performing she has always been elaborately gowned and gorgeously bejeweled. Past sixty, the personable performer is still an audience favorite and still "good old Sophie" to the admiring members of her profession. Called by one critic "an institution" in the entertainment world, Miss Tucker has a formula for success in show business: "Above all, the performer must look ahead. You can't grow stale or cling to a period. You must belong to your time." She firmly believes in organization in the theatrical profession; her experiences in unionism form an interesting part of her autobiography. She states: "I am convinced that the actor needs his union. But he needs to be an active, vigorous part of it." High-spirited, philanthropic Miss Tucker is proud of her profession and its great tradition. "Show business has been my life. I wouldn't have had any other. It is the life I always wanted."

Tucker, S. Some of These Days (1945)

TUDOR, ANTONY Apr. 4, 1909- Choregrapher; dancer

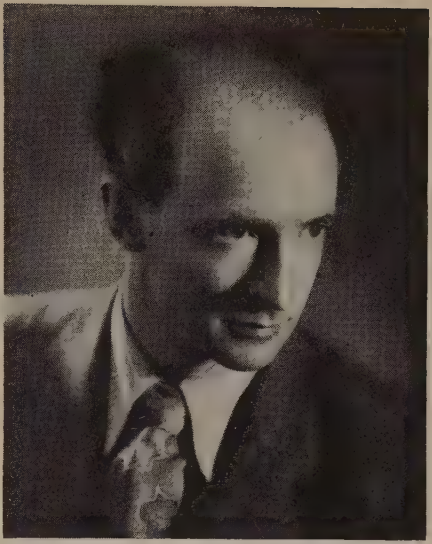
Address: b. c/o Ballet Theatre, 25 W. 45th St., New York City; h. 52 W. 52d St., New York City

Antony Tudor, as dancer and "one of the most significant choregraphers of this century," has been a leading member of the Ballet Theatre in America since 1938. Previously his career in the ballet comprised eight years as dancer and choregrapher in his native England; and he has won distinction in the United States for his creation of works ranging from tragedy to satire.

Born in London on April 4, 1909, Antony Tudor (the dancer's professional name) was brought up in the British capital, where his family was in business. The young man began his career as a clerk, but a few visits to the ballet determined his future—for in 1928 he saw Anna Pavlova dance, and he attended the ballets presented by Serge Diaghilev. "These experiences changed the whole course of his life," writes Cyril W. Beaumont in the *Complete Book of Ballets.* Tudor became deeply interested in the dance, ambitious to become the director of a ballet company. He therefore decided to study the technique of the classical ballet and subsequently studied with Mme. Marie Rambert, Pearl Argyle, and Harold Turner.

Meanwhile he continued to earn his living in business, and in 1930 he joined a firm of real estate assessors. The position, however, required traveling and thus interfered with his ballet studies. For this reason, when Mme. Rambert founded the Ballet Club later that year and offered him a two-year contract as secretary and dancer, Tudor accepted. The young dancer soon tried his talents at choregraphy, going to Shakespeare's *Twelfth Night* for the theme of his first ballet, *Cross-gartered.* Produced in 1931, this work won praise from Massine '40. It is reported that Tudor had very little money during this period; when part of his research for his first work involved a trip to its original setting in Italy, his father supplied the funds as a gift for his twenty-first birthday.

In 1932 Tudor's contract was renewed for another year and when, in September 1933, he joined the Vic-Wells Ballet, he maintained his connection with the Ballet Club. During two years with Vic-Wells he danced many roles, including Eusebius in *Le Carnaval,* the Man in *La Création du monde*, and the Man in *Hommage aux belles Viennoises.* Tudor also arranged the ballets in the operas *Carmen* and *Faust,* while continuing to produce his own works at the Ballet Club. In 1932 he composed the ballet *Lysistrata* or *The Strike of Wives,* with music by Prokofiev '41, and that year also saw the production of *Adam and Eve* (Lambert) for the Camargo Society. The next year brought *Atlanta of the East* (Seelig), which, with Tudor's first two works, was pronounced by A. L. Haskell (*Balletomania,* 1934) "the most interesting yet produced by an Englishman." In 1934 *The Planets* (Holst) was presented, and Tudor also produced *Castor and Pollux* for the Oxford University Opera Club. In 1935 came *The Descent of Hebe* (Bloch) and during the opera season at Covent Garden the choregrapher arranged the dances for *Schwanda, La Cenerentola, Carmen,* and *Koanga.* His next ballet, in 1936, *Lilac Garden* (Chausson), with "a Maupassant-like plot," was later to become an American favorite. *Dark Elegies* (Mahler), too, first presented at the Duchess Theatre in 1937, was destined for American popularity. In 1937 Tudor also produced *Gallant Assembly* (Tartini) at the Playhouse at Oxford. In each of his ballets the choregrapher danced a principal role. During those years of his London career Tudor arranged the dances for musicals and once coached movie actress Vivien Leigh for a dancing part in *The Happy Hypocrite.*



Shelburne Studios

ANTONY TUDOR

When the Ballet Theatre invited Antony Tudor to come to America in 1938, the Englishman brought with him his most popular works, which rapidly won approval and became part of the company's active repertoire. Critics of the dance generally acknowledge Tudor as one of the most original choregraphers in the contemporary ballet. His work is judged part of the modern idiom, like the ballets of Agnes de Mille '43 and Jerome Robbins, which have revitalized the dance. Mark Schubart has said that of all choregraphers Tudor "manages best to utilize the modern idiom in a way that people understand; to have new ideas and get them across to his audience." Another critic, noting the Tudor traits of simplicity and understatement, has commented that his ballets have "a dreamlike, nostalgic, heavily perfumed quality." Edwin Denby, in his article "Tudor and Pantomime" (New York *Herald Tribune,* July 11, 1943), remarked that "Tudor succeeds as a storyteller, using ballet images." In *Dance* (June 1945), Dorothy Barret in discussing the choregrapher's scholarly treatment of themes declared, "There is more than meets the eye in Tudor's ballets."

Lilac Garden, presented during the 1940 season, won the praise of New York *Times* critic John Martin, who commented that the sentimental, poignant drama made good use of the academic tradition. Four years later the *Sun*'s Arthur V. Berger called this ballet "a work which is among the best contemporary ballets." At New York's Lewisohn Stadium in August 1940 the Ballet Theatre presented Tudor's "lighthearted little ballet," *Goya Pastoral,* set to the music of Granados' *Goyescas.* February 1941 saw the American première of *Gala Performance,* a spirited burlesque of ballet in "the most Russian-Russian manner," which became an immediate box-office success.

TUDOR, ANTONY—*Continued*

After a performance in April 1943 Burton Rascoe called this satire "a delight."

With the première of *Pillar of Fire* in April 1942, another facet of Tudor's creative ability was revealed, a talent for psychological probing. Set to Arnold Schoenberg's '42 *Verklaerte Nacht*, this dramatic study of a young girl's frustration elicited praiseful superlatives. Martin found it "magnificent," while a performance two years later prompted Berger to place it among the "most solid and inspired" works in the repertoire. When *Dim Lustre* was first performed at the Metropolitan Opera House in October 1943, Louis Biancolli wrote in his review that "nostalgia and fine-shaded nuance are still Mr. Tudor's forte, and smooth, interweaving patterns his secret." Called another "psychological episode," this ballet, danced to the Richard Strauss '44 *Burleska*, was welcomed for its charm and spontaneity. However, to a critic reviewing a performance in 1944, it seemed "a shabbier and emptier piece each time it is seen again."

Tudor considers *Dark Elegies* his best work In the ballet, according to a critic in 1942, the choregrapher has created "a visual counterpart of Mahler's affecting *Kindertotenlieder*." After viewing it in April 1944 Edwin Denby remarked that the actual dance detail is "willfully spare, but it is also of a remarkable elegance in its arrangement." In April 1943 Tudor's *Romeo and Juliet* made its debut at the Metropolitan, danced by Hugh Laing and Alicia Markova '43, with a production cost of about twenty thousand dollars. In this work the choregrapher ventured into the major tradition of the narrative ballet, thus, according to one critic, "abandoning the erotic in favor of a tender lyricism." Tudor had first become interested in this theme three years earlier, when listening to Prokofiev's ballet suite. Although this music inspired the idea, Tudor sought another score, trying the *Romeo and Juliet* music of Tchaikovsky, Berlioz, and Gounod before he selected various suites of Delius arranged by Antal Dorati. The ballet's libretto follows closely the Shakespearean text, but moves about four times faster than the play. Called "a wonderful stage piece" and "a consistently poetic medieval story," the ballet was given a reception summed up by *PM*'s headline as "Romeo and Juliet in Dance Is Shakespeare As You Like It." Tudor, who danced the part of Tybalt, was, in the opinion of one writer, "an epic and malevolent Tybalt."

Besides dancing in his own works, Tudor also appears in other productions. His dancing in Massine's *Aleko* was called "first rate" by Harriett Johnson, while Margaret Lloyd considered him "a very fine dancer." The latter especially singled out for commendation his interpretation of the Dummy in *The Great American Goof*, the Lover in *Lilac Garden*, the Mourner in *Dark Elegies*, and his jitterbug *pas de deux* in *The Raymond Scott Quintet*.

While Tudor did not dance in his 1945 offering, *Undertow*, it was agreed that he did dominate the stage through his story. First presented in April, *Undertow* excited much controversy, although the critics felt that the work displayed strength and brilliance. The story, based on an idea of John van Druten's '44 and danced to music especially composed by William Schuman '42, depicts childbirth, murder, depravity, and corruption, unusual materials for the ballet. To John Martin it appeared as "a kind of Greek tragedy in terms of the London slums," and he praised Tudor's courage in having created and produced it. The ballet's theme drew columns of discussion: *Newsweek* predicted that the graphic treatment would "shock and repel many people"; Harriett Johnson in the New York *Post* regretted that it presented "an ignoble side of life"; while Margaret Lloyd in the *Christian Science Monitor* reminded those who found the subject matter revolting to consider the actual world scene as reported in their newspapers. Combining the real and the symbolic, *Undertow* was called "complex and confused" but at the same time a challenging, absorbing ballet. In an otherwise favorable review, Robert A. Hague noted "a feeling of unfulfillment at the end which is not aesthetically satisfying." Margaret Lloyd found it especially significant that two of America's greatest choregraphers, Antony Tudor and Martha Graham '44, "must go to the grim depths of psychological torment for their material. Their technical methods are different, but it is 'out of the hurt heart' of humanity that they compose."

Some critics remarked on the absence of program notes for *Undertow*, which reduced understanding of the work to a completely personal basis. "To everyone in the audience it meant something quite different, which I think is good," Tudor has remarked. The choregrapher does not like to use long synopses of ballet plots, but prefers that suggestive character titles and the action of the dance tell the story. (His works are thought to require as much acting as dancing.) "If audiences are to gain the fullest enjoyment," says Tudor, "they must be trained as well as the dancers to do some of the work." Hugh Laing, who has danced the parts of many of Tudor's heroes, believes that the choregrapher translates life movements into dance movements, blending all elements—music, setting, costumes, lights—"into a perfect whole."

In 1943 Tudor was honored by the Ballet Theatre with an all-Tudor program and then presented with gifts by the entire company and by impresario S. Hurok '41—"the first time in modern ballet history that an artist has been publicly so honored by his associates." Another "evening of Tudor" at the Metropolitan in 1945 brought praiseful notices. That year Tudor turned to musical comedy again, creating the ballet *Success Story* for the ill-fated show *Hollywood Pinafore*. Using only four dancers, this "dramatic and inspiring little masterpiece stopped the show every night." Tudor staged the ballets for John C. Wilson's production *The Day Before Spring* which opened in New Haven on October 25 and in New York four weeks later. Burton Rascoe of the New York *World-Telegram* spoke of the "superb ballets portraying dream fantasies," while Lewis Nichols in the New York *Times* thought that, although the informal dances were "unpretentious and easy," the two ballets lacked the light touch. As a regular member of the Ballet Theatre company Tudor appeared with the group in performances on the West Coast in the summer of 1945 and that fall was dancing with them in New York.

Antony Tudor is described as a charming and unassuming person, serious and quiet-spoken. Each year the choregrapher appears less frequently as a dancer. He plans eventually to stop dancing in order to devote himself entirely to creative work—"My best performances are in the rehearsal studio."

Beaumont, C. W. Complete Book of Ballets (1941)

TYDINGS, MILLARD E(VELYN) (tī′ dĭngz) Apr. 6, 1890- United States Senator from Maryland

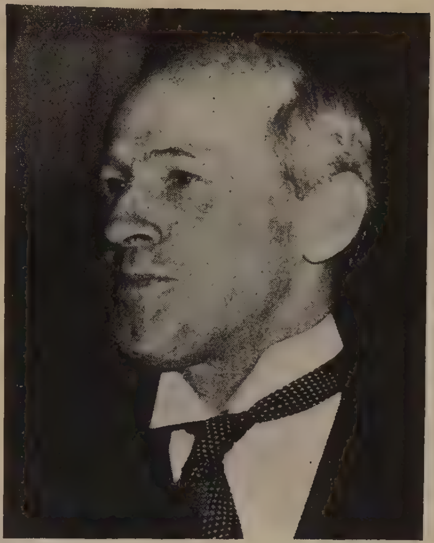
Address: b. Senate Office Bldg., Washington, D.C.; h. Havre de Grace, Md.

One of the most prominent anti-New Deal Southern Democrats in the United States Senate is urbane Millard E. Tydings, who in 1944 was re-elected to his legislative post for a fourth consecutive term—and with 29,000 more votes from Maryland than President Roosevelt '42 himself received in that state. An eminently successful lawyer, he is the senior partner of the Baltimore firm of Tydings, Sauerwein, Levy and Archer.

Born in Havre de Grace, Maryland, on April 6, 1890, Millard Evelyn Tydings is the son of Mary B. (O'Neill) Tydings and Millard F. Tydings, a government clerk. The future Senator received his B.S. in mechanical engineering from the Maryland Agricultural College in 1910 and then he went on to the University of Maryland, which gave him his LL.B. three years later. Admitted to the Maryland bar the same year, he began his law practice in Havre de Grace; and in 1916 became a member of the Maryland House of Delegates, serving for a two-year term. Neither law nor politics claimed most of his attention during those two years, however, for in 1916 he served as a private on the Mexican border, and when the United States entered the First World War a year later he was an officer with the AEF, advancing to the rank of lieutenant colonel in the Twenty-ninth Division, Machine Gun Units. He participated in the Haute Alsace, and Meuse-Argonne offensives, and when he returned to the United States it was with a D.S.M., a D.S.C., and three citations. The Senator is a member of the American Legion and the Veterans of Foreign Wars.

Tydings resumed his public life after the war. From 1920 to 1922 he served as speaker of the Maryland House of Delegates, and was then elected to the Maryland State Senate. In 1923 he went to the United States House of Representative from the Second Maryland District, and in 1927 he was sent to the Senate. Since that time no opponent has succeeded in displacing him.

In the early days of the New Deal, Tydings voted against unemployment relief, farm relief, low-cost housing. He may have been a candidate for Roosevelt's attempted "purge" of 1938, but was nevertheless returned to the Senate in that year. In the foreign policy field Tydings opposed the Administration as often as not. In August 1940 he voted for Selective Service, but in December he suggested that the United States ask Great Britain and the Axis for a statement of conditions under which each would agree to end the European war, so that the United States could determine if there was any basis for the negotiation of a "just peace." (According to Joseph Alsop and Robert Kintner, this proposal followed a talk with Ambassador Kennedy '40.) In 1941 the Senator voted against the extension of the draft law and, a month before Pearl Harbor, against relaxation of the neutrality law to permit American ships to carry munitions to Great Britain and Russia. In 1943 he proposed that Great Britain transfer its island possessions in the Western Hemisphere to the United States, protesting that the American people were naïve and overgenerous in regard to Lend-Lease.



MILLARD E. TYDINGS

A member of the Senate Appropriations Committee, Tydings has always been particularly concerned about Federal expenditures, and in February 1942 he became head of a special subcommittee of the Appropriations Committee authorized to promote economy and efficiency in the Government. Equally concerned about Government deficits, as early as November 1940 he called for a broadening of the income tax base on the theory that those with small incomes must help to pay the deficit. Late in 1942 he introduced a proposal for a constitutional amendment providing that in peacetime Congress could not appropriate funds by less than a three-fifths majority of each house, unless at the same time it levied taxes sufficient to cover the appropriation. Other phases of the domestic front during the war—strikes in war plants, Government participation in business, unemployment relief, the National Youth Administration, price rollback subsidies—were targets of his attacks in the Senate.

In March 1944, announcing his candidacy for renomination to the Senate, Tydings said he would "work for government by law, and, in

TYDINGS, MILLARD E.—*Continued*

accordance with true Democratic principles, against the establishment of government by bureaus." At about the same time Harry H. Woodring, organizing anti-New Deal forces for a convention fight against a fourth term for Roosevelt, listed Tydings as among the Democrats who he believed would be available for a third party Presidential nomination; but in the spring of 1944 Tydings was reportedly receiving National Democratic Committee aid in his fight for re-election. It was not a difficult fight. Running against four opponents, in May he was renominated by better than 3 to 1 in the Maryland primaries, and in November Roosevelt himself ran behind him on the Democratic ticket. The Senator uses radio transcriptions to keep himself before his constitutents. The 1944 vote was 344,725 to 213,705.

One of Tydings' first record votes of 1944 had been against Federal handling of ballots for servicemen in the forthcoming elections; but later, in February, he cast his vote for the Federal-ballot amendment to the "States' rights" bill. Another was for freezing the Social Security tax at 1 per cent, and a third was to require labor unions, farm cooperatives, and other nonprofit organizations to file yearly financial reports. He was against any further payment of subsidies to keep down food prices; for the "ripper amendment" to bring the TVA under the immediate control of Congress; against closure in the antipoll tax bill filibuster; for the George ['43] Reconversion bill, as against an Administration-backed measure; but against the Bankhead ['43] amendment to raise cotton textile price ceilings. In 1945 he voted for the confirmation of Henry Wallace ['40] as Secretary of Commerce after the RFC lending agencies had been removed from his control. Tydings favored a limited national service bill for deferred men of draft age (backed by the Administration but opposed by industry and unions); he called Congress cowardly for preferring the compromise Kilgore ['43]-O'Mahoney ['45] bill, voted against it and for the Ball ['43] amendment, which imposed penalties on employers violating War Manpower Commission orders, and he introduced an amendment to fine deferred agricultural workers who left their farm jobs.

Senator Tydings voted against confirming former NYA head Aubrey Williams ['40] as Rural Electrification Administrator. He was paired for ending Lend-Lease automatically with the end of hostilities, saying, "I do not want to sign any blank checks for the postwar era"; he was for the "high level" employment bill, as amended, and voted to have Federal control of the Employment Service extended. His foreign policy vote record for 1945 included a vote for confirming the Mexican Water Treaty, a pair for extending the Reciprocal Trade Agreements Law without lessening the President's tariff-reducing powers, and a pair for entering the world bank and world fund agreed upon at Bretton Woods. He sought unsuccessfully to get President Truman ['45] unqualified Congressional authorization to reorganize all the Executive agencies and departments. In September 1945 the *Christian Science Monitor* classed Millard Tydings with George of Georgia and Byrd ['42] of Virginia as leaders of the conservative Southern wing of the Democratic Party.

Tydings, in turn, has been the target for attack by New Dealers. In 1939 Drew Pearson ['41] and Robert Allen ['41] charged that he had called upon the WPA to construct a road and yacht basin on the Tydings estate in Maryland. Actually the improvements had not been made on Tydings' property; a road had been built up to the estate and a yacht harbor constructed adjacent to it. Attorney General Robert H. Jackson's ['40] refusal to prosecute Pearson and Allen for libel caused Tydings to vote against confirming Jackson's nomination as Associate Justice of the Supreme Court in June 1941. The Tydings-Miller amendment to the Antitrust Act, an amendment which went into effect in 1939 and permitted price-fixing by manufacturers, was criticized by the Federal Trade Commission as "economically unsound and undesirable in a competitive economy . . . a cloak for many conspiracies in restraint of trade . . . inconsistent with the purposes of the antitrust laws."

As chairman of the Senate Committee on Territories and Insular Affairs, Senator Tydings has more than once found himself working side by side with New Dealers. He is joint sponsor of the 1934 Tydings-McDuffie Act by which the Philippines were promised their independence in 1946, and in September 1943 he presented a resolution to give independence to the Philippines then rather than in 1946. Shortly afterward Roosevelt called on Congress to give him authority to grant independence to the Philippines before 1946, and Tydings' resolution was revised to grant power to the President to proclaim Philippine independence when he considered the moment propitious. The Tydings-McDuffie Act was the result of Roosevelt's request that the Filipino-rejected Hare-Hawes-Cutting Act of 1932 be revived and amended. The amended Act contained one change looking toward the removal of United States military establishments from the Philippines after a ten-year period. The Philippine Government accepted the new terms on May 1, 1934, the thirty-sixth anniversary of Dewey's victory in Manila Bay, although the Act still contained the tariff provisions which had been found objectionable.

In 1945 Tydings became chairman of the Philippine Rehabilitation Commission, composed of Congressmen and Philippine representatives, and in early June he returned from a Presidential mission to the islands to report on the "indescribable" situation there. His recommendations, presuming the grant of independence on the scheduled date of July 4, 1946, included: the gift of one hundred million dollars, administered by American Army Engineers, toward reconstruction and rehabilitation of the devastated islands; liberal loans to tide the new republic over the acutely difficult postwar years; continued low tariffs on Philippine products for the next few years, followed by a gradual increase to normal tariff levels. Many persons held that at least twenty years inside the American tariff walls would be needed by the Filipinos, but Tydings reminded critics that political independence necessarily meant the eventual loss of protection. Later, urging passage of a bill to turn over immediately some seventy-one million dollars which were being held in trust for the Philippines until independence, he told the Senate it would probably obviate the need for a loan. In response to a request from President Truman, Tydings introduced legislation to authorize a prompt general election in the islands. Other problems of the Committee on Territories and Insular Affairs concerned Puerto Rico, and the Senator from Maryland announced that a bill was being drafted to let Puerto Ricans choose between independence and greater local self-government under the American flag. It was, he thought, doubtful that Congress would authorize either statehood or dominion status for the Spanish-speaking tropical island.

As of 1945, Tydings was not only chairman of the Senate Committee on Territories and Insular Affairs, but was assigned to five other committees, where the real work of shaping legislation is done. He had a place on the Appropriations Committee, was ranking member of the Naval Affairs Committee; and he served also on three of lesser importance, District of Columbia, Public Buildings and Grounds, and the Committee to Audit and Control the Contingent Expenses of the Senate. In October 1945 he was one of the ten Senators who were appointed to the Special Committee on Atomic Energy, of which Brien McMahon '45 was chairman. One of the three Naval Affairs members on that committee, he, with other members, took a course in nuclear physics at the Bureau of Standards before making investigations and hearing testimony on atomic research. Observers commented on the quiet tension and lack of partisan feeling at the committee meetings, which were described as unique in the annals of Congress. "It is up to the United States," Tydings said, "to find ways of creating friendships between nations to prevent a push-botton war that will be over before most people will know it began."

Long one of Washington's most eligible bachelors, he was married in 1935 to Eleanor Davies Cheseborough, daughter of Joseph E. Davies '42 and stepdaughter of Marjorie Post Close Hutton Davies, General Foods heiress. Senator and Mrs. Tydings have two children, Joseph Davies and Eleanor. The Tydings are among the Capital's most notable "diner-outers," and their country estate at Aberdeen, Maryland, makes Tydings the "squire of Harford County." A tall, lean, muscular man, his favorite recreations are athletic—golf, fishing, and boating—but he is also an accomplished pianist. He is the author of *The Machine Gunners*; *Before and After Prohibition* (1930), an argument against national prohibition, and of *Counter-Attack, a Battle Plan To Defeat the Depression* (1933). The "four horsemen" of the depression were seen as tariff and embargo, depreciated currency, war debt, and armaments. Tydings urged wholehearted cooperation with other nations to defeat depression through renewal of the trade of the world, final settlement of war debts, stabilization of national currencies, and disarmament to a peacetime basis. Of the book the New York *Times* reviewer said: "It has the value . . . of vivid dramatic presentation."

Tydings is an Episcopalian, a Mason, and an Elk; his clubs include the Havre de Grace Yacht Club, the Maryland Club (Baltimore), the Chevy Chase (Washington), and the Burning Tree. He has received honorary degrees from St. John's College and Washington College.

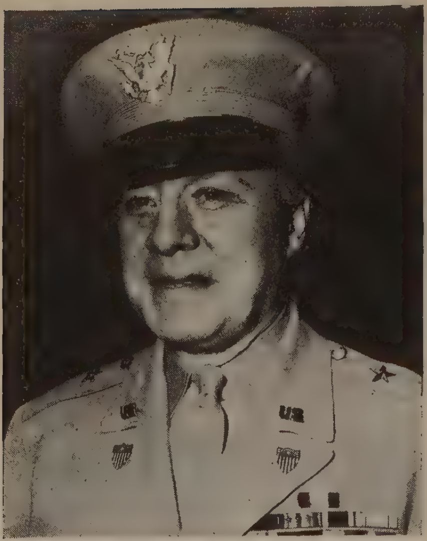
ULIO, JAMES A(LEXANDER) (ū'lĭ-ō) June 29, 1882- Former United States Army officer

Address: b. c/o Food Fair Stores, Inc., Elizabeth, N. J.

"Personnel director" for an army of 8,300,000 men—that was the job of Major General James A. Ulio, the Adjutant General of the United States Army. His responsibilities covered the procurement and disposition of all personnel, from the time men reported to their draft boards for induction until their discharge or death. He was also responsible for the service records of these men, which were vitally important in the adjustment of claims through the Veterans Administration, or as a basis for personal history required by the discharged soldier or his family. Whether it was the date and severity of a wound received in action, or simply the number of typhoid shots received while in service, the Adjutant General's Office could furnish the information. As the officer whose responsibility touched the American public most closely—recording, as he did, the service history of its soldier relatives—the Adjutant General became an unofficial liaison officer between the Army and the civil population, explaining and, when necessary, defending Army policy before the bar of public opinion.

Despite his Latin-sounding name, Ulio is the son of an Irish immigrant who was born in Belfast, became an Army man in the United States, and rose to the rank of major. The son, James Alexander Ulio, was born in Walla Walla, Washington, on June 29, 1882. He, too, chose a military career, enlisting in the Regular Army in September 1900, a few months after his eighteenth birthday. While an enlisted man he served as private, corporal, and battalion sergeant major; then, in October 1904 he won a commission as a second lieutenant in the Infantry.

Before the First World War Ulio's assignments were divided between service in the States and in the Territories. His first duties as an officer were with the First Infantry, with which he served at Fort Brady, Michigan, from November 1904 until January 1906. He was then ordered to the Philippine Islands and later back to Vancouver Barracks, Washington, in May 1908. He was promoted to first lieutenant while at the latter station, in March 1911, and went to Hawaii in May of the following year, serving with the First Infantry until August 1916. (He had been raised to the rank of captain in July.) He next joined the Thirty-



U.S. Army Signal Corps

MAJ. GEN. JAMES A. ULIO

second Infantry stationed at Schofield Barracks, also in the Islands, but before the year ended America had entered the First World War, and Ulio returned to the States. He was assigned to the Twenty-third Infantry at El Paso, Texas, in May 1917, and the same month he accompanied the regiment to Syracuse, New York. In August he received a promotion to major (temporary) and was transferred to Camp McClellan, Alabama, to take up the post of adjutant of the Twenty-ninth "Blue and Gray" Division.

Ulio is said to have revealed marked ability as adjutant. He was sent to France in March 1918, and after attending the Army General Staff College for two months was made assistant chief of staff for personnel, with the Thirty-fifth Division. In June he was given a similar post with the Fourth Corps, with which he remained until November. (In September he had been made lieutenant colonel, temporary.) While with the corps Ulio received the Distinguished Service Medal for showing "marked organizing and administrative ability. By his tireless efforts and ceaseless energy he contributed in a large degree to the success achieved by the Fourth Corps in the Toul sector and in the battles of the Saint-Mihiel salient. Later he handled with great success the evacuation and feeding of French civilians in the occupied territory recovered from the enemy, rendering invaluable service to the American Expeditionary Forces." He was also made a Chevalier of the French Legion of Honor.

From the end of 1918 until the following August Colonel Ulio was chief of the statistical division and in charge of the Central Records Office at General Pershing's AEF Headquarters. At this time, because of his efficiency in caring for civilians in war-stricken areas, and because of his administrative skill, he was chosen as assistant chief of staff for William Haskell's relief mission to Armenia, a position he held until May 1920. For the next three years Ulio served in the Adjutant General's Office in Washington. At the end of this time he was again selected for the job of aiding a distressed nation, when in January 1923 he was sent to Greece for several months as chief of the Administrative Division of the American Red Cross. For his services, Ulio was made a Knight of the Greek Order of the Redeemer and a Commander of the Montenegrin Order of Prince Danilo. He has also received the Serbian Order of the White Eagle, with Swords, third class, and the Panamanian medal of La Solidaridad, second class.

The following years contributed their share to Ulio's training for his present post. After returning from Greece he served until June 1926 as assistant to the adjutant general at the headquarters of the Second Corps Area, Governors Island, New York. He then returned to Washington to serve for three more years in the Adjutant General's Office. In November 1928 he was raised to the permanent rank of lieutenant colonel. Two years later, after his graduation from the Command and General Staff School at Fort Leavenworth, Kansas, he resumed his duties in Washington, also serving for a time as an aide to President Herbert Hoover '43 at the White House. He next attended and in June 1934 was graduated from the Army War College in Washington, and then functioned as executive officer in the Adjutant General's Office until February 1935.

In March 1935 General Ulio went to Hawaii for his second military assignment there, this time as aide to Major General Hugh A. Drum '41, commanding general of the Hawaiian Department. In June Ulio became chief of the Service Command Section at the headquarters of the Department (in August he was made colonel), remaining in that post until September 1936, when he assumed the post of chief of staff. In November 1937 he returned to the United States, where from March to May, 1938, he served as assistant adjutant general of the Second Corps Area. He was then ordered to Washington as executive officer in the Adjutant General's Office, a post he held until December 1939, when he was appointed, for a term of four years, as Assistant Adjutant General of the Army, with the rank of brigadier general.

The Assistant Adjutant General assumed no easy task. His major job was maintenance of the Army's morale, and he was confronted by political ramifications growing out of the extension of draft and National Guard service, by the soldiers' disgust with extemporized equipment, by the ineffective leadership of certain "stuffed-shirt" officers, and by the boredom of first-class fighting men without a fight. Fully aware of the conditions, General Ulio analyzed the causes and gave this definition of what morale is: "It is when a soldier thinks his army is the best in the world, his regiment the best in the army, his company the best in the regiment . . . and that he himself is the best damn soldier-man in the outfit." In early 1941 this quality was conspicuously lacking in a large part of the United States Army. Said one old sergeant: "Give us a shooting war and there won't be a morale problem." In December 1941, he got his wish.

Three months after the attack on Pearl Harbor Ulio was promoted to the rank of major general and raised to the post of the Adjutant General of the Army. His task was tremendous. The Army mushroomed from nearly two million to over eight million. Each man required a separate and distinct record. He was classified, reclassified, assigned, paid, promoted, transferred, retired, or discharged. The Chief of Staff, General George C. Marshall '40, had adopted a replacement system by means of which battle losses were to be made up by sending trained replacements into the depleted units, rather than withdrawing the entire unit for regrouping, as was customary. He also believed in a generous policy of awarding decorations for courage and ability, and it was up to Ulio to work out the details. Leaves and furloughs had to be handled, too. The incompetent were to be weeded out, the unruly punished. Mail and welfare facilities were expanded to serve the need of a rapidly expanding and far-flung army. Guiding these manifold efforts and supervising the many details was the Adjutant General, James A. Ulio. On the home front, it was Ulio's duty to notify the family of a soldier of his injury or death or capture by the enemy. On the political front he had to explain War Department policy whenever it affected votes in Congress or diplomatic relations with the Allies.

Before the Presidential election of 1944, in answer to a charge that politicians were plotting to deprive the servicemen of their vote, Ulio published a statement through the various service commands to the effect that all induction centers specifically provided that no draftee should be deprived of his vote by reason of induction. There was also a political hullabaloo over the appointment of Communists as commissioned officers. Ulio clarified the change of Army policy, stating, "Restrictions on soldier Communists were relaxed in justice to the individual and fairness to the Government." The receipt of commissions was based on individual attitudes and actions. Congressmen questioned the matter and appointed an investigating committee. These situations were complicated by the possibility of offending an ally, the Soviet Union. Upon the victorious culmination of the war in Europe an outcry immediately arose, demanding quick furloughs and discharges for soldiers who had been away from their homes and families a long time. To meet this problem of national morale, General Ulio forecast a reduction in the strength of the Army to 6,968,000 men within a year. He disclosed that 40,000 to 50,000 front-line soldiers were being sent home each month, and indicated that the number of furloughs would be increased during the months ahead. Liberated prisoners and movable wounded were given top priority, while soldiers who had not as yet seen foreign service were slated for such assignment before discharge.

Ulio, who had been on terminal leave from the War Department after September 21, 1945, was elected vice-president of Food Fair Stores, Inc., in October. In his civilian post, one of his duties will be the direction of re-employment and retraining of the more than one thousand employees who had served in the armed forces. The General's retirement becomes effective in January 1946.

General Ulio has been described as a pleasant-faced, white-haired soldier. It is said that his Latin name and appearance have caused strangers to think him an Italian. Delos Lovelace reports that old acquaintances remember him as the best piano player in his regiment. "The General does not lean too heavily on entertainment, or athletics either, for building up morale, however," the writer continues. "Make a man believe his army is the best in the world," Ulio says, "and his own outfit is the best in the whole army and you won't have to worry about shows or ball games."

Who's Who in America, 1944-45

ULLMAN, JAMES R(AMSEY) Nov. 24, 1907- Author

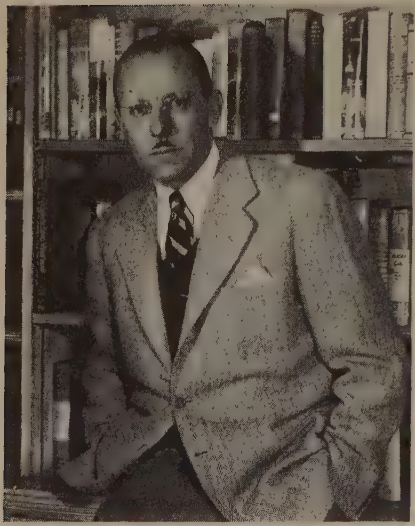
Address: 109 W. 11th St., New York City

Playwright, essayist, and short story writer, James R. Ullman produced his first novel with *The White Tower* (1945). This story of a hazardous ascent is the outcome of twin interests—his long-time avocation of mountain climbing and his profession of writing.

A native New Yorker, James Ramsey Ullman was born on November 24, 1907. His parents, Alexander F. and Eunice (Ramsey) Ullman, in comfortable financial circumstances, sent him to the Ethical Culture School in New York and to Phillips Academy in Andover, Massachusetts. He received his B.A. from Princeton University in 1929, and his prize-winning senior essay, "Mad Shelley," was published in book form the year after his graduation. Although the author was criticized for being "too much in love with his subject," it was also considered that this first literary attempt was "an able and thoughtful essay."

From Princeton Ullman went to work on a Brooklyn (New York) newspaper as a reporter and feature writer. He tried playwriting also, turning out, among other things, *Is Nothing Sacred?*. (Two of these plays were produced.) In 1933 he left the newspaper and began his short but eventful career as a theatrical producer. His first Broadway production, *Faraway Horses*, opened the same day the banks closed; two days later the play followed suit. The next year he scored a huge success with Sidney Kingsley's '43 *Men in White*, the Pulitzer Prize play for 1933-34, which his new firm, Harmon and Ullman, coproduced with the Group Theatre. Lesser hits that followed were the drama *Blind Alley* and the comedy *The Milky Way*. His ten productions also included failures, the year 1936 having a record of four of these in succession. Shortly after the appearance of such press notices as "*So Proudly We Hail* doesn't amount to a hoot in Joe Leblang's bargain basement," and "*The Laughing Woman* has the dramatic content of a hole in a doughnut," this bit of news appeared in Winchell's '43 column: "James R. Ullman, the theatrical producer, is leaving for the Amazon Jungles next week."

The Other Side of the Mountain, which was published in 1938, was the diary Ullman kept during his trip to the Amazon region. It concerned his ten-day journey across the Andes and down the Amazon River in the company of Herman Lord, a former Iowa mayor, who



Cromhard

JAMES R. ULLMAN

had answered Ullman's advertisement in a Lima paper for a traveling companion. (In the book Ullman quotes some of the adverse citicism of his plays and chides the drama critics of New York for causing his departure for South America.) In general, the criticism of *The Other Side of the Mountain* seemed to agree with the Springfield *Republican*'s comment that it was "an undistinguished work with the distinction of getting close to its subject."

Ullman returned to the United States in 1937 and took a job with the Federal Theater, where, he says, he was so busy solving administrative problems that he never had a chance to produce a play. He worked for the project for two years in New York and California, resigning in 1939, just a few months before Congress dissolved the whole program. From that time on he devoted himself to free-lance writing, and has contributed short stories to the *Saturday Evening Post, Story, Collier's, Esquire,* the *American Mercury*, the *American Magazine*, and other "class", "mass," and "quality" publications; several of his articles on mountain climbing have also been published.

In September 1939 Ullman began his attempts to enlist in the Army, but he was rejected several times because of near-sightedness. Finally he joined the American Field Service and spent fifteen months in 1942 and 1943 with the British Eighth Army in Africa, from the Battle of El Alamein through the Tunisian campaign. Most of the time he was an officer in charge of the American ambulances with the Seventh Armored "Desert Rat" Division. Subsequently he was given assignments that took him as far afield as Bagdad and Gibraltar. He was awarded the Star of Africa by Great Britain.

The unrecorded periods in Ullman's life were devoted mainly to mountain climbing, which he did for the first time in 1927 while vacationing in Switzerland as a Princeton undergraduate. He has climbed Mt. Olympus in one hundred and ten degrees of heat, Ixtaccihuatl, the Mexican volcáno, through six-foot snow drifts, Popocatapetl, the Jungfrau, the Matterhorn, some of the Andes "foothills" (sixteen and seventeen thousand feet), and the mountains of the Tetons and Canadian Rockies. The most difficult climbing he has ever done is up Breakneck, on the Hudson, opposite West Point. It is also the place where he came closest to death when he suddenly encountered a snake on a high, narrow precipice. On another occasion he was standing on a six-inch footing high on the side of a Wyoming Teton when a large knapsack dropped from above and muffled his head. Ullman has, however, yet to fulfill his ambition to make an expedition to the Himalayas and climb Mt. Everest. He belongs to the inner circle of American mountain climbers —the American Alpine Society, which limits its members to those who can prove that they have climbed certain peaks.

The author's enthusiasm for mountain climbing led him to write *High Conquest* in 1941. In it he deals with mountaineering all over the world, particularly the history of climbing in the Swiss Alps, from the beginning of the development of the sport to the point it had reached in the prewar period. He familiarizes the reader with many facts about famous mountains and mountaineers and traces the growth of competitive climbing among various nationalities. The book was well received by the critics—more for the information it contained than for its literary style. Clifton Fadiman '41 in his *New Yorker* review considered it "among the finest popular histories (at least in English) of its subject" that he was familiar with, and George Barker in the *New Republic* said that the style was "unassuming and just awkward enough in the right places to give the impression that the author climbs mountains better than he manipulates words."

Ullman's *The White Tower,* which was selected by the Book-of-the-Month Club for September 1945, is his first novel. The critics for the most part agreed that, granting the author's unlikely premises concerning his remarkably representative group of characters, everything else in the novel seems real. The mountain, the Weissturm, which these characters climb, is probably a combination of several mountains Ullman has known. Symbolically, it is made by the author the goal in life toward which the world is constantly striving. The reviewers found that Ullman's thorough knowledge of mountain climbing enabled him to make the sections concerning the ascent so vivid that, during these passages of sustained suspense, the reader almost becomes one of the climbers himself. Some of the characters, all symbolic of a world at war, are never realistically developed, reviewers observed, but are allowed to remain as symbols throughout. As part of the plot, all are motivated by different forces, and although no one is sure of what he will accomplish by making the dangerous climb, each feels a compulsion to try it. At the end they have either been frustrated by their inability to reach the top or killed in the attempt—here it was generally felt that Ullman's philosophy becomes indistinct—but the mountain remains the unconquerable protagonist.

In June 1930 the author was married to Ruth Fishman. The couple, divorced in 1945, have two sons, James Ramsey and William. James Ullman is five feet ten inches tall, and has brown hair and eyes and a bronzed complexion. He reports that his method for writing is to proceed slowly and carefully, seldom rewriting anything. His next novel, he says, will be "very flat—geographically."

Who's Who in America, 1944-45

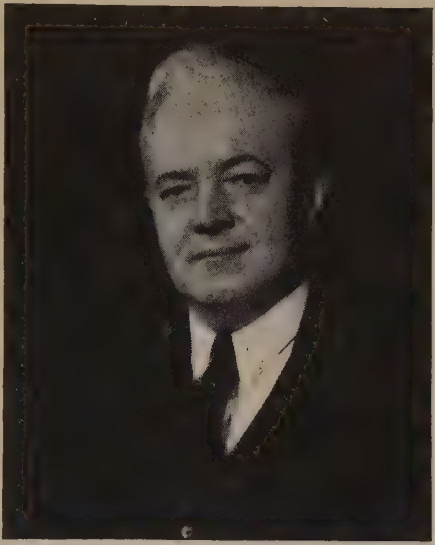
VAIL, ROBERT W(ILLIAM) G(LENROIE) Mar. 26, 1890- Librarian

Address: b. New York Historical Society, 170 Central Park West, New York City; h. 270 Riverside Dr., New York City

"America on Review" might be a fitting title for the collection of Americana housed in the library-museum of the New York Historical Society in New York City, the second oldest society of its kind in the United States. Its collection of historical literature, manuscripts, paintings, folk art, and other objects is considered one of the finest in the world. From such exhibits as Washington's camp cot, to a display of Army and Navy "E" awards, the visitor may conveniently review the history of America. In addition, the Society has probably the best collection of New York and State reference material available. The director of this rich collection, which draws historians from all over the country, is Robert W. G. Vail, former Librarian of New York State.

Robert William Glenroie Vail was born in Victor, New York, on March 26, 1890. His parents were James Gardiner and Mary Elizabeth (Boughton) Vail. After completing his early education, he entered Cornell University on a State scholarship. Although he worked his way through college, he managed to complete the course in three and one-half years, receiving his B.A. degree in 1914. That same year he joined the staff of the New York Public Library as an assistant in the reference department, and, combining study with his work, he obtained his certificate in librarianship in 1916 from the school then conducted by the library. He continued as an assistant until the outbreak of the First World War, when he enlisted in the Student Army Training Corps at Columbia University. Shortly after he volunteered for this service, he was assigned to Fort Totten, New York, as a private in the Coast Artillery Corps. He had been stationed at this post six months when the Armistice was signed. In June he had been married to the former Marie Rogers. They now have two children, Robert William and Mary Elizabeth.

Returning to his former position at the New York library, he continued his studies, taking graduate work in history at Columbia University. Before he was able to complete his course, however, he was offered in 1920 the post of librarian at the Minnesota Historical Society in St. Paul. During the time Vail held this post he was able to continue his studies in historical research, this time at the University of Minnesota. He had been with the Society only a year when he was asked to head the Roosevelt Memorial Association Library in New York City. The idea for such an association had been conceived at the funeral of Theodore Roosevelt by a group of Roosevelt's intimate friends who had felt that an effort should be made to perpetuate the President's memory and ideals. After the organization of the library was begun the Association moved into the restored Roosevelt birthplace on East Twentieth Street in New York.



Blackstone Studios, Inc.
ROBERT W. G. VAIL

In addition to recording and procuring all the writings of Theodore Roosevelt, Vail got in touch with every cartoonist, photographer, author, and publisher in the world who might have produced material about Roosevelt. Two results of this enterprise were the publication of the *Memorial Edition of the Works of Theodore Roosevelt* (1923-26) in twenty-four volumes, for which Vail himself compiled the bibliographies, and the establishment of the first historical film library known to be in existence at the time. The accumulated slides, photographs, and newsreels provided material for over a dozen films revealing various phases of the President's life, and these films have been in continuous demand since their first release. (In this period, too, Vail found time to begin an elaborate bibliography of all Roosevelt's writings, including reprints and translations. Although now complete, publication will be postponed until after the end of the Second World War.) By 1928 the Roosevelt Memorial collection was considered virtually complete. From a nucleus of only twelve volumes the library-museum's collection had attained the valuation of over a half million dollars. However, to make the library more accessible to scholars, it has since been given to Harvard University.

His work for the Roosevelt collection finished, Vail was asked to return to the New York Public Library as general assistant. In this new capacity he selected and purchased rare books, suggested and prepared exhibits, wrote articles for the *Library Bulletin*, and supervised the library publicity. Six months

VAIL, ROBERT W. G.—*Continued*

after his return he was again approached in regard to a new project, this time by members of the Bibliographical Society of America which sought his help in its completion of Sabin's *Dictionary of Books on American History.* This tremendous undertaking had been started in 1867 by Joseph Sabin and was continued until his death in 1881. Three years later Wilberforce Eames took over the task, and spent eight years in gathering data on publication on all phases of American history. Other duties forced Eames to discontinue his research in 1892, and nothing more was done for almost thirty years. The Society, aware that such a project should not be permitted to remain uncompleted, finally raised the necessary funds to proceed with the research. Vail was asked to estimate the approximate research required to complete the compilation of the dictionary. Satisfied with his report that it would take six compilers about seven years, the Society offered him the editorship.

It had been Sabin's original intention to include in his volumes everything concerning the political, governmental, military, economic, social, and religious history from America's discovery to the date of the dictionary's publication. Later, when it was found impossible to follow this plan, the titles were restricted to material published not later than 1876. This date was selected because the *American Catalogue* came into being that year and would record material published after that date. After leaving his post at the New York Public Library, Vail undertook what he considered his greatest achievement. When the twenty-nine volumes were completed seven years later, in 1936, they included references to well over a quarter of a million different publications, in addition to the location of almost a million publications in libraries all over the world.

But Vail was able to give this project his undivided attention for only one year. In 1930 the American Antiquarian Society, in Worcester, Massachusetts—a society devoted to the collection and publication of American history, offered him the post of librarian. It was a tempting offer, for this collection was considered the greatest library of American history in the world, and the librarianship would give him an opportunity to develop many of his ideas. Since the Bibliographical Society did not object to his continuing the research on the dictionary in Massachusetts, Vail, taking some of his staff with him, moved to Worcester to assume his new post.

While at Worcester, Robert Vail was able to encourage students in near-by universities to use the reference material made available by the Society. That was one of his many goals, and he had the satisfaction of observing the results. "One professor from Harvard," Vail has remarked, "would bring his entire history seminar to the library. The plan would be to make an extensive study of one year in America's history, and each student would be assigned a different phase of the year's happenings. Almanacs, newspapers, broadsides, diaries, manuscripts, letters, etc., were examined, with the resultant amazement of the students that so much information might be discovered.

"I was surprised myself," he continued, "to find a wealth of material relating to the early American circus in the antiquarian collections. After an investigation I discovered that very little had ever been written on the subject. This prompted me to write a monograph entitled *The Early History of the American Circus* (1934). I had a lot of fun gathering the facts, and later I put on a circus exhibition in one of the New York museums. Since then I've acquired quite some notoriety as a circus fan."

One project Vail was very glad he followed through to completion while at Worcester was concerned with the drawings of the French artist Charles Alexandre Lesueur. In 1937 the librarian came upon a reference in the library's records that Lesueur's sketches of America, drawn in the early nineteenth century, were at the National History Museum at Le Havre in France. This famous French naturalist and artist, who had come to America in 1816 to collect zoological specimens, had been so impressed with the country that he had remained for a number of years as art instructor in New Harmony, Indiana. During this time he had drawn sketches of hundreds of American towns and landscapes—many of them the only historical representations of that period.

With these drawings in France and their purchase impossible, Vail concluded that even photographs of the pictures would be a valuable acquisition for the United States. He then set about to obtain the permission of the Le Havre authorities to photograph Lesueur's work. Permission granted, he next procured the services of a friend, who traveled extensively, to supervise the work. When the photographs arrived at Worcester, Vail proceeded to prepare a monograph under the title *American Sketchbook of Charles Alexandre Lesueuer* (1938), with a biography of the artist and references to, and identification of, the known locales pictured. The Le Havre library was destroyed in the Second World War; therefore, unless the original sketches were removed to safety, the photographs now at the Antiquarian Society are the only complete record of Lesueur's drawings. There are a few partial duplicate sets in Western historical societies.

In 1939 Vail was offered the post of Librarian of New York State by the New York State Department of Education. After nine years with the American Antiquarian Society the decision to leave was a difficult one for him to make, but it was a challenge to his abilities since much constructive and corrective work was needed. He accepted the offer and was appointed State Librarian in December 1939. His responsibilities included the supervision of the work of a dozen departments; direction of the State medical, law, legislative reference, manuscript, history, and educational libraries; supervision of the services for the blind, the functions of the inter-library loans, the work with the Board of Regents, and the traveling libraries. He was also directly responsible for the selection and acquisition of material relating to New York State history and the replacement, wherever possible, of all books, maps, prints, and manuscripts destroyed by fire in 1911. In addition, it was also his duty to weed out and replace books in all the departments.

When Vail left Albany to assume the directorship of the New York Historical Society in September 1944, the problems at the New York State Library had been tackled and the library's functions redirected toward more constructive purposes. The traveling libraries had over a half a million up-to-date volumes in their collection, with postwar plans to serve those rural areas not covered before. Additions were made to the State historical material, and people were encouraged to donate valuable reference matter. All the book collections have been improved, and inter-library loans expanded. Students were urged to make the most of the source material, and Vail himself took such a personal interest they would often ask his advice in selecting subjects for their theses. Authors and historians also frequently came to him for the assistance which he gladly gave.

As director of the New York Historical Society, Vail retains the same fundamental aim —to acquaint the public with the wealth of material available at the Society so that readers and researchers will make use of it. This collection differs from the usual library in that it consists of paintings, furnishings, folk art, and other historical materials, in addition to the vast printed and manuscript resources in the reference library. It is this combination of museum and library which makes the institution unique.

It is the ambition of the director to work closely with schools and colleges and to reach professors as well as the graduate students, who will be the historians of tomorrow. "So often," remarks Vail, "we find that a book is published on a certain subject without the author knowing of the wealth of facts which were obtainable here at the Society." When asked once what exhibit seems to hold the greatest interest for the public, he replied, "With the diversified interests of our visitors, each has his favorites. American textiles or old advertisements may appeal to some, early American furniture or utensils may appeal to others, and ships might be the fancy of many. In fact," he chuckled, probably thinking of his own experience in Worcester, "quite a few enjoy an exhibit of old circus posters."

Vail's other activities are closely related to his work. In 1942 he was president of the New York State Library Association. For a number of years he represented the Antiquarian Society and the Bibliographical Society at the National Council of Learned Societies. He is a member of the American Library Association Council, and one of the consultants for the Library of Congress. In 1945 he was compiling a bibliography, "American Indian Captivities."

Six-foot, two-hundred-pound Robert Vail has a light complexion and silver-gray hair, which is receding slightly from the temples. His voice is soft and his speech calm and deliberate. Deeply interested in people and world affairs, he feel strongly that education is one of the answers to the problem of maintaining a permanent peace. If the resources of the Society can contribute to this knowledge, he says, his work and that of the staff will have been well worth the effort. "I used to collect rare books and manuscripts," he said once when asked about his hobby. "At one time I had one of the finest collections of material on western New York history in private hands, but I was competing with my own profession and livelihood so I had to give up my hobby. My favorite pastime now," he continued, "is my job here at the Society."

Obituary

N Y Times p11 Jl 21 '45

VANDENBERG, HOYT S(ANFORD) Jan. 24, 1899- United States Army Air Forces officer

Address: b. c/o War Department, Washington, D.C.; h. 4000 Cathedral Ave., N.W., Washington, D.C.

Of all the great Allied air fleets on the European continent, the largest was the United States Ninth Army Air Force, which gave tactical cooperation to ground commanders in their fight against the Germans. The Ninth's commander, a brilliant but little known flier and planner, was Lieutenant General Hoyt S. Vandenberg. He is called "one of the chief architects of the system of air and ground cooperation." In July 1945 he was appointed assistant chief of the Air Staff in the Army Air Forces.

A descendant of the early Dutch settlers of New York, Hoyt Sanford Vandenberg was born in Milwaukee, Wisconsin, on January 24, 1899. His parents were William Collins and Pearl (Kane) Vandenberg, and Michigan's influential Republican Senator Arthur H. Vandenberg '40 is his uncle. After some study at the Columbian School, young "Van" Vandenberg obtained a Michigan appointment to the Military Academy, where he was a hard-working but not brilliant student, graduating in the bottom tenth of his class. The tall, handsome twenty-four-year-old "made the air grade," however, "by reason of his superb physical condition" (to quote *Time*), and was commissioned a second lieutenant in the Air Service in June 1923. That September he entered its Primary Flying School at Brooks Field, Texas, and was graduated from the Advanced Flying School at Kelly Field a year later. At this time Lieutenant Vandenberg was married to Gladys Rose of Tuxedo, New York, whom he had met at a West Point dance. The couple, whose home is in Washington, have a daughter, Gloria Rose, and a son, Hoyt Sanford.

On the completion of his training Vandenberg joined the Third Attack Group at Kelly Field, transferring with it to Crockett Field, Texas, in August 1926, the year the Air Service became the Air Corps. One of the Army's best attack pilots, the Lieutenant was chosen

U. S. Air Forces

MAJ. GEN. HOYT S. VANDENBERG

to be an instructor at the Air Corps Primary Flying School, March Field, California, in October 1927. His promotion to first lieutenant came through ten months later. Next Vandenberg was sent to Schofield Barracks, Hawaii, in May 1929, to join the Sixth Pursuit Squadron, and was placed in command after he had been there six months. Back in the United States in September 1931, the thirty-two-year-old lieutenant again became an instructor, teaching flying at Randolph Field, Texas, where he was made a flight commander in March 1933. Then he himself went back to studying, attending the Air Corps Tactical School at Maxwell Field, Alabama, from August 1934 to June 1935, and entering the Command and General Staff School (at Fort Leavenworth, Kansas) as a captain the following August. After about two years on the faculty of the Tactical School, Vandenberg was enrolled for the Army's highest training at the Army War College on March 28, 1938. Graduated in April 1939, he was assigned to duty in the Plans Division of the Office of the Chief of Air Corps, where he served until July 1941, when he was placed on the staff of the AAF chief, General H. H. Arnold '42, and advanced to the permanent rank of major.

At this time, when the involvement of the United States in the Second World War was imminent, President Roosevelt '42 instructed General Arnold to prepare the strategic plans for the air forces. Working under high pressure, the air staff formulated its plans, to which Vandenberg contributed a "wise evaluation of the situation created by the requirements of air power set against the national matériel and personnel resources." He had the delicate task of balancing defense and training needs against the need of planes to carry the fight to the presumptive enemy, and then supervised the carrying-out of his allotment program, all on a hitherto undreamed-of scale. In March 1942 Colonel Vandenberg (raised to the temporary rank of lieutenant colonel one month before Pearl Harbor and to temporary colonel in January 1942) became operations and training officer (A-3) on the Air Staff. His work in Washington and in Britain, where he worked on air plans for the North Africa operations under General Dwight Eisenhower '42, won him the Distinguished Service Medal with a citation for "exceptional ability, energy, judgment, and brilliant professional knowledge."

While in Britain, Vandenberg was given, in October 1942, the job of organizing the Twelfth Air Force as its chief of staff, under General James Doolittle '42. "In the face of almost insuperable difficulties due to lack of time, experienced personnel, and equipment," he and Doolittle whipped together an "excellently organized" tactical air force to cover the Allied ground troops fighting in North Africa. (The quotation is from the document accompanying Vandenberg's Legion of Merit.) The Twelfth included bombers, fighters, air support units serving under ground commanders, a troop carrier wing, and service commands. Its fighters and bombers took on the Luftwaffe in November 1942, and proceeded to account for more than four hundred enemy planes in the next three months, wreaking ground and air destruction on the Germans equal to many times their own losses. The citation above calls this accomplishment "a tribute to his [Vandenberg's] organizational and administrative ability." In February 1943 all the Allied air forces in the theater were merged into the Northwest African Air Forces, under Lieutenant General Carl Spaatz '42, which was subdivided into five service units and three air forces, the Coastal, Tactical, and Strategic. Vandenberg was chief of staff of the last-named, planning and supervising the air operations over Tunisia which largely prevented the Germans from bringing in needed supplies and reinforcements.

At the same time the dashing colonel, who became a brigadier general (temporary) in December 1942, used to "sneak off on combat missions" with or without Doolittle, winning the Silver Star by his "display of gallantry and courageous leadership." Flying as copilot, gunner, or observer, he took part in all types of bombing attacks over Tunisia, Sardinia, Sicily, Italy, and Pantelleria. Vandenberg, it seems, had a lot of fun—and then came back with recommendations about tactics, techniques, and discipline which "added immeasurably" to their improvement. This "achievement far above and beyond the requirements of his position" won him the Distinguished Flying Cross, as well as the Air Medal with four Oak Leaf Clusters (indicating that he had made at least twenty-five sorties). Vandenberg wears the wings of a command pilot, and is rated a technical observer and aircraft observer.

In August 1943 the Wisconsin-born flier was ordered back to the United States and assigned to AAF headquarters in Washington as one of the four deputy chiefs of Air Staff. After six months in this post he was made a major general (temporary) and sent overseas to join "Ike" Eisenhower's Supreme Headquarters staff in London as deputy commander in chief of the Allied Expeditionary Air Forces. Here he impressed the British with his tactical planning, which they described as "outstanding." A natural diplomat, Vandenberg was on the President's military staff at the Quebec, Cairo, and Teheran conferences; *Time* states that he "helped persuade the Russians to give the Allies air bases." His work in this post and as deputy commander of the Ninth United States Air Force, the largest on the Continent, won him a Cluster (indicating an additional award) to his D.S.M.

Beginning in early 1944 the Ninth, which was composed of tactical air commands, was engaged in a campaign against enemy fortifications on the Channel coast and in occupied areas; it also provided fighter protection on the long missions of Major General Frederick L. Anderson's '44 Eighth (Strategic) Air Force heavy bombers. When the Ninth's commanding general, Lewis Brereton '43, was picked in the summer of 1944 to head the newly formed First Allied Airborne Army, Eisenhower chose Van Vandenberg to succeed him.

As a tactical air force, the Ninth's job was first to destroy the enemy air force, and secondly to isolate the field of battle. Unlike the strategic bombing units, which were charged with breaking down enemy production on a long-range basis, the tactical forces were concerned with the immediate situation: with paving the way for ground advances, preventing the enemy from bringing in supplies and reinforcements, blocking his retreat, and knocking out specific positions and vehicles. The Eighth faced losses from flak and enemy air attacks; but the planes of the Ninth, constantly engaged in dive bombing and strafing (gunning ground positions from the air), came under concentrated antiaircraft fire. Often they flew within range of rifles and even pistols. As a result, the "rate of attrition" which had been worked out on a basis of the Eighth's experience proved too low: *Newsweek* reported in December 1944 that "some Ninth groups have suffered casualties of almost 50 per cent. At times squadrons of twenty-five planes have had only eight or nine planes in operation....Changes were made just in time to avert serious consequences."

The General has reportedly "wielded the weapon of his big air force with skill and devotion," working with various Allied armies as they dashed forward or inched grimly along in Western Europe. "If other top airmen had any criticism of the Ninth," wrote one reporter, "it might be that its forces had got to working too closely with ground force commanders," thus running the risk of "giving extra ground support at the expense of sound tactical air doctrine." (This would be the case if, for example, the fighter-bombers were too busy themselves knocking out tanks to such an extent that they failed to attack enemy communications.) But hard-driving General George S. Patton '43 declares that the Third Army's amazing drive through France in August 1944 would have been impossible without the Ninth Air Force's help. "I make the German armies move so fast they have to use the roads," explained Patton in more colorful wording, "and the Ninth bombs and strafes them off the roads." New York *Times* correspondent Clifton Daniels called Vandenberg's force "specialists in routing armies," and said its planes were piloted by "some of the keenest gunners on any front."

General Vandenberg, who was given his third star in April 1945, issued this summary of his air force's work in May. The Ninth, which was reported by Leland Stowe '40 to be almost as large in personnel as Patton's Third Army, made its last flight against Germany on May 8. Its final score stood at nearly four hundred thousand flights in nineteen months; to a loss of fewer than three thousand planes, mostly fighters, and less than five thousand personnel killed, wounded, or missing, they had destroyed more than four thousand German planes in the air and on the ground, and more than three thousand "probables." Other destruction wreaked on the enemy included: more than thirty-six hundred motor vehicles and sixty-seven hundred horse-drawn vehicles; seven thousand locomotives and sixty thousand railroad cars, plus "uncounted thousands" of others smashed in attacks on railroad yards; sixty-five hundred tanks and armored vehicles; and seventeen thousand gun positions and fortified buildings. That March Vandenberg had been made a commander of the French Legion of Honor; and that July, after his return to the United States, he was appointed assistant chief of Air Staff in charge of operations. In October he was one of three air officers (the others were Major Generals Curtis E. LeMay '44 and Lauris Norstad) to be nominated by President Truman '45 for permanent brigadier generalcies for which they lacked the years of service required by law. Special legislation was therefore needed to permit their appointment.

Hoyt Sanford Vandenberg, Sr., is a general whom movie audiences would approve on sight. Six feet tall and slim (one hundred and sixty-five pounds), he has gray eyes, streaked iron-gray hair, and an impeccably groomed sort of good looks, with charm to match. *Time* reported that he "seems always to be in action . . . usually flies his own Thunderbolt in hops to staff headquarters . . . combines the energy of an athlete with mature judgment. He is dead serious and fluent about anything having to do with aviation, reasonably interested in such lesser matters as golf (low eighties), tennis, gin rummy, Scotch highballs, and good panatelas," beating his aircrewmen and enlisted men at volleyball and ping-pong, and forcing his reluctant staff to join him in quartets in the evening. The General, it is reported, cannot carry a tune.

VILLA-LOBOS, HEITOR (vē'lä-lō'bo͞os ā'tôr) Mar. 5, 1884(?)- Brazilian composer

Address: b. Departamento de Educação, Rua São Cristovão, 18, Largo Estacio, Rio de Janeiro

The leading South American composer, "a sort of Berlioz of the New World"—individualist, innovator—Heitor Villa-Lobos is one of the most prolific composers of all time, being credited with fourteen hundred compositions ranging from simple songs to intricate musical works. One of the first truly national composers of Latin America, a Brazilian writing true "Brazilian music," he has had a decided influence on other Latin American composers, and is, according to Olin Downes ['43], "one of the greatest creative figures in the field of contemporaneous composition."

Heitor Villa-Lobos was born in Rio de Janeiro on a certain March 5. But, as Nicolas Slonimsky writes, "among other things Villa-Lobos does not know about himself is the year of his birth. Friends of his family say . . . that he was born in 1881, but Villa-Lobos prefers 1888. He is also experimenting with the years 1886, 1887, and 1890. There is no chance of finding documentary evidence . . . for the registries of birth were not established in Rio de Janeiro until the 'nineties of the last century." The records are clearer, however, in regard to the composer's parents. His father, Raul Villa-Lobos, was an author of historical works and an amateur cellist of some repute; his mother was the former Noemia Monteiro. The boy's father taught him the rudiments of music and gave him some instruction on the cello, but he was largely self-taught. Although some sources state that he was forced to leave school at eleven, following his father's death, to take work in restaurant and third-rate theater orchestras, there is also evidence that his education extended beyond this early age. *Who's Who in America* lists the schools that he attended as Colegio Pedro II, 1897-1901; Colegio São Bento, 1900; and Institute of Music in Rio, 1901, where he is said to have studied briefly with Agnello França and Francisco Braga, although he was always impatient with accepted musical forms. Nevertheless, before he was very old it is believed he had become proficient in playing several instruments, including the piano, the guitar, and a number of wind instruments.

Meanwhile, too, the youth was making friendships among prominent Brazilian musicians and composers, "reveling," writes Andrade Muricy, "in the great musical orgy in which the music of Rio de Janeiro was assuming a definite character. . . .Popular music flourished then with complete spontaneity," and was not "flattened into the banality of a standard type. Villa-Lobos," continues Muricy, "listening somewhat absent-mindedly with one ear to classical music, absorbed with the other . . . the fundamentals of the popular style." Then, within a few years, he had discovered another world, the world of native Brazilian music. He made several trips through the northeastern part of his country—Espírito Santo, Bahia, Pernambuco, Manaus—(in 1912 with a scientific expedition), and there he absorbed the elements of Portuguese, African, and Indian folklore among the tribes, becoming familiar with the ceremonials of the natives. At first he composed waltzes and schottisches, and only a few folk songs, aware that music imbued with the rustic and pagan elements of the hinterland would be given a cold reception in sophisticated Brazilian society. But "at length," says Muricy, "Villa-Lobos arrived at the critical and decisive epoch of his life when the necessity of asserting himself coincided with the need for defining the music of his race."

"It would be very convenient for the critic and for the historian," wrote Muricy in 1945, "if Villa-Lobos' work had developed in a measured and balanced way, but his production was not cast in a definite mold. . . .What Villa-Lobos did try to express was the Brazilian nebula with all its vagueness, but also with the power to persist and strengthen. The Brazilian soul is an inchoate world where moments of pure sensuous delight and the astringent savor of our tropical fruits alternate or mingle with the surges of primitive barbarism."

By studying the folk-songs and rituals of the Negroes and Indians, Villa-Lobos had become intimate with native folklore, melodies, and rhythms, and now could re-create them in new forms, with color, sentiment, design, rhythm. He was equipped with "a new technique and musical prowess so novel and exotic in its use of weird harmonic innovations and chordal progressions that the musical world was rocked to its foundations." His absence of formal education, writes Nicolas Slonimsky, was not a handicap, for he was "not bound by conventional ideas of Western harmony, utterly unsuitable for the melodic inflections of Brazilian song. . . .Inasmuch as drums make up the only native orchestra of primitive tribes, the compositions in which Villa-Lobos embodied the product of his research are rich in percussion of all kinds. In public performance these native instruments are of the essence, and cannot be replaced by kettle-drums or any other percussion instruments of European origin."

In 1914 Villa-Lobos wrote his first big orchestral composition, a set of three dances exhibiting the primitive influence, which he entitled *Dansas dos Indios Mestiços* ("Indian Mestizos"). Prior to this, in 1912, he had also written an opera in three acts, *Agláia,* and in 1914 a four-act opera, *Izaht.* In 1915 he gave a concert of his own works, principally chamber music, then, in the next few years, turned out "a flood of music" of varied types. Since the symphonic form is a favorite of Brazilians, it is not surprising that the work produced in this period included a number of symphonies and about ten symphonic poems. At the close of the war, 1919, his third symphony ("The War") was heard. "Hyperromantic and hauntingly descriptive," it is said, it conveyed the anguish and foreboding of prewar days, and the violence of the ensuing war.

Recognition outside of Brazil first came to the composer in 1919 when Artur Rubinstein ['45], during a concert tour of South America, happened to hear one of Villa-Lobos' compositions played in a motion picture theater. Rubinstein sought out the composer, who was playing in the orchestra, and who seemed incredulous when the foreign artist expressed his pleasure. Nevertheless, Villa-Lobos a little later, accompanied by a whole orchestra, appeared at the pianist's hotel prepared to play more of his own works. After listening to an hour's performance, Rubinstein was even more enthusiastic, and the result was that he saw to it that an influential Brazilian arranged for Villa-Lobos to go to Paris on a Government fellowship. Said Rubinstein, "Villa-Lobos creates with force and facility of a genius; from the viewpoint of fecundity and facility of expression, he reminds me of Schubert."

Villa-Lobos remained in Paris until 1926. He had already become acquainted with the work of the Impressionists and other French composers through Darius Milhaud ['41], who was at the French Embassy in Rio de Janeiro from 1917 to 1919. In France the Brazilian came into contact himself with this young school of musicians. "He was a composer already formed when he came to Paris," wrote Burle Marx in 1939; "his musical compulsion was more powerful and rich than that of most Europeans. He arrived with curiosity but supreme confidence; his attitude was, 'I didn't come to study with you, I came to show what I've done.'" However, comments Slonimsky, "there is no mistaking the influence of French impressionism and early neoclassicism on Villa-Lobos' music of the Paris period." His success abroad was almost instantaneous. Since that time Paris, then the musical capital of the world, has considered him one of the major modern composers. Discussing his years in Paris, Villa-Lobos himself has said: "I was there, and I listened attentively, but never allowed myself to be influenced by any of the novelties I heard."

When the composer returned to Brazil he found that the acclaim abroad had elevated him in the esteem of his countrymen. Before going to Paris he had begun work on a series of compositions, a type of sentimental folk serenade called *"chôros"* by Brazilian street musicians. From 1920 to 1929 he composed fourteen of these serenades, each entitled *Chôros* (and numbered), which were written for various instruments. *"Chôros,"* says Villa-Lobos, "represents a new form of musical composition in which a synthesis is made of different types of Brazilian music, Indian and popular, reflecting in its fundamental elements the rhythm and characteristic melodies of the people." "The harmonic treatment," he continued, "represents a stylization of the original material." The first of the group is a simple guitar solo, but each successive piece becomes more elaborate, the fourteenth calling for full orchestra, fanfare, and mixed chorus. The two most important groups of Villa-Lobos' works are considered to be these *Chôros* and his *Serestas*, which are Brazilian songs patterned after the serenade, but freer in style, written for cello and piano. The *Serestas* form the most noteworthy group of Brazilian songs since those of Nepomuceno, while the *Chôros* are the "backbone of his [Villa Lobos'] work and, taken together, his masterpiece."

In classifying the prolific composer's other works, musical catalogs list them as vocal works, suites, concertos, chamber music, and songs, and works for piano, orchestra, and the theater. (He has written several operas and eighteen ballets for the theater.) One critic in the early 'forties calculated that if all of Villa-Lobos' works listed in catalogs were played "end to end," seventy-five hours and fifty-seven minutes would be required for the performance. (Two of the artists who have recorded a number of the composer's works are Bidu Sayao ['42] and Jennie Tourel, of the Metropolitan Opera Company.)

HEITOR VILLA-LOBOS

Villa-Lobos' work reveals that he is a programist in that all of his works present a story. His métier is the transmutation of folk tunes. He takes a folk tune or a primitive rhythm, re-creates it, building it into his own composition. Emphasizing that he is not a folklorist, but a creative artist inspired by folklore, he says: "I compose in the folk-style; I utilize the themes in my own ways and subject them to my own development."

The music of Villa-Lobos is considered unorthodox—"a musical dialect made from aboriginal shouts and strummings," an orgy of color, a diversity of novel sonorities and pungent rhythms. North Americans describe his style as "a dazzling, ingenious mixture of jungle boogie-woogie, sophisticated orchestration, five-sixteenth rhythms, Latin dance tunes, and instrumental oddities." The rendering of an effective interpretation of his music requires a comprehension of his independent technique of composition which capitalizes on the resources of the piano (though "sometimes doing them violence") and an appreciation of his compelling and intricate rhythms. In spite of Villa-Lobos' indifference to an orchestra's powers, his compositions are not unplayable. One of the reasons often given for the neglect of his work in North America is the problems his scores present to non-South American orchestras, usually lacking in a "kitchen" section. His scores call for unusual instruments such as gourds, rattles, notched sticks, box-like drums, and the caxambu (a gravel-filled bottle).

Of Villa-Lobos' scoring, Olin Downes says, "One scents as well as hears the forest, sees the play of lights, is aware of the tropical night and its strange enchantment." Oscar Thompson's over-all impression of Villa-Lobos' compositions is that they are too loosely woven, "risking monotony through their

VILLA-LOBOS, HEITOR—*Continued*

waste spots and repetition of accompaniment figures. But the color of what he writes is always interesting."

As an adjunct to his musical qualifications, his love of children made him the natural choice in 1931 for the position of director of Brazil's Department of Musical Education. The story is told that he persuaded President Vargas '40 to establish such a department by pointing out that people interested in listening to music and singing together would have little desire to instigate revolution. Villa-Lobos has given choral singing in the schools unprecedented attention: "Mass singing is the best and simplest way to make a nation musical," he declares. He drilled schoolteachers in a method of notation of his own devising (by raising or lowering the fingers to signify the notes), thus establishing a means of musical communication to great numbers of children, and used it to spread through Brazilian schools an enjoyment of both classical music and folk tunes. He also established a training school for teachers called the Orfeão de Professores. Each year on Brazil's Independence Day, September 7, he conducts a chorus of some twenty thousand school children, directing from a tower in the center of Rio's largest stadium.

Choruses of a thousand or more voices have often sung under the direction of Villa-Lobos. In 1931, at São Paulo he led the most impressive musical presentation in the history of Brazil up to that time when he conducted a chorus of one thousand voices and an orchestra of four hundred pieces through a sweeping program of native music. When the National Education Congress met in Rio de Janeiro in 1935 Villa-Lobos directed an even larger group—thirty thousand singers and an orchestra of one thousand. In that same year he had a contract with the Teatro Colón in Buenos Aires to direct ten concerts and four ballets, and the next year he was delegate to the International Congress of Musical Education at Prague, and to the International Meeting of Melody and Piano at Vienna.

One of the most unique devices for teaching children to write music is by means of Villa-Lobos' "millimetric music chart." A sentimental idea that the Corcovado and Sugar Loaf mountains had been "waiting for millions of years for people capable of reading and expressing the music of their unique lines" inspired Villa-Lobos' creation of this chart. It is set up in the form of a graph having "in vertical columns on the left side the diatonic, chromatic, and other scales, with one note for each horizontal line." Using photographs of Brazil's major mountains, he traces their outlines along the graph with the base of the mountain on any note that suits his whim. The rhythm is arbitrary and the melody may be harmonized in any style.

From a photograph of Manhattan's skyline Villa-Lobos, in 1940, set down on a graph the pinnacles of the buildings in relation to one another, and sketched a melody based on the C-minor scale, explaining that "the feeling the photo gives me is distinctly minor, though I know that the interior of the city is distinctly major." (He had then not been in New York.) In a little less than two hours the composition was completed. In its final form, harmonized for voice (without words) and piano, it was recorded as the *New York Sky Line Melody*, which had its initial international broadcast from Rio de Janeiro to New York on the opening of the Brazilian Building at the New York World's Fair in 1940. On seeing New York for the first time five years later, he proudly remarked that the *New York Sky Line Melody* needed no alterations.

In 1940 the Museum of Modern Art in New York, with the Commissioner General from Brazil to the World's Fair, presented a five-day festival of Brazilian music, devoting the greater portion of the program to the works of Villa-Lobos. Among the selections played were the *Nonentto*, written in 1923 and considered his chief chamber music composition. The critic of the New York *Times* found it had "intensity and cumulative power. . . . It contains an almost brash interplay of colors, harmonies, and rhythms." The composer's *Bachiana Brasileira* No. 1 (one of the five suites revealing Villa-Lobos' interest in Bach, and his desire "to transmit the spirit of Bach . . . into the soul of Brazil," though never trying to imitate him) proved to Olin Downes that Villa-Lobos is a composer of "extraordinary force, originality, and fertility." The highlight of the festival was the playing by Artur Rubinstein of the Brazilian's *Rudepoêma* ("Savage Poem"), one of the most difficult piano compositions ever written. It was dedicated to Rubinstein, of whom it is a musical portrait. The pianist has also popularized Villa-Lobos' *Prole do Bébé* ("Child's Family")—three sets of piano pieces about dolls. Paradoxically, few children are advanced enough to play or understand these difficult selections.

In December 1944 South and North America saw a bond of friendship in the first visit of Villa-Lobos to the United States. He conducted the Janssen Symphony of Los Angeles at his initial American public appearance; then made his New York debut by conducting the Philharmonic-Symphony Orchestra in the playing of his *Chôros* Nos. 8 and 9. Virgil Thomson '40 stated that these were "excellent tunes; their varied instrumentation, their abundance of fancy in general, and their easy but perfectly real modernity of thought have placed them in a repertory as valid musical creations of this century." *Musical America*'s judgment was: "One of most stimulating evenings of music that New York has enjoyed in many a moon was afforded by this wildly heterogeneous program. Mr. Villa-Lobos also appears to be a much better conductor than most composers are; at least, the orchestra performed the fiendishly intricate scores for him splendidly."

A week later, sharing the podium with Leopold Stokowski '41, Villa-Lobos conducted the New York Symphony Orchestra in his symphonic poem *Uirapura*, and his seventh *Bachiana Brasileira*. Again *Musical America*: "His gift is basic, luxuriant, and tremendously vital. It has about it the naïveté and simple childlike directness of that true genius which is so strong in its own right as to have no need of pose, cleverness, rhetoric, or any of the other mechanisms commonly employed to bolster slender talents." The musician also made guest appearances in Chicago and Kansas City.

On invitation from Serge Koussevitsky '40, Villa-Lobos next appeared as guest conductor with the Boston Symphony Orchestra. During his stay in the United States the Brazilian composer wrote a new Fantasia for cello and orchestra, which he dedicated to Koussevitsky; a ninth Bachiana, dedicated to Aaron Copland '40, the American composer; and a Concerto for harmonica and orchestra for Larry Adler '44, of whom he is an ardent admirer. He also studied pictures of the mountains in America in preparation for his next work, his seventh symphony. In February 1945 the United States League of Composers set aside the week of the nineteenth as "Villa-Lobos Week," in honor of the composer's first visit to the States. Another honor was given to him when he received in 1945 the Koussevitzky Music Foundation commission for a symphonic work. In the same year, together with Lorenzo Fernandez, another Brazilian composer, Villa-Lobos founded the Brazilian Academy of Music, which is modeled after similar institutions in Europe. Its membership will be fifty, forty composers and ten musicologists.

Author of several literary works among which are *Alma do Brasil* and *Programa de Musica* (an official publication of the Department of Education, 1934), this "plump, gay, and bouncy Latin," is a member of many musical organizations, most of them in Brazil, Mexico, and France; and he is honorary director of various musical institutes in Brazil and abroad. He has conducted orchestras in Paris, Brussels, and Barcelona; and is a recipient of honorary decorations from Belgium, Spain, and Portugal. In 1910 he was married to a well known Brazilian concert pianist, Lucilia Guimarães. An enthusiastic billiard player, Villa-Lobos is Rio's three-cushion billiards champion. His favorite bit of tribute to himself as a musician is, "Better bad of mine than good of someone else."

WAESCHE, RUSSELL R(ANDOLPH)

(wā-shē) Jan. 6, 1886- United States Coast Guard officer

Address: b. c/o Coast Guard Headquarters, 1300 E St., N.W., Washington, D.C.; h. 7005 Rolling Rd., Chevy Chase, Md.

ADM. RUSSELL R. WAESCHE

The least known of the armed forces of the United States is also the oldest—the Coast Guard, established in 1790 by Alexander Hamilton to prevent smuggling. Civilians, who refer to Coast Guardsmen as Coast Guards, usually fail to recognize the insigne on a Coast Guardsman's sleeve or lapel, and assume that the wearer is a Navy man; and the confusion is increased by the fact that the Guard, a Treasury service in peacetime, does operate under the Navy in a war. It is, however, a separate service, like the Marine Corps, with its own proud traditions; when the marines land, in fact, the Coast Guard is there to direct them. Heading its diverse services is Admiral Russell R. Waesche, who has been the Commandant longer than his opposite number in any of the other branches (Army General Marshall '40, Fleet Admiral Ernest King '42, and Marine General Thomas Holcomb '42). Waesche's feeling about his Service is reflected in his booklet, *Deeds of Valor From the Annals of the Coast Guard*, which bears the Guard's secondary motto, "You have to go out, but you don't have to come back."

Russell Randolph Waesche was born in Thurmont, Frederick County, Maryland, on January 6, 1886. The son of Leonard Randolph and Mary Martha (Foreman) Waesche, he attended the Maryland public schools. At fifteen he enrolled in the electrical engineering department of Purdue University, where an elder brother was an instructor. "I didn't have too much dough," the Admiral says. "With my brother teaching at Purdue I figured on saving some of my board bill." After a year Waesche's brother told him that he was too young to appreciate a college education, and should get "a little military training" first. As it happened, the competitive examinations for the Coast Guard Academy were announced just then, and young Russell took them. Appointed a cadet, he completed his Academy training and was then commissioned an ensign in October 1906, beginning twelve years of service as a line officer aboard cutters and destroyers in Atlantic, Pacific, and Arctic waters. "When I woke up," says Waesche, "I found I liked the Service too much and was too old to get back to electrical engineering."

The future admiral began his rise through the grades with promotion to lieutenant (junior grade) in 1907. He was married in 1911 to Dorothy Duke, by whom he had three sons.

WAESCHE, RUSSELL R.—*Continued*

During the Second World War, one of them, Harry Lee Waesche, was to serve as a lieutenant colonel in the Army Air Forces, while Russell Randolph, Jr., and James Mountford Waesche were in the Coast Guard—the former as a lieutenant commander, the latter as a petty officer (noncommissioned). The Waesches were divorced in 1926.

Advancement to full lieutenant came to Russell Waesche in 1917, when he was serving a three-year term as first head of the Division of Communications. When he assumed this post in 1916, with Europe already at war, the Guard's coastal communications system consisted of about 1,435 miles of overhead telephone wire and sixty-five miles of undersea cables—far from the complete coverage desired. Waesche "organized, modernized, and extended" the system, supervising the placement of many miles of new line and acquiring others. By the end of the war, due to Waesche's efforts, the Coast Guard controlled and operated some three thousand miles of communication lines, connecting the Coast Guard stations with each other and with other points, such as lighthouses, and operating in conjunction with naval radio stations. As a by-product, Waesche made a name for himself as "a man with ideas for solving tough Navy problems."

After the passage of the widely violated Eighteenth Amendment, the Lieutenant was assigned to the offshore patrol to prevent rum-running, commanding a destroyer division. Promoted to lieutenant commander in 1923 and to commander three years later, in 1928 Waesche left the sea to become chief ordnance officer at Coast Guard headquarters in the Treasury Department in Washington. In 1931 he effected a reorganization of the Guard's field forces, with time out to serve as harbor master at the Yorktown Sesquicentennial, and a year later was assigned to four months of liaison work with the Navy's War Plans Division, in the Office of the Chief of Naval Operations. Then the forty-six-year-old officer was honored by being chosen aide to the Coast Guard Commandant, leaving this duty when appointed chief of the Finance Division. In June 1936 President Roosevelt '42 passed over many senior officers to appoint Commander Waesche Commandant of the entire Coast Guard for a four-year term, elevating him two ranks to rear admiral.

The new Commandant "streamlined the administrative setup" of the Service, of which the personnel then numbered between nine and ten thousand, and originated the Coast Guard Institute and correspondence school for warrant officers and enlisted men. He is responsible also for the extensive gunnery practice given Coast Guardsmen. At the Yorktown Sesquicentennial he had made the acquaintance of various Congressmen and dignitaries and had impressed Representative Schuyler Otis Bland of Virginia with his "splendid services." Bland was chairman of the House Committee on the Merchant Marine and Fisheries, which has jurisdiction over Coast Guard legislation, and this was the beginning of Admiral Waesche's enviable relations with the Congress. He was said also to be popular with his subordinates and to work well with his civilian superior, Assistant Secretary of the Treasury Herbert E. Gaston, who had charge also of the Customs and Narcotics Bureaus, the Secret Service, and Treasury law enforcement generally.

The enforcement at sea of Federal laws is one of the Coast Guard's two basic civilian functions; the other is service to the seagoing public. The first of these functions involves such diverse details as the apprehension of smugglers, the protection of seal herds, the policing of harbors, and the prevention of illegal whaling. The Coast Guard is charged with safeguarding life and property on inland waterways as well as at sea, which involves every service from inspecting merchant ships to manning an iceberg patrol and a weather survey, and from providing lighthouses and other navigational aids to supervising the training of merchant mariners. During the J. Edgar Hoover '40 headline era, the Guard activities won it the nickname "the G-men of the sea." In peacetime, too, Coast Guardsmen make an average of fifteen sea rescues every day, maintaining nearly two hundred lifeboat stations for the purpose, and provide relief in stricken areas. At the same time, the Commandant has to see that the Guard is kept in good military order, ready to become an effective part of the Navy whenever it may be necessary.

As the war in Europe became ever more certain, Waesche's duties became more complex and demanding. With the effectuating in 1939 of the Neutrality Act of 1937, his command was charged too with neutrality patrol: preventing the shipment of war materials to any of the belligerent nations. Quick antisabotage work was called for in regard to foreign ships in American ports. To quote an official report: "Along the Nation's forty thousand miles of seacoast and inland waterways, the officers and men, the cutters, boats, and planes of the Service maintained a constant lookout, guarding against the illegal entrance and activity of belligerents. Gradually, they extended their activities several hundred miles offshore—as far north as Greenland, where the cruising cutters not only carried out routine patrols, but aided the United States Army in establishing air bases in that strategic region. It was during this time that the cutter *Northland* aided in seizing a Nazi weather station set up in northeast Greenland....At the same time, the Service found itself responsible for new types of duty. One of these was the assignment of cutters to weather ship stations in midocean to supply meteorological data for the safe passage of transoceanic surface and air craft. The technique for this duty had been perfected during the international ice patrols which the Coast Guard maintains on the Grand Banks. But weather ship operation did not begin until early in the year of 1940—when European hostilities forced all ships at sea to maintain radio silence for their own protection."

At the request of the Service, in June 1939 Congress authorized it to organize a voluntary nonmilitary fleet of amateur yachtsmen for auxiliary duties. In addition to this, Waesche was engaged in the expansion of the Coast Guard proper, bringing it up to twenty-five thousand officers and enlisted men by December 1941, more than twice its strength at the time he took office. Reappointed for a second four-year term in 1940, the Commandant was authorized in February 1941 to create a Coast Guard Reserve, toward which end a Coast Guard Reserve Cadet School was established at the Academy in New London; the Coast Guard Auxiliary to organize and train owners of yachts and motorboats; and a Coast Guard Temporary Reserve, composed of civilian men and women who volunteered their services for at least twelve hours each week. By early 1945 there were over fifty-three hundred Temporary Reservists, of whom eighteen hundred were members of the Volunteer Port Security Force, on security patrol in twenty leading ports.

In November 1941 Roosevelt ordered the Coast Guard transferred from the Treasury to the Navy service, where it is a separate arm like the Marines, thus placing the Service on a wartime footing. At this time, two thousand Coast Guardsmen were already operating five Navy transports and manning lifeboats on twenty-two others; some of the expert surfmen were teaching the art of small-boat landings to the Army-Navy-Marine amphibious forces at landing-craft training stations; about forty cutters had been converted to minesweepers, and nearly one hundred fifty were armed and armored for combat. When the Japanese attack on Pearl Harbor brought the country into war, the Coast Guard immediately went on a combat footing.

Admiral Waesche's men established "a constant day-and-night patrol on foot, on horseback, and in jeeps, [including the use of sentry dogs], at almost every point where the Atlantic, the Pacific, and the Gulf touched the United States." Records are hardly a fair measure of any preventive agency, but it was the beach patrol who discovered the two parties of Nazi saboteurs put ashore from submarines in the spring of 1942; and it was the beach patrol, at the time when merchant ships were being torpedoed offshore, who saved scores of the seamen escaping from their sinking ships. Waesche's command also had to take care of "port security"—more than five million linear feet of wharfage had to be protected, most of which had been built "with an almost complete disregard of the fire hazard." For this purpose, Waesche directed the assembling of a fireboat fleet eventually to number more than two hundred fifty, and of a system of surveillance over every ship in every port of the United States, its territories, and later its invaded and liberated foreign areas. Coast Guardsmen were even assigned to supervise the loading of all munitions and other explosives. So successful was this captain-of-the-port system, which at its peak involved more than forty thousand officers and men, including the Volunteer Port Security Force, that in two years no serious waterfront mishap had occurred. The President described this as an achievement exceeding his most optimistic expectations.

One month after Pearl Harbor the first German U-boat struck in American waters. To meet this emergency, the Coast Guard borrowed, chartered, and purchased more than two thousand civilian vessels, many with their owners as temporary reservists, to take patrol stations alongside the regular patrolships. These, operating under the Naval Sea Frontier Command, aided in the coastal convoys, while larger Coast Guard cutters traveled back and forth across the Atlantic, shepherding their convoys of merchant ships and fighting the enemy whenever he showed himself. When the Nazi submarines moved to the Caribbean area the "makeshift fleet" followed, as the Guard laconically puts it, with success. Meanwhile, in March 1942, the President transferred to the Service certain functions of the Bureau of Marine Navigation and Inspection, which meant that it had to regulate and inspect literally everything and everybody concerned with the huge wartime shipping. That July some of the burden was taken off, when the President transferred the Merchant Marine Training Program from Waesche's command to Admiral Emory S. Land's '42 War Shipping Administration.

On August 7, 1942, when the Americans launched their first land offensive of the war at Guadalcanal in the Solomon Islands, Coast Guard officers and men took the marines ashore, manned the attack transport *Hunter Liggett*, and supplemented the crews of a number of Navy ships. Coast Guard beachmasters and beach parties directed the invasion traffic—incoming replacements and supplies, outgoing casualties, and tanks, trucks, jeeps, guns, bulldozers, munitions, food. They have continued to do so in subsequent invasions, manning more and more of the attack transports, as well as the huge troop transports—at Fedala, Casablanca, Safi, Algiers, Oran in North Africa, and at Scoglitti, Gela, Licata in Sicily, the entire Pacific area, and again at Salerno, Anzio, Normandy, and southern France. Army and Navy vessels manned by Coast Guard personnel include troop transports, destroyer escorts, frigates, barges, tankers, tugs, freight ships, and landing craft from LST's to LCI's, to which Admiral Waesche estimated in March 1945 that more than fifty-four thousand men and Coast Guard officers had been assigned. The assignment was made possible by the decreased need for coast and antisubmarine patrol, by the assistance of the temporary reserves, and, after November 1942, by the women's reserve, the SPARS or Spars, so named for the Coast Guard motto "Semper Paratus"—"Always Ready." Under the command of Captain Dorothy C. Stratton '43, former dean of women at Waesche's old university, Purdue, these ten thousand officers and enlisted women served in all except combat capacities. Civilians who never learned to tell a Coast Guardsman from a sailor could distinguish an enlisted Spar from her Wave counterpart; she wore "U.S. Coast Guard" on her hat, a white shield on the right sleeve of her jacket, and the Coast Guard insignia on her jacket lapel.

In March 1942, when Russell R. Waesche was made the first Coast Guard vice-admiral, his command numbered forty-two thousand. By January 1945 it had increased more than four times (more than fifteen times prewar strength) to approximately one hundred seventy thousand, plus fifty thousand temporary reservists added since 1943. In view of "the size and accomplishments of the Coast Guard,"

WAESCHE, RUSSELL R.—*Continued*

a bill was introduced into the House of Representatives and favorably reported on to establish the grade of full admiral for the Coast Guard Commandant. A laudatory Washington *Post* editorial had been placed in the *Congressional Record* by Representative Gordon Canfield of New Jersey the preceding June, and Representative Bland inserted an "extension of remarks" in which he declared, "Admiral Waesche is one of the most efficient, capable, conscientious painstaking, informed officials in the United States Government today." This was on the occasion of Waesche's swearing-in for a third term as Commandant. In March 1945 the bill was passed. The next month Waesche was raised to the rank of admiral, thereby becoming the first Coast Guard full admiral. Because of ill health, however, Waesche's retirement was announced for January 1946.

The Admiral, who has received little personal publicity, is five feet ten inches tall, lean (weighing one hundred and forty-five pounds), ruddy-complexioned, nearly bald. His gray eyes have the sharpness of the expert marksman he is—especially with a rifle. He is described as highly likable. Purdue honored him in February 1944 with the degree of Doctor of Engineering, and that May he was elected president of the Society of American Military Engineers. An Episcopalian and a Mason, Waesche is a member of the Newcomen Society, the National Sojourners, the Propeller Club, and the Society of Naval Architects and Marine Engineers, as well as the University and Army and Navy clubs, the American Legion, and the Military Order of the World War. In 1933 he married Agnes (Rizzuto) Cronin; they have one son, William Alexander Waesche.

WANG SHIH-CHIEH (wăng shĭr jĭ′ĕh′) 1891- Chinese Government official; diplomat; educator

Address: b. Foreign Ministry, Chungking

Any resumé of the career of Wang Shih-chieh, China's Minister of Foreign Affairs, is an account of modern China as well. During his lifetime, which has spanned the past half-century, his country has been in an unsettled political and economic state. China "has been almost continually harassed by civil strife, revolution, and international trouble . . . not to mention disastrous earthquakes, floods, famines, pestilence, inflation, and nationwide starvation." After his appointment in July 1945 the new Foreign Minister was faced with the additional danger that China might try to settle the long-standing hostility between the Government and the Chinese Communists by force of arms, "precipitating a crisis which would involve not only the peace of Asia but the whole world's efforts at recovery from war." In September Wang went to London, where, together with the Foreign Ministers of the other of the Big Five Nations, he began the additional task of "translating into workable and lasting agreements the maze of problems" arising out of the war.

Wang Shih-chieh brings to his new work not only a wealth of experience in law and education (two "arms of civilization" so desperately needed in the settlement of China's problems), but a first-hand knowledge of revolutionary methods. Born in 1891 in the northeastern province of Hupeh, Wang grew up during the period when Sun Yat-sen was attempting to overthrow the Manchu Dynasty, and in 1911 the twenty-year-old Wang took part in the Wuhan revolt which forced the last Manchu emperor to abdicate. His studies at the Paiyang University were followed by special work in economics and political science at the University of London, from which he was graduated in 1917 with a Bachelor of Science degree. He finished his postgraduate work in 1920 at the University of Paris, receiving the degree of Docteur en Droit.

Upon his return to China he was on the faculty of the Peking National University from 1921 to 1927, first as a lecturer of comparative constitutional law and then as dean of the faculty of law. In 1927 he was appointed director of the Bureau of Law Codification in Nanking, and a year later he became a member of the Permanent Court of Arbitration at The Hague. In 1928 Wang was also appointed a member of the Legislative Yuan, the law-drafting and research body of the Chinese Government, which advises on matters of legislation, budgets, and important international affairs. Members of the Legislative Yuan are appointed by the chairman of the National Government, on the suggestion of the president of the Legislative Yuan, for a term of two years.

While he was still a member of the Yuan, in 1929 Wang became president of the National Wuhan University at Wuchang, in his native province. The university is composed of three colleges—arts, science, and law—and is said to be the most beautifully and sumptuously housed of all Chinese universities. (To prevent the university from falling into Japanese hands, it has since been moved, with other refugee colleges, farther inland to Loshan, near Mount Omei in the province of Szechwan.) As a result of his work at Wuhan University, in 1933 Wang was appointed Minister of Education, thereby becoming the highest authority on education administration in China.

The next year Wang's Ministry called a national conference on vocational education, which submitted plans for the organization of specialized vocational schools. As for the university, in May 1934 Wang issued provisional regulations for the organization, financing, and staffing of a postgraduate school, stating that "the underlying motive has been to combine the greatest amount of academic freedom with the minimum of supervision from the Ministry of Education." In 1934, too, Wang reversed a previous ruling which banned private evening schools. "Adult schools," he said, "are not only supplementary to university education but also a means of social reform and social revolution"; and in 1936 he began a campaign to popularize the radio and motion pictures as mediums for social education. Further, he reduced the number of hours of class instruction, to give students more time for free development—a departure from the rigid Chinese tradition in education; and he also established summer research sessions for secondary schoolteachers. On the other hand, he abolished the elective system, and in 1935 approved a standardized curriculum and a Ministry final examination for the universities. In 1935 the National Government took the unprecedented step of establishing a five-year plan for compulsory education to end illiteracy; but the outbreak of hostilities forced it to suspend this program.

In 1939, while Wang was serving as Minister of Education, he was also appointed Minister of Information. He held this position until 1942, and was reappointed in November 1944. During these years he worked to improve Chinese relations with Great Britain, the United States, and other countries. In February 1944, he was head of the Chinese Good Will Mission to Great Britain. That November he began to liberalize the censorship considerably. A leader in China's constitutional movement, in 1938 Wang had become secretary-general of the People's Political Council, China's wartime advisory assembly, which was formed to "utilize the best minds in national affairs and to rally all elements in the country in time of war." A year after the Central Planning Board was established in 1941, Wang also became its secretary-general. Among important measures formulated while he held the latter position was the five-year National Defense and Economic Reconstruction Plan and the ten-year plan for the development of the northwestern provinces.

In 1944 Wang, who is described as one of Generalissimo Chiang Kai-shek's ['40] most trusted advisers, became the Central Government's chief negotiator in dealing with the Chinese Communist problem—"without doubt the thorniest of China's internal political questions." It is the general opinion that his dealings with the Communists, who controlled the entire Northwest Region, led to his appointment as Foreign Minister in July 1945. "The struggle between Chungking and the Communists dates back to 1926, when Chiang took the lead in expelling them from the Kuomintang, the political party which controls China, and then led his armed forces in driving them from the cities they controlled in South China, notably Canton [and in waging an avowed war of extermination against them]." The conflict between Chiang and the Communists, moreover, was only partly submerged while both factions concentrated on fighting the Jap invaders. Upon his return from Yenan, the capital of Red China, in December 1944, Wang said, "One of the most encouraging signs is that the atmosphere is calm and that there has been a marked diminution of recrimination on either side." However, the collapse of Japan in August 1945 brought into sharp focus the long-standing conflict, and the threat of further conflagration was only allayed when the text of the thirty-year Sino-Soviet treaty was made public on August 27. Then it became evident that Moscow formally recognized Chiang's Government as supreme in China, thus withholding by inference any support of the Communist regime in Yenan. Indications that the treaty might end the threat of civil war were seen in the belated acceptance by the Chinese Communist leader, Mao Tse-tung ['43], of Chiang's third invitation to visit Chungking to discuss differences.

WANG SHIH-CHIEH

The month after the defeat of Japan the Foreign Ministers of China, France, Great Britain, the United States, and the U.S.S.R.—Wang, Bidault ['45], Bevin ['40], Byrnes ['41], and Molotov ['40]—began the period of "drawing the framework for the peace." The principles guiding them, said the New York *Times,* "had been laid down in the series of Allied statements and Big Three conferences declarations beginning with the Atlantic Charter in August 1941." China's personal concern in the meeting was with settling the problem of her sovereignty and territorial independence in Asia. After three weeks of almost continuous meetings, however, the first peace conference of the Second World War ended in a deadlock, the Foreign Ministers being able to agree only on terminating their session, Wang returned to

WANG SHIH-CHIEH—*Continued*

Chungking to continue his activity in the negotiations between Chiang Kai-shek and Mao Tze-tung on a plan for a unified government for China. In December 1945 he participated in the all-party People's Consultative Council, composed of representatives of other parties and nonpartisans, in addition to the Kuomintang and the Communist party.

WARNER, ALBERT July 23, 1884- Producer

WARNER, HARRY M(ORRIS) Dec. 12, 1881- Producer

WARNER, JACK L. Aug. 2, 1892- Producer

Address: b. Warner Brothers Pictures, Inc., 321 W. 44th St., New York City; Warner Brothers Studios, Olive Ave., Burbank, Calif.

Warner Brothers Pictures, Inc., one of the largest film organizations in the United States, and the company to introduce sound to the screen, is headed by three brothers, Harry M., the president, Jack L., the vice-president and executive producer, and Albert Warner. Harry Morris, the eldest, was born in Poland on December 12, 1881; Albert was born there several years later, on July 23, 1884; while Jack L., the youngest of the twelve Warner children, was born in London, Ontario, Canada, on August 2, 1892. According to one source, their Russian parents, Benjamin and Pearl (Eichelbaum) Warner, emigrated from Poland with their children in 1890. They lived for a time in Canada before moving in 1894 to Youngstown, Ohio, where Benjamin Warner became a butcher.

ALBERT WARNER

Each of the several sons was expected to contribute a share to the family's income. Harry worked for a time as a cobbler's apprentice, then with Armour and Company, the meat packers. Albert ("Abe") and Samuel, another brother, worked, in turn, at odd jobs before undertaking a new enterprise—the exhibition of moving pictures. The early programs consisted of several pictures, fifty to two hundred feet in length. They used a projection machine they had obtained by pawning Sam's treasured birthday gift from his father, a gold watch and chain. Then Harry, who in later life was to display a sixth sense for business, began to realize the possibilities of the projection machine and soon joined Abe and Sam. The family had always exemplified the motto "One for all and all for one," so Jack, too (who had begun as a singer in minstrels and operettas at the age of twelve), and Rose, their sister, entered the venture. They held showings in the neighboring towns, moving on when there were no people left who had not seen the film. Sam handled the projection machine, while Harry and Albert supervised the advertising and the business ends, very much as they do today. Jack's part was to sing before and after the picture, and to dance while the rest of the family rewound the film. Rose sold tickets and played the piano accompaniments for illustrated song slides, an added attraction. From Youngstown, Ohio, they moved to Newcastle, Pennsylvania, and about 1903 opened their first theater in an empty store—a building with a seating capacity for exactly ninety-nine persons. Any more than this would have made the theater subject to local and state fire regulations. Business was good, except when there was a death in the community; then the brothers had to dash over to the funeral parlor with the ninety-nine chairs.

However, the motion picture business was then a precarious one, and the Warners were beset with numerous obstacles. There was no guaranty of film delivery. Sometimes it was necessary to improvise a program because delivery was held up, or they had three or four films on hand simultaneously and had to juggle them ingeniously around among the four or five theaters they had acquired, in order to live up to their advance billing. Surveying the situation, Harry Warner conceived the idea of a group of exhibitors and theater owners forming an exchange to facilitate the acquisition and showing of films. The result was the Duquesne Amusement Supply Company, the first organization of its kind in the country. It was established in Pittsburgh and, while it won the support of exhibitors throughout the region, it was short-lived. The producers, discovering that the exchange company was making more money on their products than they were, did everything in their power to discourage the project: they raised the rental rates, delivered poor prints, and often included unwanted or unordered films. The Warner brothers continued the company until 1912, then sold out to the General Film Company. The result of this exchange idea convinced the Warners that if they were to be sure of having pictures to distribute, they must make them themselves. They gathered in New York and began turning out what the trade came to know as "Warner Features" at the old Vitagraph studios. Then in 1917 Ambassador James W. Gerard published his book *My Four Years in Germany.* Aware of the possibilities in it for an excellent movie, Harry Warner secured the rights by offering Gerard a share in the prospective profits. The resulting film grossed almost a million dollars—and the Warner brothers were "on their way."

A few years before the beginning of the First World War, Jack Warner had established a studio in Santa Paula, California, but this production unit was discontinued in 1914. In 1918, however, the Warners again shifted their production headquarters to California. This time they built their studio, a larger one, on Sunset Boulevard in Hollywood, where a number of years later they were to pioneer with talking pictures.

In 1923, although they were incorporated now as the Warner Brothers Pictures, Inc., they were still selling their pictures through franchise holders—powerful independent distributors who advanced them money to make their pictures, but not enough. It was obvious that the solution to the problem would be to control their own distribution network. In 1925 the financier Waddill Catchings met the brothers and, impressed by their business sense and frugal private lives, helped them to raise eight hundred thousand dollars. With this they were able to purchase the Vitagraph Company, which had a nationwide system of exchanges. That freed them from the independent franchise holders. By 1928 they were a sixteen-million-dollar corporation, and within two more years they were worth two hundred and thirty million. This was something unheard of then, even in the movie industry.

During this period the brothers had secured the services of John Barrymore, Lenore Ulric, Ernst Lubitsch, and the great animal star, the dog Rin-Tin-Tin. They had also added to their equipment an invention which united speech with the action in a picture, Vitaphone synchronization. The idea of using sound had started when Sam persuaded Harry to listen to a device the Bell Laboratories had invented and which other studios had turned down. Harry was impressed, and Sam, assisted by the telephone company engineers, conducted the work which made the device practical for motion pictures.

In the summer of 1926 the first Vitaphone picture was released—a John Barrymore vehicle entitled *Don Juan.* Although the voices of Barrymore and the rest of the cast were not recorded, the picture contained a full synchronized musical score by the New York Philharmonic Orchestra. It was soon followed by other Warner films, each offering opportunity for improvement in the sound track. With the release of Al Jolson's '40 *The Jazz Singer* in the fall of 1927, the once wary competitors began to realize that talking pictures were here to stay. This film was the official debut of modern movie history because Jolson's voice was heard—the first time spoken dialogue had been used in a feature picture, for the singing voice had been recorded. But in making *The Jazz Singer* Jolson, by accident before launching into his song "Blue Skies," had said, "Come on, Ma, listen to this." The line was left in, once it was recorded, along with his singing, and the audience was electrified. A new, living, breathing medium of entertainment had come into being.

HARRY M. WARNER

But for the Warners the joy of accomplishment was marred by bereavement: the day before the showing Sam Warner died. The weeks of work and worry had taken their toll, a cold he had contracted had developed into a fatal case of pneumonia. The brothers, although cheered by their success, could not forget the price paid by one of them in making it possible, and they sailed for Europe for a rest. Fate, however, played into their hands. During their absence members of the staff decided that the material in a short then in production, *Lights of New York,* warranted development into a full-length film. They added additional scenes and dialogue to the script and managed to wheedle more funds than the original budget had provided. When the Warner brothers returned from Europe they found that they owned the first all-talking motion picture ever made. Costing forty thousand dollars, it grossed more than two million.

Realizing the head start it had on the others in the film industry, the company proceeded to press its advantage. It brought "big names" to the screen—George Arliss, Leslie Howard, Paul Muni '44, Edward G. Robinson, James Cagney '42—and it devoted the new medium to entertainment of a sort hitherto unknown to film audiences. Warner's produced *Kismet* (1930), *Little Caesar* (1930), *Five Star Final* (1931), *I Am a Fugitive From a Chain Gang* (1932), and many other pictures. The acquisition of the Stanley Company of America, which controlled some two hundred and fifty motion picture houses and also owned a third of First National Pictures, a top-notch studio, put Warner Brothers once and for all on its financial feet. These theaters were a guaranteed outlet for its pictures, no small item when other producer-distributor groups were

JACK L. WARNER

keeping competitors out of the houses they controlled.

By selling their share of the company's stock, plus debentures and common stock, the brothers acquired a chain of some five hundred theaters. Harry bought out the balance of shareholders of First National (its studio became the present home of Warner's, the largest producing unit anywhere); bought up radio companies, music publishers, foreign sound patents; and "raided" other studios for such stars as William Powell, Ruth Chatterton, and Kay Francis, whose contracts were limited only by their agents' imaginations. In short, the Warner company was a "big-timer" now and was able to hold its own. It set the pace in the field of musicals with the lavish *Gold Digger* series. It established an unequaled reputation for the production of "headline pictures" built around the most important news stories of the day—pictures like *G-Men* (1935), *China Clipper* (1936), and *Marked Woman* (1937). It made "spectacles," too—*A Midsummer Night's Dream* (1935), *Anthony Adverse* (1936), *Green Pastures* (1936), *The Adventures of Robin Hood* (1938).

For years, too, Warner Brothers has considered the screen a medium for presenting social issues of contemporary concern. Through such pictures as *Black Fury* (1935), which dealt with labor problems in the mines, *The Story of Louis Pasteur* (1935), *The Black Legion* (1936), which involved racial and religious bigotry, and *The Life of Emile Zola* (1937), Warner's has maintained a high record in film artistry and proved that educative films can be entertaining—and a box office success.

As a film corporation Warner Brothers has had its share of problems, too. There have been theatrical union strikes; charges of monopoly on the part of independent theater owners; salary and contract feuds with some of the leading stars; and, in December 1944, a break with the association Motion Picture Producers and Distributors of America, attributed to dissatisfaction with the Association's handling of labor relations and wage negotiations with the A.F. of L. Screen Actors Guild. Six months after its notification of withdrawal, Warner Brothers Pictures resigned from the M.P.D.A. (June 1945), of which Will H. Hays['43] was then president. By September Hays had been succeeded by Eric A. Johnston['43], former president of the States Chamber of Commerce of the United States of America. About two months later, the bitter eight-month strike of from three to seven thousand employees of various Hollywood studios (in which the Warner studio had been the scene of clashes) was settled. The agreement was reached between the A. F. of L., Johnston, and Donald M. Nelson['41], president of the Independent Motion Picture Producers. Following this, in early November, Warner's was again a member of M.P.D.A.

In the face of growing reports in film trade circles that the American public was becoming bored with pictures concerning the war, Harry M. Warner was the first producer to make a definite statement on the course the motion picture industry in the United States should take during the war. "This is a time for the movies to tell the public what it is fighting for and about," he said in May 1943. "If we fail to recognize this obligation to inform as well as entertain, there would be little justification for our existence." Jack Warner later reiterated: "Obviously the screen is able to reach millions who cannot be reached by any other means," he wrote, at the same time emphasizing a few of the vital services the screen has and will be able to contribute towards the maintenance of peace by "the exposure of the sinister aims and ruthless methods . . . of totalitarianism . . . the promotion of international amity through honest . . . sympathetic presentation of the peoples of the United Nations to each other. . . .These purposes we have sought to serve," Warner continued, "through the production of entertainment which serves simultaneously the not inconsiderate function of bolstering public morale throughout the free world."

After the start of the Second World War, in an attempt to keep audiences abreast of events, Warner's produced such films as Lilian Hellman's['41] *Watch on the Rhine* (1943), *Destination Tokyo* (1943), Irving Berlin's['42] *This Is the Army* (1943), *Casablanca* (1942). (Shortly before the war it made a series of patriotic shorts, "preparing America for the crisis ahead.") In its "win-the-war" effort, Warner's produced films that were rewarded with eight "Oscars" for the year 1944—the gold statuettes awarded annually by the Hollywood Academy of Motion Picture Arts and Sciences. In the case of Warner's the awards were for the best film of the year, best actor, best director, the two best screenplays, best musical scoring, best film editing, and best produced—*Princess O'Rourke, Air Force, Casablanca, Watch on the Rhine,* and *This Is the Army* winning the awards. (Harry Warner had announced that it was not the ambition of the studio to make the best musical film in a war year.) Before the statuettes were awarded the entire proceeds from *This Is the Army*—totaling some ten million dollars —had been turned over to the Army War Relief. In December 1944 the film *Hollywood Canteen* was released. A large portion of the profits from the picture went directly to the real canteen.

Among the most popular of Warner's 1945 releases were the war pictures *Objective—Burma, Hotel Berlin, God Is My Co-Pilot,* and *Confidential Agent*; the comedies *Roughly Speaking* and *Christmas in Connecticut*; the dramas *To Have and Have Not* (with Bogart and Bacall), *The Corn Is Green* (with Bette Davis), and *Mildred Pierce* (with Joan Crawford); and the picture based on the life of George Gershwin, *Rhapsody in Blue.* The company in the same year acquired the rights to the Broadway successes *Life with Father* and *The Voice of the Turtle,* and for the best seller, *The Fountainhead,* by Ayn Rand. Altogether, announced Jack Warner in December 1945, forty-six new feature films were on the Warner program for the coming year.

It is reported that Warner's is planning to collaborate with other major companies in the production of educational films, which will deal largely with social and political issues. During the war, on a nonprofit basis it made many training films for the armed forces, and also short subjects for the Government. For its efforts in the past Warner Brothers received the annual award of the New York Teacher's Union in April 1944. The president of the union, in announcing the award, pointed to the excellent record of "distinguished contributions to the education of America," through Warner Brothers' ability to combine good citizenship with good picture-making. Special mention was also made of the educational bureau recently established by Warner under the direction of Charles S. Steinberg.

Something about the future production policies of the three brothers may be gathered from a statement made by Jack Warner at a studio meeting in December. He emphasized the need for "reconverting the products of the mind as well as the factories" in the direction of a lasting peace. He said that the motion pictures (which his brother Harry had two days before declared as coming "as close to being a universal language as we are likely to get in our time")) "have an implicit responsibility in the prevention of future wars by demonstrating democratic ways of life among peoples, in small groups as well as in national groups. Honest exchange of information and ideas is the primary function of motion pictures as well as of newspapers and the radio." In conclusion he stated that his company would continue its policy of blending entertainment with information.

Harry Warner, the president, is a short, wiry, gray-haired man, and, it is said, he has a vague resemblance to George Arliss. He is said to be a worrier, constantly preoccupied with his own thoughts, and he often fits that Hollywood definition of a producer: a man who asks a question, gives the answer, then tells the other person he's wrong. "Nothing about his appearance, manners, habits, or conversation," says one writer, on the other hand, "suggests a motion picture magnate. In a crowd he would pass for a retired businessman living on a modest income." He has never forgotten that he started at the bottom, and that it was hard work, an iron will, and courage which account for his success. Harry has been the head of the Warner household since its earliest days. According to *Fortune,* that responsibility having been relaxed a little, he is now merely the court of appeals, or trouble department. "They never bring anything to me," he explains, "until it's already wrong." In addition to "managing" the family, Harry has the role of the undisputed boss of Warner Brothers, Inc., and he is regarded as one of the most influential men in the motion picture industry. He has been married since August 1907 to Rea Levinson, which he considers quite a record in Hollywood. They have three children, Lewis, who died when he was twenty-one, Doris Ruth, and Betty.

Albert Warner, treasurer and head of sales and distribution, is often referred to as "honest Abe." Harry claims that Albert is the most popular man in the movie industry, while he (Harry) is probably the most disliked. Albert is not so active in the industry as he used to be, but he is still addressed as Major Albert Warner, a rank given to him by the Army during the First World War for his propaganda work. Abe likes to think of Warner Brothers as the "Ford of the Movies," since Warner films lead in the low-cost field, the profit to the company being due to volume of sales rather than to an occasional smash hit. Of Albert's personal life, little is known. He seldom appears in public, leaving statements of company policy to Harry and Jack.

Jack, vice-president in charge of Warner Brothers' production, is the youngest of the brothers. Like Harry, he looks upon the movie industry as any other kind of factory production, requiring discipline and order rather than temperament and talent. He "personally supervises selection of story material, the assignment and over-all guidance of producers and directors, the discovery and assignment of acting talent as well as the general supervision of all production details. Every device to effect economy is used: repeated use of material, preassembled sets, anticipation of future needs, and a minimum of wasted time and space. However, Jack's real economy consists of the way in which he handles talent and ideas—the really expensive ingredients of a movie, according to *Fortune.* Nor is he blind to the merit of providing opportunities for new directorial talent, and he has faith in his system of creating opportunities for young men. *Princess O'Rourke* (1943), *Watch on the Rhine,* and *Destination Tokyo* were all "firsts" for three young directors. Jack also is aware that roles must be cast on the basis of suitability of the players, and has not hesitated to employ outside talent. Such stars as Cary Grant['41], Ingrid Bergman['40], Robert Cummings, Miriam Hopkins, Michele Morgan, Philip Dorn, Paul Lukas['42], C. Aubrey Smith['44], and Fredric March['43] were engaged from other studios to play those parts which Warner Brothers felt they alone were suited to fill.

However, Jack has not confined his interest to the immediate problems of production. He and Harry have spent much time studying and expounding the future possibilities and obligations of the screen. In August 1944 the Canadian Government presented Warner Brothers with a plaque as an expression of appreciation for the film *The Shining Future,* which

WARNER, ALBERT; WARNER, HARRY M.; and WARNER, JACK L.—*Cont.*

Warner produced for use in Canada's Sixth War Loan. In his acceptance speech Jack declared that after the war "motion pictures must have the same freedom of expression as is guaranteed to the press and the spoken word." Later Jack called for representation of the film industry at the peace conference "because of the increasingly important role the screen will be required to play in the postwar world." He spoke, also, of the necessity for authenticity in foreign themes. "People in other countries will want to see their own modes and customs accurately portrayed . . . and they will no longer be willing to accept an American version of an Englishman, Frenchman, or Russian." In October Jack warned both producers and theater owners against making the mistake of offering "cheaper pictures" during the readjustment period. He stated that the industry had educated the public to expect better pictures and that it was the producers' and exhibitors' duty to supply them.

Immediately after the United States entered the war Jack offered his services to the Army. He was commissioned a lieutenant colonel in the Air Forces. Then, after a year of duty, he was placed on the inactive list; this permitted him to devote his time to the war work the studio was doing. His son Jack, formerly associate producer for Warner's, also served as an officer in the Army during the war. In June 1944 the last Liberty ship from the Richmond Shipyard in California was named *Benjamin Warner* in honor of the brothers' father.

WATSON-WATT, SIR ROBERT (ALEXANDER) Apr. 13, 1892- Physicist; British Government official

Address: b. c/o Air Ministry, London; h. 287 Sheen Lane, London

The man acclaimed in Britain as the developer of the radiolocator, the British equivalent of the American radar, is Sir Robert Watson-Watt, who is regarded by many as the hero of the Battle of Britain. His radiolocator, produced and operated in secrecy, was probably the most effective defense mechanism against the overwhelming air strength of the Germans during the grim months of 1940. When the Luftwaffe flew over the island daily to drop cargoes of bombs, it was radiolocation that enabled the then outnumbered RAF to concentrate its forces at the proper time and place to meet the enemy. It was radiolocation, too, that directed the antiaircraft fire and planes accurately and effectively through darkness and fog. Without the aid of this device, Britain, it is believed, might not have emerged unconquered from that early battle. Sir Stafford Cripps '40 has said of radiolocation: "It contributed to the winning of the war more than any other single factor."

Robert Alexander Watson-Watt was born in Brechin, Scotland, on April 13, 1892, to Patrick and Mary (Matthew) Watson Watt. He received most of his education in schools near his home, going from Brechin High School to University College, Dundee, a college of the University of St. Andrews. He was graduated from University College with a B.Sc., with special honors in electrical engineering. Later he was awarded the honorary degrees of LL.D. by St. Andrews (1943) and D.Sc. by the University of Toronto.

The twenty-year-old engineer began his career in 1912 as assistant professor of physics at his alma mater, University College. Four years later he met and was married to Margaret Robertson, one of the students at the college. In 1915 he was appointed to the first of his many civil service posts as Senior. From 1917 until 1921 he held the position of meteorologist-in-charge at the Royal Aircraft Establishment. It was while employed as a weatherman that he patented his first radiolocation device, in 1919—a contrivance "useful for meteorological purposes such as the location of atmospheric discharges." In the years that followed Watson-Watt concentrated more intensely on radio research, receiving fourteen patents for improved radio direction finders, more sensitive and accurate than the first. (The theoretical findings of Sir Edward Appleton '45 on the reflecting layers of the atmosphere formed a basis for his work in this field.)

In 1921 Watson-Watt became superintendent of the radio research stations of the Government's Department of Scientific and Industrial Research. From 1933 to 1936 he was superintendent of the radio department of the National Physical Laboratory. Then, on April 2, 1935, the Scotsman received his eleventh patent relating to wireless direction and position—a landmark in the history of the radiolocator. For months before he had been carrying on experiments in an old truck parked on a country lane near Daventry, with an RAF plane flying overhead constantly. He had been working on a new type of radiolocator, an instrument which could detect the approach of the flying plane and follow it on its course of flight. This was the real birth of radiolocation, the secret weapon of the Battle of Britain. (Similar work was carried on in the United States by Dr. A. Hoyt Taylor '45.) The first radiolocator was crude, but Watson-Watt and his associates worked on it constantly, and within a year he was granted three new patents. The improvements intensified the sensitivity of the radiolocator, provided it with one device for checking its accuracy and another for increasing the visibility of the warning signals. During the years between 1936 and 1938 Watson-Watt was superintendent of the Bawdsey Research Station of the Air Ministry, where he led the intensive study of radiolocation that was being carried on in Britain.

In 1937 the radio engineer's research took him away from the laboratory into what might be termed "field work." At this time, when the British radiolocation researchers were preparing the first large-scale trial of their devices, there had been a report about a place in East Prussia that appeared dangerously similar to the British radar experimental station at Bawdsey. Watson-Watt and his wife were sent to Germany to investigate the rumor and to observe, if they could, to what extent the Germans had progressed in the field of radar. They traveled as ordinary English tourists, equipped with the familiar walking shoes and Baedeker—plus a pocket telescope which appeared to be a flashlight. They visited many ancient churches, observing the views from the steeples. Mrs. Watson-Watt sketched the landscapes while her husband hunted about in old churchyards for signs of a radar station—signs he would have been quick to recognize since he had personally taken part in the construction of every radiolocation station in England. (The events of the next few years proved that Germany had lagged far behind the Allies in the development of radar. Flushed with their early victories in the war, the Nazis abandoned the study of radiolocation, and later, when they needed it, found themselves two years behind the Allies in their development—a gap not easy to bridge in the realm of science.)

A year before the outbreak of the Second World War Watson-Watt was made director of the Communications Development of the Air Ministry. After 1939 he was appointed to, and still holds, the posts of scientific adviser on telecommunications to the Air Ministry (1940) and vice-controller of Communications Equipment in the Ministry of Aircraft Production (1942). He is also deputy chairman of the Radio Board of the War Cabinet. In 1941 Watson-Watt was sent to the United States to consult with United States Army and Air Force chiefs and to reveal to them the full extent of British discoveries in the field of radiolocation. American scientists A. Hoyt Taylor '45 and Leo C. Young had developed a device based on the same principles as Watson-Watt's radiolocator, but from that time radar, as the device was officially renamed, became a joint project of the United States and Great Britain.

British Official Photo.

SIR ROBERT WATSON-WATT

Sir Robert's lectures and writings have been in the fields of meteorology and radio engineering. In collaboration with J. F. Herd and L. H. Bainbridge Bell he wrote *Application of the Cathode Ray Oscillograph in Radio Research*, showing the value of the cathode tube, which is used in television receivers and in radar, for research into the behavior of radio waves. In 1935 he collected a series of broadcasts into book form under the title of *Through the Weather House*, in which he presented much technical information about weather for popular consumption.

Described as a genial, modest Scot who looks younger than he is, spectacled Sir Robert has a reputation among his associates for his habits of hard work and little relaxation. He has been honored several times by his country for his scientific achievements. In the New Year's Honors of 1941 he was made a Companion of the Bath, and in March of the same year was elected to Fellowship by the Royal Society for his "contribution to radio engineering, particularly in relation to aerial and marine navigation." He was knighted at the King's birthday celebration the next year. As president of the Association of Scientific Workers, he has always advocated the employment of women in science and industry. His wife has assisted him with many of his important experiments, and early in the war he trained three of his WAAF typists as one of the first radiolocation crews.

WATT, ROBERT J. July 16, 1894- Labor leader; United States Government official

Address: b. c/o A.F. of L. Bldg., Washington, D.C.; h. 1421 Massachusetts Ave., Washington, D.C.

The workers' delegate from the American Federation of Labor to meetings of the International Labor Organization, Robert J. Watt has for many years been an outstanding labor union man in the United States. President Roosevelt '42 appointed him the sole workers' delegate to the I.L.O. meeting in Philadelphia in 1944, and in February 1945 he attended the meeting of the International Federation of Trade Unions in London. In 1942 he was made an alternate on the National War Labor Board.[4]

ROBERT J. WATT

An immigrant who came to the United States at the age of eighteen, Robert J. Watt was born in Scotland, July 16, 1894. "I was one of twelve children [of Alexander and Helen (Robertson) Watt]," he says, "and the passing of my father when I was a boy left my mother with seven children under her wing." Since the boy was compelled to go to work when his father died, his schooling did not go beyond the sixth grade. For four years young Watt served as an indentured apprentice, learning the trade of painting, paper hanging, and house decorating. At sixteen his apprenticeship was over, and, in his words, he was "all through."

"Landing in the United States on January 1, 1912," he says, "I went to work in a paper mill in Lawrence, Massachusetts, at fifteen cents an hour. For sixty-five hours a week—thirteen hours a night and five nights a week—I drew nine dollars and seventy-five cents." His activities as a labor union member in the United States began in 1915. (He had been an apprentice union member in Scotland.) And two years later he was married to Janet Learmonth; the Watts have two children, Janet and Robert.

When the First World War broke out Watt immediately enlisted as a private in the infantry of the Canadian Army and served for two years. On his return to the United States in 1919, the year he took out his citizenship papers, he became active in the Lawrence Central Labor Union, of which he was president from 1925 to 1930. In 1932 he was elected vice-president of the Massachusetts State Federation of Labor (he remained in office five years); later he became secretary-treasurer of the organization, a post which he held in Boston for nine years. He was also labor member (1936-38) of the Massachusetts Unemployment Commission. During these years he was called "the most influential labor leader in Massachusetts."

Meanwhile, in 1934 America had joined the International Labor Organization. This body, the largest international organization in existence, was established at Geneva in 1919 to investigate labor problems everywhere and to draft model laws for acceptance by member states. Its main objective is to see that reasonable, comparable standards for labor are made the basis for international trade. Every country which is a member of the League of Nations must be a member of it—there are fifty-three members—but the United States, Brazil, and other non-League members also belong to it. Its delegates are representatives of government (two), labor (one), and capital (one).

In the United States the A. F. of L. was to send the worker delegate, a different one each year. (The CIO was not formed until the year after the United States joined the I.L.O.) Since the first two worker representatives knew very little about international labor conditions, the American representation was not very effective. But in 1936 Robert Watt was chosen as the A. F. of L. delegate. He showed immediately such a grasp of international labor affairs at the Geneva meetings that the A. F. of L. made him its permanent delegate to the I.L.O., with headquarters in Washington. His duties took him to Europe for the quarterly I.L.O. meetings from 1936 to 1940. In addition, he was in 1938 the only labor member of a commission appointed by the President to study labor legislation in Britain and Sweden. In 1939 he represented American workers at I.L.O. meetings in Chile and Cuba.

Over the years, in articles and speeches, Robert Watt has stated the position and convictions of organized labor in the United States. "American labor today," he said in 1938, "wants to be recognized as the partner of capital in production, as the customer of capital in distribution, as the majority voice in a political democracy, and as the substantial center of our community life." He said that it should be a responsibility of business to refuse to use sweatshop materials; that unemployment compensation and old-age insurance are legitimate expenses of business, to be regarded, not as a tax, but as a labor cost.

In January 1942 Watt was appointed by President Roosevelt as an alternate on the National War Labor Board. Speaking on the issue of union labor and the war, he said that "the records of the Bureau of Labor Statistics show that during the first three months of 1941, 53 per cent of all strikes were for the purpose of securing union recognition." He criticized the emphasis placed on loss of man-hours resulting from strikes, since losses following injuries in accidents were six times as large. In another speech he called for the establishment of machinery of representation for organized labor, industry, and agriculture that would be invested with responsibility and authority essential for "real defense and security now and after the war. . . .Failure to establish the machinery of economic self-government for labor and industry has been the greatest failure of our Nation." The next year Watt led the A. F. of L. bloc on the Board in denouncing the new wage ceiling program issued under order of President Roosevelt. The order, they declared, was "detrimental to the war effort" and a violation of the "no-strike, no-lockout" agreement. The order would wreck the wage stabilization program, they also charged, and seriously imperil the Board.

In the spring of 1943 Bob Watt expressed himself as pleased with the establishment of friendly relations between labor and the United States Chamber of Commerce. Invited to address it at its annual convention, he said: "Coming to a Chamber of Commerce meeting is an adventure for a labor representative. He is bound to feel a bit like Daniel in the lion's den." The changed attitude of business, he felt, was due "to the spirit of the national chamber as led by its president, Eric A. Johnston '43, who has done more to remove the barriers of suspicion and hostility which used to exist between labor and industry than anyone would have believed possible a few years ago." He saw further evidence of collaboration between labor, business, and other organizations when, at a national conference on postwar problems held early in 1944, such groups as the NAM, the A. F. of L., and the CIO were equally represented. In analyzing the importance of the charter drawn up by this conference Watt said, "The war has developed a progressive wing of American industry which is ready and willing to cooperate with labor in doing a good job for the benefit of the country as a whole." "We stand with management," he continued, "in opposition to Government interference and labor interference in the performance of the task of management."

On the international labor front certain bitter conflicts of opinion developed when the I.L.O. held its 1944 meeting at Philadelphia. The trouble began with conflicting claims of the CIO and the A. F. of L. for representation in the United States delegation. Under the I.L.O. agreement each nation was entitled to only one delegate representing labor; heretofore the United States delegate had always been Robert J. Watt of the A. F. of L. When the A. F. of L. refused the President's pre-convention request that the two American labor groups share the vote, the CIO withdrew its claim for equal representation, and Roosevelt named Watt as the sole representative of the workers. Watt was elected a member of the governing board.

But the Scottish-born labor leader immediately ran into difficulties over the question of labor representation from the Soviet Union. Since 1939 his opinions on the subject of Communism were pretty well known. "I believe Communism can inspire hope only in the most exploited and downtrodden people," he has said. The Russian leaders, according to Watt, "ignored the spiritual needs and human appetites of the individual. They did not realize that man can be happy only as a man, not as a mechanical unit." Although Russia had not been represented at an I.L.O. meeting since her withdrawal from the League of Nations in 1939, she was asked—following Germany's attack upon her in 1941—to return to the I.L.O. But Watt's proposal that "delegates from any nation that did not have a free democratic government and a free responsible trade-union movement be barred" would have automatically prohibited the return of Russia. Later, on a renewed invitation, Russia replied she would join only if the organization were made an agency of the United Nations, indicating through *Izvestia* her disapproval of the invitations extended by the I.L.O. to one or more Fascist nations.

The right of one of these Fascist nations to a seat at the Philadelphia conference was challenged by Vicente Lombardo Toledano, workers' delegate from Mexico, acting as spokesman for the Latin American group. In a debate with him, Watt, as reported by the New York *Post*, implied that the Mexican's anti-Fascist sympathies dated from Hitler's attack on Russia. (According to a New York *Herald Tribune* writer, Paul Tobenkin, Watt considers Toledano a Communist.) Watt said further that if Argentina were ousted because its labor was subject to Government interference, and therefore was not free, there were "certain other countries" to which the same principle might be applied. With a vote of 14 to 3 the I.L.O. labor delegates barred Argentina (American, British, and Australian representatives cast the negative votes). Later the Argentines were seated by vote of the full conference.

The American workers' delegate encountered more opposition and considerable verbal attack when the question arose concerning the kind of administration to be set up by the United Nations for Germany. Watt demanded that freedom of association be restored in Germany as quickly as possible. He said: "As regards the responsibility of the whole German people, I am in something of a quandary. In all humility, I confess that I should find it difficult to hold peoples always responsible for all the crimes committed by their governments. I doubt if peoples differ as greatly from one another as some . . . seem to believe. I do not believe that any people is naturally and inherently cruel." At this Sir Walter Citrine '41, British worker delegate, was aroused: "Would you say that of the Japanese?" After an exchange of words, Watt replied: "I agree that the Japanese are cruel. So are the Germans. But does that mean that peoples are always, under all circumstances, responsible for their governments? . . .If the whole people is responsible, each individual should be punished for the cruelties and the acts of barbarism that have been committted. Speaking for myself, I cannot lightly accept that conclusion."

(Continued next page)

WATT, ROBERT J.—*Continued*

However, all representatives of the British Government and labor at the conference, and the members of the Czech, French, and Norwegian delegations, refused to consider any resolution on the treatment of Germany and other Axis nations with Soviet Russia absent from the conference. By a vote of 9 to 2 a hands-off attitude was adopted, Watt and the Australian worker representative dissenting. Watt, though defeated, made every effort to reopen the issue to reverse the decision.

Later in 1944 the delegate appeared to have won some concession from the International Federation of Trade Unions, which resolved that "the reconstruction of trade-union organizations and restoration of trade-union rights in all countries is one of the first steps toward human liberties and democratic institutions." The conference accepted a plan drafted by American industry for postwar world-wide economic reconversion, reconstruction, and expansion. A committee was appointed to recommend the plan, which had been given Watt's approval, to the United Nations. Recommendations were also made by the conference for an international economic policy designed to promote full employment and better living standards for the workers of all nations; and a resolution was signed by the worker delegates calling for the immediate rescue of victims of the Nazi terror.

Robert Watt was given a place on a committee of nine appointed at the final session of the I.L.O. conference by the governing body to stand ready at all times to present the social viewpoint of the I.L.O. at any international meetings prior to the next international labor conference. The governing body also created a tripartite committee of eighteen to wage a world-wide fight against unemployment in concert with other agencies that have been or are to be set up by the United Nations.

The veteran A. F. of L leader was heard often in connection with various labor issues during 1944-45. At a conference on Inter-American Development, called by representatives of Government and business, Watt and James B. Carey '41 of the CIO were the only two speakers representing labor. In his speech Watt said that the success of international cooperation and collective security would depend upon the ability of labor to participate with management in evolving economic democracy and keeping it free from political control. He was named chairman of the press committee at the May meeting of the National Post-War Conference. He said that the first meeting, held in February, had shown that diverse interests could get together in "recognition of their joint responsibility to establish a postwar economy of plenty and prevent mass unemployment." Referring to the Montgomery Ward case, he said that "it is utterly wrong to have to go to the President with a labor controversy"—the first union leader to state this opinion publicly. During the 1944 Presidential campaign Watt, viewing the activities of the PAC of the CIO, said that "in every instance where the labor movement has become a front for a political party, it has eventually died." He said it was difficult to keep the wage question out of politics; but noted that in the drive to smash the "Little Steel" formula, labor organizations friendly to Roosevelt's re-election were "unanimously opposed to this Administration policy, while it was being defended by industrialists presumably opposed to a fourth term."

A leader in labor's dissatisfaction with existing legislation for returning war veterans, Watt said that the re-employment provisions of the Selective Service Act were glaringly deficient. He stated that the problem of providing steady jobs at decent wages and good conditions for returning servicemen could be solved only if industrial and commercial activity could be maintained at a rate that would provide such jobs for all who wanted to work. "It will take more than a GI Bill of Rights to do the job." He decried a program set up to discharge a debt owed to servicemen, while "at the same time legislation to meet readjustment needs of industrial workers has been just as promptly defeated. We hope the program will not divide the Nation into mutually antagonistic classes each seeking privileges at the expense of others."

As a member of the Federal Advisory Board for Vocational Education, Watt has suggested utilizing the specialized program of the armed services in developing a broader project relative to the requirements of trade and industry. The vocational schools, he said, should have the active aid and advice of representatives of labor, industry, agriculture, and other organizations in "training the citizens of tomorrow." In an article, "Responsibilities of Vocational Education" (*Education for Victory*, February 3, 1944), he also wrote that "public vocational schools under the framework of Federal cooperation should be at the foundation of the proposed program of vocational training for servicemen."

In January 1945 Watt went to London to attend the meeting of the governing board of the I.L.O. Its object was to discuss the future relationship of the organization with the projected world peace organization. The next month he attended the meeting of the International Federation of Trade Unions. Led by the A. F. of L. representative, the general council of the Federation refused to go on record as favoring a change in the constitution to permit the entrance of the CIO and the Soviet trade unions.

Close on the heels of the I.F.T.U. meeting came a conference called by Sir Walter Citrine, president of I.F.T.U., for the formation of a new World Labor Congress to meet in San Francisco simultaneously with the United Nations conference in April 1945. To it came two hundred and forty delegates from thirty-eight Allied nations and several neutral countries. Russia was among those represented—by a group of thirty-five delegates. The CIO, headed by Sidney Hillman '40, was represented by more than a dozen delegates; but Watt, the sole A. F. of L. representative, refused to attend with Russia present, saying that, as the A. F. of L. has consistently maintained, "the labor unions in Soviet Russia are not free trade unions, but are dominated by the Kremlin." The new World Labor Congress asked for direct representation on the economic and social council of the San Francisco conference; but here again Watt disagreed, saying: "I believe the major social and economic agency . . . should be the I.L.O., through which for twenty-five years governments, employers, and workers have successfully endeavored to define standards and improve conditions of labor." President Truman ['45] reappointed Watt as labor's delegate to the I.L.O. conference held in Paris in October 1945. The attempt of four Argentine delegates to take their seats in this convention aroused sharp protest from Robert Watt and other delegates.

The Scottish-born labor leader, who for more than thirty years has devoted his life to the cause he believes in, is short in stature, has heavy shoulders and an aggressive chin. During the First World War he weighed only one hundred and seventeen, he says, but a good deal of desk work has added more flesh to his frame, and the pressure of labor problems has put quite a bit of gray in his blond hair. As a writer and speaker, he is considered straightforward, prosaic. Occasionally, however, Watt's language is vivid, as in his comment: "I think we would rather spend large sums of money each year to deliver milk to the Hottentots . . . than to expend tens of thousands of lives periodically delivering explosive eggs to free the Hottentots from aggressor nations."

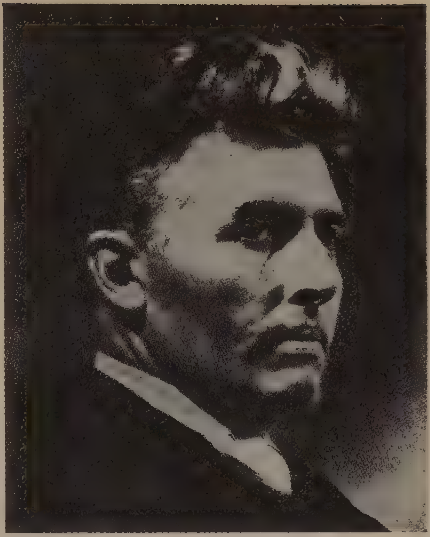
WEBSTER, H(AROLD) T(UCKER)
Sept. 21, 1885- Cartoonist

Address: h. Shippan Point, Stamford, Conn.

The "Mark Twain of cartoonists," H. T. Webster, has been amusing American newspaper readers for over forty years. Creator of comic characters with a broad appeal, his syndicated cartoons enjoy a vast national audience, appearing in the New York *Herald Tribune* and eighty other daily papers. During his long and prolific career his drawings have ranged from militant political cartoons to homely human-interest sketches. His famous creation Caspar Milquetoast, hero of the *Timid Soul* series, has become a nationally known character whose name is a popular term of mild reproach. A Webster cartoon that caused especially favorable comment was titled "Collaborationist." This humorously stabbed at the French method of treating women transgressors during the war. *Newsweek* in December 1944 applauded the cartoon and its creator, stating that fans rate Webster "perhaps the Nation's sharpest and most sophisticated cartoonist."



H. T. WEBSTER

Harold Tucker Webster, son of James Clarence and Fannie Marsh (Tucker) Webster, was born September 21, 1885, in Parkersburg, West Virginia. His boyhood was spent in Tomahawk, Wisconsin, where he grew up happily, fishing and hunting and listening to the discussions of the men who gathered in his father's drugstore. He was "an average student," Webster confesses, "talented at playing hooky."

Throughout his school years from the age of seven, when he first started to draw, the boy made sketches of "everything and everybody." When Frank Holmes started a correspondence school of illustration, young Webster took the course. He studied elementary drawing, perspective, composition, lettering, portraiture, and cartooning. His aim at this time was to be an assignment artist, and he wanted to go to Chicago to study art. During the summers the youth took odd jobs to earn enough money for his art education. He worked in a brickyard, a railroad station, and later drove a delivery wagon for a year, studying and drawing cartoons for the village weekly at night. His first published cartoon, for which he was paid five dollars, appeared in a magazine called *Recreation*. At seventeen Webster had completed his third year of high school and saved one hundred and fifty dollars. With this money he set out for Chicago to attend Frank Holmes's School of Illustration. But twenty days later the school closed.

Webster's next step was to make the rounds of the newspaper offices with his sketches. This search for a job was unsuccessful, but quite unexpectedly he was offered the chance to submit drawings to the Denver *Republican*, although he was to receive no payment for those accepted. The young man, it seems, had sent some of his drawings to an aunt in Denver who, in turn, had showed them to the editor of the paper. Webster saw the offer

WEBSTER, H. T.—*Continued*

as an opportunity to get something in print and in 1902 went to Denver. It was an unproductive move, however, for few of his things were actually printed. When a vacancy occurred on the Denver *Post*, he therefore applied and was hired at fifteen dollars a week. Very soon afterward the teen-age Webster resigned: learning that an artist of some reputation was joining the staff, he had felt sensitive about his own inexperience.

He returned to Chicago and again applied at the editorial offices of the newspapers without success. When his funds ran low he decided to go to Milwaukee to find a job. But again his efforts were futile, and before long he was back in Chicago. After his return he wrote and illustrated some jokes which were accepted by the Chicago *Daily News* and the Chicago *American*; and he sold cartoons to both papers regularly for several months. Then he went home for a rest. While there he accepted an offer from the Chicago *Daily News* and was soon working for that paper at seven dollars a week. He held a job there as comic artist for two years (1903-05), until he was earning twenty dollars a week. In those days his heroes were John T. McCutcheon, George Ade, and Charles Dana Gibson—Webster confesses that he once aspired to be Gibson's office boy.

In 1905 Webster joined the staff of the Chicago *Inter-Ocean* at the "phenomenal" salary of thirty dollars a week to draw front-page political cartoons. Of the subsequent three-year period with the paper Webster remarks: "Two noteworthy events occurred while I was drawing political cartoons for the *Inter-Ocean*. One of them was when a reporter came in and told the editor that a man had laughed so hard at one of my cartoons while riding on the Elgin Electric that he had suffered a stroke and had to be carried off the train in a dangerous condition. The second was when a member of the State legislature waved one of my cartoons before the House and introduced a bill making it a crime for cartoonists to ridicule that solemn and august body."

When a friend urged Webster to take a job with the Cincinnati *Post* the cartoonist could not resist the salary—seventy dollars a week. Although on this job Webster was kept busy drawing political cartoons, it was here that he first began to draw his human-interest sketches. From this period dates the series *Little Tragedies of Childhood*, which was the forerunner of another of his famous series, *Life's Darkest Moment*. It was also during his days at the *Post* that the "infamous M. Huc du Boisdieu hoax" was perpetrated. This incident involved an imaginary French cartoonist whom Webster and his editor invented to supply cartoons during Webster's vacation. The *Post* published accounts of the Frenchman's arrival in the States; Webster's face, disguised with whiskers, appeared in news photos; and the nonexistent M. du Boisdieu, registered at a local hotel, mystified everyone by always being out when callers came. The hoax was later exposed, Webster reports, to the embarrassment of those who had declared they had really met the foreign visitor.

In 1911 Webster fulfilled an old desire by taking a trip around the world. The artist visited Italy, the Near East, China, and Japan. Back in the United States, he was determined to try his luck in New York. On his first night in that city he took a political cartoon to the New York *World*, which was used the following day. The Associated Newspapers signed Webster on a year's contract, with the result that once again he was drawing political "editorials." But now he was more interested in drawing sketches of everyday life; he began to believe that he could accomplish more by depicting the minor events and details that fill people's lives. Gradually then, more and more of his human-interest sketches were used; newspaper readers began to demand "more boys and dogs and funny husbands."

Finally, in 1915, Webster's first book of collected cartoons, *Our Boyhood Thrills and Other Cartoons*, was published, and two years later came *Boys and Folks*. Four years later Webster joined the staff of the New York *Tribune*, where he remained until he changed to the New York *World* in 1923. When Webster and his wife (who was Ethel Worts when they were married in 1916) wanted to spend some time in Europe in 1927, the artist undertook to draw enough cartoons in one month for his paper to use for three and a half months. While working at this task his right hand, his drawing hand, began to hurt, but he continued to draw. On his return from Europe the hand still pained him, and the doctors pronounced the affliction writer's cramp. Webster tried every known remedy, but the paralysis continued. In spite of the pain, the cartoonist delivered his drawings regularly. Undiscouraged, every day he would practice drawing with his left hand. Finally, after four months he triumphed—he was able to do his cartoons as well with his left hand as he had with his right, although he could not and still cannot write with that hand. A few years after this experience, in 1931, Webster began his present association with the New York *Herald Tribune*.

As "America's most talented producer of newspaper comics for adults," Webster has created several series, including *The Thrill That Comes Once in a Lifetime*, *The Boy Who Made Good*, *They Don't Speak Our Language*, *How To Torture Your Wife*, and *Poker Portraits*. The inspiration for his work has been the small dramas of daily life and he has very often drawn from his own childhood memories. His humorous contemplation of life and human nature has earned him a leading place among nationally recognized cartoonists. Bridge and poker players are delighted by Webster's cartoons on their games: he has published several collections—*Webster's Bridge* (1924), *Webster's Poker Book* (1925), and the *Culbertson Webster Contract System* (1932). His book *The Timid Soul* was published in 1931, and met warm critical approval. (Its introduction is by Ring Lardner.) The New York *Times* commended the book for its delineation of human nature and remarked that Webster "catches virtually all of humanity at one time or another in its most spineless moments." Discussing the origin of the hero Caspar Milquetoast, Webster remarked that the well known character "slipped into the world almost unnoticed, apologetically, you might say." The cartoonist created Caspar to fill space in the New York *World,* and it was several days after his initial appearance that Webster decided to keep him. In his latest series, *The Unseen Audience,* Webster has sharpened his pencil in behalf of long-suffering radio listeners afflicted with inescapable, too-oft-repeated commercials.

Webster wrote a diverting article which appeared in *Forum* (December 1933) on his series *They Don't Speak Our Language.* In his discussion of this series Webster revealed that it was directly inspired by a conversation he overheard in which two young girls talked in a language beyond his comprehension. The article proceeds to illustrate the caste marks of speech, offering amusing examples of the jargon of the underworld, the stage, and of Webster's favorite argot, circus talk. The humorous vein of the discussion reinforces the cartoonist's claim that language is kept vital by corruptions, vulgarisms, and slang, that new situations and objects constantly require new words and phrases.

Webster's most famous cartoon was first published in 1918, on Lincoln's Birthday, and it is still reprinted by newspapers on the anniversary. Entitled "Hardin County—1809," it shows two old farmers who have met on the road exchanging the following remarks:

"Any news down t' th' village, Ezry?"

"Well, Squire McLean's gone t' Washington t' see Madison swore in, an' ol' Spellman tells me this Bonaparte fella has captured most o' Spain. What's new out here, neighbor?"

"Nuthin' a tall, nuthin' a tall, 'cept fer a new baby down't Tom Lincoln's. Nuthin' ever happens out here."

Jerome Beatty reports that Webster's own favorite cartoon is one of Caspar Milquetoast, The Timid Soul. It shows Caspar "standing on a street corner in a drenching rain without an umbrella, his collar turned up, hands in his pockets, clothes soaked, and water trickling down his neck. Pedestrians in raincoats and rubbers, carrying umbrellas, splash briskly past, but Caspar stands there shivering. Finally, however, he declares, 'Well, I'll wait one more hour for him and if he doesn't come then he can go and borrow that one hundred dollars from somebody else.'"

In 1945 two series of cartoons by Webster were published in book form, *Webster Unabridged* and *To Hell With Fishing.* C. V. Terry wrote in the New York *Times Book Review* that "he who has yet to make the acquaintance of H. T. Webster has only himself to blame: faced with two new cartoon anthologies by that acerb (but always kindly) commentator on human foibles, the critic can only pass the word along." "To add anything to the tributes which the cartoons of H. T. Webster have garnered through the years would be carrying Newcastle to coal," was the comment of Lisle Bell in the New York *Herald Tribune Weekly Book Review.* "Mr. Webster is a beloved fixture of the American scene which he so joyously records."

Webster works about four hours every afternoon and, needless to say, enjoys his work. The cartoonist is six feet three inches tall, has blue eyes, clearly defined features, and a gracious manner. He has described the circumstances of his marriage: "On one important evening in 1916 R. M. Brinkerhoff introduced me to a young lady who was then studying at Columbia University. We went to dinner, and from there, by easy stages, up to the altar. I was very deliberate and cautious about it. It was all of two weeks before I married her." (They were married August 2, 1916.) Webster calls his wife his "severest critic." The Webster home in Connecticut is a replica of a New England farmhouse, and the artist has his own workshop. He is a member of the Society of Illustrators and his clubs are Dutch Treat, Players, and Coffee House. The artist likes the games he depicts so humorously —they are bridge and poker. Nowadays he restricts himself to bridge, however, having given up poker after his marriage. An expert fisherman, he frequently goes fly-fishing in one of the Maine lakes, where he owns an island. He has many fond recollections of his early boyhood, and when he receives letters from children he always answers them. Webster's sympathies are also with the timid soul, the Caspar Milquetoast, who, he insists, is a self-portrait.

WEDEMEYER, ALBERT C(OADY)

(wĕd'ē-mī-ẽr) July 9, 1897- United States Army officer

Address: b. c/o War Department, Washington, D. C.; h. 2118 Wyoming Ave., N.W., Washington, D. C.

Lieutenant General Albert C. Wedemeyer came to the fore in October 1944 as the commanding general of the United States Army Forces in the China theater of war, and Chief of Staff to Generalissimo Chiang Kai-shek ['40], serving in one of the most bitterly divided countries in the world.

Albert Coady Wedemeyer was born in Omaha, Nebraska, on July 9, 1897, the son of Albert Anthony and Margaret Elizabeth (Coady) Wedemeyer. His grandfather had emigrated from Germany, organized a band for the Union Army, and marched it through Georgia; his father was a bandmaster in the Spanish-American War. Albert was appointed to the Military Academy at West Point and was graduated in the class of 1918, which finished in a year and a half and was then brought back for six months' "polishing." He was commissioned a second lieutenant of Infantry on November 1, 1918. Until June 1919 he was stationed at the Academy. He then went to Europe for an observation tour of battlefields in Belgium and France, returning to the United States in September, when he entered the Infantry School at Fort Benning, Georgia. On February 27, 1920, he was promoted to first lieutenant. Upon graduation that June he was assigned to the Twenty-ninth Infantry at Fort Benning, where he remained for two years. At the end of that time Lieutenant Wedemeyer became aide to Brigadier General Paul B. Malone, commandant of the Infantry School. He

U. S. Army Signal Corps
LT. GEN. ALBERT C. WEDEMEYER

accompanied the General to Fort Sill, Oklahoma, in December 1922, and later that month to Fort Sam Houston, Texas, where he remained until September 1923. The Lieutenant then was sent to the Philippines for duty with the Thirty-first Infantry at Manila. In December he was transferred to the Fifty-seventh at Fort McKinley, also in the Islands.

In October 1925 he returned to the United States and was assigned to the Twelfth Infantry at Fort Washington, Maryland. In December 1927 he was assigned as aide to the commanding general of the District of Washington, in which post he remained until 1930. In January of that year he went to Tientsin, China, for duty with the Fifteenth Infantry. While there he studied Mandarin. In March 1932, Wedemeyer was reassigned to the Philippines, as aide to Major General C. E. Kilbourne on Corregidor. In June of the following year, still on that island, he was assigned as aide to Major General Stanley D. Embick, his father-in-law, Wedemeyer having been married to Elizabeth Dade Embick in February 1920 while at Fort Benning. At about this time he became interested in the study of economics, history, foreign affairs, and air power.

Wedemeyer returned to the United States in June 1934 and entered the Command and General Staff School at Fort Leavenworth, Kansas. On August 1, 1935, he was advanced to the rank of captain. Upon graduation from the difficult two-year course in June 1936, he went to Washington, D. C., for a brief tour of duty with the Intelligence Division, G-2, of the War Department General Staff. Because he had graduated with such high honors from the Command and General Staff School, he was chosen to go abroad in July 1936 to continue his studies, becoming the first American officer after the First World War to attend the German General Staff School, the Kriegsakademie. He remained at the German war college until August 1938, and during the two years he had an opportunity to witness the growth of the Nazi war machine. The New York *Sun* says Captain Wedemeyer returned "with a suggestion of the monocled aplomb which distinguishes the best of the German General Staff." Upon his arrival in the States he was assigned once more to the Twenty-ninth Infantry at Fort Benning, Georgia. In January 1940 he was transferred to the Ninety-fourth Antitank Battalion there, serving as executive officer. On July 1 of that year he was promoted to the permanent rank of major, and in September he went to Washington, D. C., to serve in the Training Section of the Office of the Chief of Infantry.

Eight months later Major Wedemeyer became a member of the Plans Group of the War Department General Staff, serving under General Dwight D. Eisenhower '42. On September 15, 1941, he was promoted to the temporary rank of lieutenant colonel, and on February 1, 1942, to colonel (temporary). While with the Plans Division he served as a member of the Joint Strategic Committee and the Combined Subjects Committee, continuing in that assignment when the War Plans Division became the Operations Division in March 1942. In June he became assistant to Major General Thomas Handy, the assistant chief of staff of the Operations Division. On July 7 of that year the Colonel was raised to the temporary rank of brigadier general, and on December 11 his permanent rank was raised to lieutenant colonel. He is regarded as an expert in war plans and during the war went with General Marshall '40 on most of his trips abroad. In February 1943 Wedemeyer represented the United States Chief of Staff at a conference with Chinese and British leaders in the war against Japan.

In 1943 Wedemeyer was awarded the Distinguished Service Medal. The citation for the award reads: "For exceptionally meritorious and distinguished service in a position of great responsibility as chief of the Strategy Section and subsequently as chief of the Strategy and Policy Group, Operations Division, War Department General Staff, and as the War Department representative with the Joint and Combined Staff Planners. By his outstanding ability, resourcefulness, tact, initiative, and profound strategical judgment, he contributed in large measure to the adoption by the United States and by the United Nations of sound strategical plans which have formed the basis for the successful prosecution of the war on all fronts."

In September 1943 Wedemeyer was advanced to the temporary rank of major general, and in October the War Department announced his appointment as American deputy chief of staff of the Southeast Asia Command under Admiral Lord Louis Mountbatten '42, who was said to have been extremely pleased with the selection. In the differences which developed during the following spring between Mountbatten and Stilwell, with regard to the proposed Burma campaign, Wedemeyer was reported to have been a little inclined to agree with the British admiral in his wish to postpone until after the monsoon season the launching of a large-scale campaign to retake Burma. The difficulty of mounting such a campaign, with the prior claims of the European theater on Allied shipping and supplies, was an additional reason in favor of postponement.

At the end of October 1944 it was unexpectedly announced that General Stilwell had been relieved of his command in the China-Burma-India theater in response to a demand from Generalissimo Chiang Kai-shek. The theater was to be divided into two areas, with the forty-seven-year-old Major General Wedemeyer in command of United States Army Forces in the China area (including French Indo-China), and Lieutenant General Daniel I. Sultan '45 in command of the India-Burma theater. Concurrently, Wedemeyer was named chief of staff to Chiang. (In January 1945 Wedemeyer received his promotion to lieutenant general [temporary].) At the same time announcement was made of the resignation of Ambassador Clarence Gauss '41, who, it was believed, had supported Stilwell. According to reports, Chiang and his chief of staff had disagreed on practically every vital issue, including the relative merits of air power versus the combined use of ground and air forces, which Stilwell recommended; the American's attempts to get Chiang to cooperate with the Chinese Communists in the war against Japan; and his desire to modernize the Chinese Army. According to a summary in a New York *Herald Tribune* editorial, indications were that the Chiang dictatorship had been getting increasingly reactionary, autocratic, and inefficient in war—having diverted thousands of its best troops to blockade the Chinese Communist forces in the north, who were putting up the more aggressive battle against the common enemy.

In his first interview with the press, the new American commander in China, faced with these difficult problems, described the military situation as "unfavorable, but not irretrievable," and he made it clear that his job was to serve the Chinese in the war against Japan, that he would not interfere in Chinese politics. By November Wedemeyer was able to report some progress. The plans he had offered to Chiang for disposing of Chinese forces to meet possible Japanese moves in the near future had been accepted. Toward the end of the month long-demanded extensive changes in the Chinese Cabinet were announced. According to a New York *Times* analyst, "taken together, they seemed to point to a more effective conduct of military and political affairs."

Wedemeyer was in an equivocal and difficult position as administrator of an American foreign policy which seemed to many ill-defined and to some, ill-advised. From the military viewpoint, however, his work drew favorable press comment. "General Wedemeyer has improved American aid by installing an improved supervisory system over American equipment and supplies delivered to the Chinese," wrote Henry J. Taylor in June. By insisting on American supervision over the local food purchases with Lend-Lease funds, he is said to have improved the Chinese soldiers' typical diet greatly. He obtained planes from the Joint Chiefs of Staff. "He has increased the quick and effective use of American materials against Japan. . . .He has improved the understanding of China's problems within the Joint Chiefs of Staff and has stayed clear of Chinese politics. He has stuck to Washington's order to support militarily only Chiang Kai-shek," Taylor wrote further. The American troops under Wedemeyer's command were not primarily combat forces, the General said, but were there to train the Chinese ground forces and keep the all-important supply lines open. They did, however, go into action with their pupils "in an advisory capacity"; and in November 1945 he announced that the advisers were withdrawn from all troops engaged in "fratricidal strife."

Left-of-center commentators, notably the newspaper *PM*, charged that instead of Wedemeyer carrying out the orders of the Joint Chiefs of Staff, in many cases they were simply backing up the policies he made on the spot—policies which interfered in the undeclared civil war by giving aid and comfort to one side. The General also found it necessary to explain that the use of American Lend-Lease weapons in factional battles was due to their being stolen or otherwise diverted from their assigned use against the common enemy; but he remained the target of daily attacks in the Communist Chinese press. The relations of his troops with the Chinese population also deteriorated to a low level, Dixie Tighe reported. He finally issued orders forbidding military personnel to engage in outside business activities, because of black market sales by American soldiers. He admitted that some of his men had been drawn into "little isolated clashes" with Communist Army troops, and reported that on certain occasions Americans had been fired upon, although denying that they had ever taken the offensive. Altogether, however, it was pointed out that Wedemeyer had come to China at the low ebb of her Government's morale and military power and had built them both up to effectiveness. After consultations in Washington, he returned to his Chinese duties in the fall of 1945, and it was reported that Chiang looked with favor upon having him head the projected military mission which was to replace the wartime troops in that country.

Handsome General Albert C. Wedemeyer has been described as having a profile suggesting George Washington's. "His high, gray pompadour tops a lean body over six feet. He is quiet, yet friendly; frank, yet modest and unselfseeking"; honest, but shrewd; clever, aggressive, and full of typical American energy. He is an infantryman, but air-minded. Thomas M. Johnson, in an article in the New York *World-Telegram*, says that Wedemeyer would probably be happiest commanding one of the air-borne divisions which he considers the units of the future. He strongly favors triphibious training and helped organize the new Joint Army and Navy Staff College. The General has two sons, Albert Dunbar and Robert Dade. In January 1945 he was honored with the British Order of Commander of the Bath, and in November 1945 he was given the Distinguished Flying Cross for "flying over some of the most rugged terrain in the world, often in treacherous weather, to take an active hand as commander of the China theater."

WESTMORE, PERC (pẽrs) Oct. 29, 1904- Cosmetician; businessman

Address: b. c/o Warner Brothers Studios, Olive Ave., Burbank, Calif.; House of Westmore, Inc., 6638 Sunset Blvd., Hollywood, Calif.; h. 1416 Bluebird Dr., Los Angeles, Calif.

Perhaps the best-known and best-paid make-up artist in the world is Perc Westmore, the president of the House of Westmore, who was chosen by the editors of the *Encyclopædia Britannica* to write the article on motion picture make-up for the current edition. Westmore and three of his brothers have supervised costume and make-up for several film companies. Perc is head of the make-up and hair styling department of Warner '45 Brothers studios, Wally has the same post at Paramount Pictures, Bud is director of make-up and hairdressing for Producers Releasing Corporation Studios; and the three brothers together constitute "The Royal Family of Make-up," whose influence on American standards of beauty and indirectly on economic life was sharply demonstrated in the late thirties. At that time Perc Westmore became annoyed with a certain permanent-wave company and therefore devised a coiffure for his stars which required no wave, the pageboy bob. "I learned my lesson," he says. "Women stayed away from beauty shops all over the country. They didn't have permanent waves. They didn't have anything. They just rolled up their hair and let it go at that. Shops closed up by the score. . . . Anything we do is reflected in other businesses all over the country, wherever pictures are shown. We've learned to remember that."

The make-up trio and their cosmetician brothers Frank and Ernest are the only ones of George Westmore's nineteen children who are living. Perc, who does not reveal the rest of his prenames, was born to Ada Florence (Savage) Westmore on October 29, 1904, in the historic town of Canterbury, England, where his father was a wigmaker. When he was four, the family moved to Canada, where they lived in Montreal and in Toronto. After living in Buffalo, St. Louis, Cleveland, New Orleans (where Bud was born in 1916), San Antonio, Washington, and Pittsburgh, they finally settled in Los Angeles. George Westmore believed that children should learn a trade early, and began teaching Perc wigmaking when the boy was nine. Perc had only four years in two Cleveland schools, and while going to school as well as later he helped his father in the latter's wig shops and salons.

Perc began his career as an apprentice wigmaker in 1916. At fourteen he was employed as a skilled wigmaker. Later, according to the *American Magazine*, the Westmore brothers started out in California as rabbit ranchers, but when the furs failed to bring a fortune, they went back to their father's profession. Perc joined the Maison Cesare in Los Angeles as assistant wigmaker and janitor; while there, he read widely in the fields of skin, hair, and anatomy, and experimented with cosmetology and make-up.

Seventeen-year-old Perc got the chance to make a half-mustache for Adolphe Menjou, who had accidentally shaved his off; and its naturalness so impressed Douglas Fairbanks '40 that he ordered Westmore to remake all the hairpieces for *The Three Musketeers*. Perc and his father worked night and day to fill the order, and the latter was asked to report to the studio each day to put them on the actors, a revolutionary innovation. Inspired, George Westmore began to hold nightly classes for his sons at home in "making ourselves indispensable on sets," and he was the first to put his ideas into practice. However, this work for United Studios in 1921 also led to a job for Perc at the First National Studios. Their close-ups, Westmore recalls, "were always terrible." One day in 1923 or 1925—accounts differ—he suggested that the problem was not one of lighting or of film development, but of make-up. As a result, he was authorized to organize a make-up department, the first of its kind in any studio, and saw to it that the make-up was applied in exactly the same way each day.

After First National was merged into Warner Brothers', "Jack and Harry Warner pioneered the way in supplying the tools and materials for research on a comprehensive scale." In 1929 they consented to Westmore's joining the Max Factor Company as a make-up adviser, while remaining head of their make-up and hair styling department. "Many outstanding and revolutionary improvements in the motion picture industry and the cosmetic and wigmaking fields were the result of his connection with this organization," to quote a House of Westmore release, and he "played an important part in the development of the widespread popularity of the Factor cosmetic line. Probably one of the most impressive contributions of Perc Westmore's to this company was the founding of the Hollywood Art School of Make-up." Among the Westmore innovations is the principle of "corrective make-up," by which "the make-up itself accepts and reflects or rejects [and absorbs] light to retouch the planes of the face, much on the same principle as retouching the proof of a portrait study."

Like any make-up director, Perc Westmore was responsible for various kinds of *maquillage*: to make male players, including such "tough guys" as Humphrey Bogart '42, James Cagney '42, Errol Flynn, George Raft, and Edward G. Robinson, look natural and unmade-up on the screen; to accentuate the best points of actresses like Olivia de Havilland '44, Ann Sheridan, Merle Oberon '41, and Lauren Bacall; to make any player look older or younger; and to transform an actor into some other character, often one of whom the audience already has a clear mental picture—for example, making Bette Davis '41 into Queen Elizabeth for *The Private Lives of Elizabeth and Essex* (1939). Pete Martin, the *Saturday Evening Post* writer, who was made up by Westmore on successive days as Will Rogers, Benjamin Franklin, and Dick Tracy, has given a description of the process involved in the March 11, 1944, issue.

In 1935 Perc, Wally, Bud, and Frank Westmore opened a Hollywood beauty salon which, because of their lack of business sense, threatened to turn out a failure. Realizing this, they hired a businessman, S. Willard Isaacs, owner of a beauty-shop chain, to run it. In 1945 it had a staff of one hundred operators caring for an estimated eight thousand patrons a week. A few years later they put House of Westmore make-up on the market. MGM's Max Factor had long had a line of cosmetics, but whereas Factor's were in the expensive category, Westmore's cosmetics, in a box decorated with a gold coat-of-arms, sold at prices satisfactory to the average buyer. In addition to rouge, lipstick, and face powder, Westmores' original line included a tinted, waterproof foundation cream, which they claim was the first of its kind and is still the largest-selling. Later developments were a liquid cream base, Overglo, and a non-chromatic powder for use with tinted foundation.

Perc Westmore's proudest make-up achievement was transforming Fredric March '43 into Mark Twain; when he walked into the executive lunchroom at his studio with "Twain," everyone present, it is reported, rose in spontaneous applause. This was the expert's last assignment before induction into the Army, which he liked. "Maybe it was because I'd never had time to be a Boy Scout, or to go camping or hunting or anything like that," he has said. "The Army was my Boy Scout camp." After some months, however, Westmore was discharged, because of chronic sinus trouble and an attack of pneumonia. The first picture on which he worked after his return was *Mr. Skeffington* (1944), which he considers his worst job, although he was working on his favorite subject, Bette Davis.

Westmore has given much time to improving the appearance of the disfigured. He and his brother Wally Westmore experimented with artificial jaws, ears, and limbs made of a latex rubber material on which he holds the patent, and which he had been using instead of putty since 1939. By late 1944 they had worked out objects which would last three months under rough handling. Another of Westmore's inventions is the hairlace wig, which is said to be undetectable. Perc Westmore's invention of the hairlace wig and other developments were recognized by the Motion Picture Make-up Artists Association with a scroll of appreciation. (The cosmetician was president of the Association for five years between 1924 and 1931.) In 1936 Westmore wrote a series of syndicated articles on make-up, and he has also lectured and written other articles on the subject. In 1939 he wrote the *Encyclopædia Britannica* article, which he revised in 1945; in 1945, too, he wrote a chapter, "The Principles of Stage Make-up," for the textbook *Navy on Stage*. During the war he made technical short features for the Army and appeared in skits presented at Army camps.

PERC WESTMORE

The head of the House of Westmore is tall, hazel-eyed, olive-skinned, with curly dark hair and a boyish face. He is said to be "volatile and extroverted . . . the reverse of poker-faced." According to the Warners publicity office, he is "roundly (self-)educated, a competent sketcher, a student of anatomy and prosthesis." Westmore has collected a library of rare books on his subject: he points out that the essentials of make-up are the same as those of the ancient Greek masks—upturned lines for cheerfulness, downward lines for gloom—and says that women's brows and lips should therefore have an upward tendency. Perc Westmore has been married four times; his present wife is the former Margaret Donovan, whom he married in May 1943. By earlier marriages he has a grown daughter, Norma Elizabeth, and a younger child, Virginia Paula. The cosmetician, who lives in Beverly Hills, is an amateur cabinetmaker, pointing with especial pride to one doghouse of his making—a miniature Swiss chalet of two stories, connected by a stairway, and complete with cornices and a shingled roof. Because of the danger from his electrically run lathes and saws, Westmore has had his hands insured. His favorite sport is deep-sea fishing.

WHITE, HELEN C(ONSTANCE) Nov. 26, 1896- Educator; author

Address: b. c/o University of Wisconsin, Madison, Wis.; h. 417 Sterling Pl., Madison, Wis.

Through a nationwide mail ballot of its members, the American Association of University Women, largest women's organization in the United States, in June 1945 re-elected to its presidency Helen C. White. Novelist, scholar, and one of a small number of women in the country who are full professors, Miss White places her main interest, as borne out by both her fiction and nonfiction writings, "in the field of the history of ideas."

Helen Constance White was born on November 26, 1896, in New Haven, Connecticut. Reared in the Catholic faith, she is one of several daughters of John and Mary Josephine (King) White. She attended Girls' High School in Boston and Radcliffe College, the woman's branch of Harvard University, in Cambridge, Massachusetts, where she majored in English. In 1916 she received her Bachelor's degree from Radcliffe and was elected to Phi Beta Kappa. The next year, after receiving her Master's degree from Radcliffe, she joined the faculty of Smith College as assistant in English, a post which she held until 1919. Prior to 1919—the year of the promulgation of the Nineteenth Amendment—she had become interested in the woman's suffrage movement during her sophomore year in high school. In 1919 she accepted a position as instructor of English at the University of Wisconsin, where she has taught since, when not spending a leave of absence on research abroad or at home. Always interested as much in research as in teaching, she found time during those first years in the West to study for her Ph.D. degree, and in 1924 the University of Wisconsin conferred that degree upon her. The following year the university promoted her to the position of assistant professor of English. And in 1927 her Ph.D. thesis was published in book form under the title of *The Mysticism of William Blake.*

Miss White's life has been an exceptionally crowded one. She once commented that her teaching schedule included "everything from freshman English to a graduate seminar in the seventeenth century," forgetting at the moment to specify that it also included classes in creative writing. Her general schedule includes, besides her teaching and critical research, novel writing, committee membership, and travel. The year 1928-29 she spent abroad as a Guggenheim Fellow, studying English religious literature of the early seventeenth century at the British Museum and at Oxford's Bodleian Library in England. In the summer of 1930, an additional grant from the Guggenheim Foundation made it possible for her to return to England to check her manuscript which was published in 1931 under the title *English Devotional Literature: Prose 1600-1640.* In 1930 she also served as coeditor with Finley M. K. Foster of a volume of selections of Victorian prose.

The professor-author's first work of fiction, *A Watch in the Night,* appeared in 1933 and was chosen as a book-of-the-month by the Catholic Book Club. It was also the first choice of the Pulitzer Novel Committee, but the General Committee chose *Lamb in His Bosom!* by Caroline Miller because it was laid in an American scene. The novel's conception (it is the story of a thirteenth century Franciscan) dates back to Miss White's vacation in the Umbrian hill country of Italy during her year of study abroad (1928-29), the vacation during which in all probability, says one reviewer, she absorbed much of its background. Critical opinion of the book varied. Though all critics agreed on the novel's amazing richness of detail and luxuriance of language, some approved and some condemned these traits. One reviewer considered *A Watch in the Night* "an entrancingly beautiful narrative, one that has a majestic sweep like a mighty river . . . a story that lives and is vital." Another found the book's greatest asset in that it is "first and last and all the time . . . a story." A third wrote, however: "Miss White's Jacopone is a conventional figure; and the events that convert him from a worldly young lawyer of the Renaissance into a very holy man are also conventional. The appeal in this story is of a nature that would tend to please a simple audience with a taste for melodrama." And the reviewer of *Catholic World,* attempting to evaluate the novel's position in American literature, concluded: "*A Watch in the Night* is an important historical novel, a distinguished piece of literary prose, and, besides, an interesting and vivid story. Were the author successful in her attempt as scholar, artist, and novelist, the volume would have to be classed as indeed a great book. But, in trying to accomplish a feat which means achieving greatness on three levels all at once, Miss White has not reached full measure on any."

In 1935 Miss White—who had now been associate professor of English at the University of Wisconsin for almost two years—published her second novel, *Not Built With Hands,* the story of Pope Gregory VII and Matilda, Countess of Tuscany, during one of the crucial periods in the history of the Roman Catholic Church. It was the philosophical conclusion of this book, says the author, which came first to her mind, the resumption of the "little life of the world . . . when the great who had striven with the mightier issues of existence were defeated and dead." She does not know exactly when she first became interested in Gregory VII, but she remembers that he attracted her in her freshman history course at Radcliffe. As for Matilda, she exercised on Miss White the same attraction as had the suffragettes. Thus slowly the novel was born, to be written during the summer of 1934.

Chosen as a book-of-the-month by the Catholic Book Club, as was its predecessor, *Not Built With Hands* in general received more entirely favorable reviews than *A Watch in the Night,* although Catholic critics failed to agree on the accuracy of its Church history and some commentators felt that the later chapters fell below the narrative standard set by the author. The novel's prose style was praised by nearly all. Pointing out the core of Miss White's literary talent, one reviewer commented: "Helen White's two novels fall outside the customary categories of fiction today . . . [because she deals] with subjects which transcend the usual fictional preoccupations. Her concern is with philosophical, or, if you like, religious significance in the life of man, with the profounder seekings of the human heart. So it is very natural that she should set her conflicts back in those centuries when men and women met their inevitable problems and dealt with them . . . as signs and warnings on a road that should be leading to God."

In the spring of 1935, Miss White was at Harvard University gathering material for another scholarly book, "a critical study," she said before she had decided upon its title, "of the religious thought and feeling of a group of five poets—Donne, Crashaw, Herbert, Vaughan, and Traherne, who are usually known in English literature as the metaphysical poets." A grant from the University of Wisconsin enabled her to complete her researches at the British Museum in the summer of that year. Entitled *The Metaphysical Poets; a Study in Religious Experience,* the book came out in 1936. Critics praised its precise and careful scholarship and deplored or applauded her cautious and unemotional approach to a degree commensurate with their academic leanings. It was in the year this volume was published that Miss White received her third promotion, becoming one of the comparatively few women to hold a full professorship and the only woman full professor in the University of Wisconsin's College of Letters and Science.

In 1939 Miss White's *To the End of the World* was published, a story of the French Revolution as seen through the eyes of a young priest of Cluny Monastery, "who valiantly played his part in maintaining the stability and piety of the Church through the period of the Terror." Critics wrote: "Though the story is somewhat slow moving at first, due to the vast amount of detail involved, and though, in the last chapters, Michel's path may perhaps seem to smooth out too swiftly and easily, the reader is left with an impression of a rich and colorful picture of a gallant struggle," and "Miss White writes with distinction and consideration. Her picture of the time is powerful and convincing, and the great panorama she draws . . . gives a comprehensive view of a churning era. In a way, there is a pageant here, but it is a pageant that serves as a backdrop for the one central character who commands the stage at all times. . . . [This] is a book for those who desire to understand what leveling revolution can do to the ideals enunciated by Jesus Christ."

The year 1939-40 Miss White spent as a Research Fellow at the Henry E. Huntington Library in San Marino, California, studying that institution's collection of popular sixteenth century literature in order to determine whether religion was a socially stabilizing or socially upsetting influence in sixteenth century life. Her conclusions—that there is evidence to support both contentions and that the emphasis seems to be on the stabilizing effects toward the end of the century—were published in 1944 in her latest scholarly treatise *Social Criticism in Popular Religious Literature of the Sixteenth Century.* Reviewers considered the book a work of "impeccable scholarship" and "sureness of vision," one which "the most exacting student of social history may use with confidence" and one which might well be of interest to a wide circle of lay readers.

HELEN C. WHITE

In 1941 Miss White was first elected president of the American Association of University Women, in which she had long been an active member, serving on the Committee on Membership and Maintaining Standards from 1933 to 1938, and on the Committee on Fellowship Awards from 1937 to 1941. As president, Miss White, who was re-elected to the post in 1945, has urged the organization to carry on in the tradition of "practical work in education" which its founders mapped out and to use their college-trained minds to study and investigate all issues before passing judgment or taking action. "In the press of immediate questions," she told a meeting of A.A.U.W. state presidents, "we must not forget that the great problem of the world is the replacement of force as the arbiter of man's destiny. Persuasion by appeal to reason is the essence of that substitute, by whatever name it is called. And the great instrument of persuasion is education, democratic education with its faith in man's reasonableness, with its confidence in man's intellectual and moral freedom."

Helen White has been awarded honorary degrees by Mount St. Scholastica College (LL.D., 1939), Mount Mary College (Litt.D., 1941), and Rockford College (LL.D., 1942). In 1942 she was the sixtieth recipient, and the thirteenth woman recipient, of the Laetare Medal given annually by the University of Notre Dame (Indiana) to an outstanding Catholic layman. For the fall semester of 1943-44 she accepted the invitation of Columbia University to be visiting professor of English in Barnard College. She is a member of the executive council of the Modern Language Association and of the Executive Committee of the American Council on Education, and she was formerly president of the University of Wisconsin Teachers Union and the first woman to become president of Wisconsin's University Club. "Her humor, keen analytical power, and gift for beautiful

WHITE, HELEN C.—*Continued*

expression," announced an A.A.U.W. press release, "have made her much in demand as a speaker."

Miss White enjoys "doing things with people," which accounts for both her teaching and her frequent committee work. But she complains that she has "one of those inconvenient minds that can really take in only one thing at a time" and that "the result is a very jerky tandem effect" and, she is afraid, more than her "due contribution to the saga of the absent-minded professor." She likes to travel, to see architecture, scenery, and people, "just the look and feel of it all." She revels in history, she says, but would write only poetry, if she could write poetry at all. For relaxation, her recipe is a detective story. "When I am too tired or lazy to cope with the vast sense of things undone," she says, "and haven't enough sense to go to bed, I like a good detective story; you know the sort—foggy night on the Thames, corpse number one quite cold, to be followed by about two spares—not much sentiment, and still less psychology. I can't stand many in a row, and I don't very often have a chance to indulge. So I hardly belong to the honorable company, but it is a proper vice for my profession."

WHITE, PORTIA June 24, 1917- Singer
Address: b. c/o Hope Associates, 40 E. 49th St., New York City

When Portia White made her debut at the Town Hall in New York in March 1944, critics hailed the event as "the unheralded birth of a star." Since then, at recitals in many United States and Canadian cities, her rich contralto voice has been compared to that of the late Sigrid Onegin, and she has been called the "Marian Anderson of Canada." The first Canadian singer to be officially sponsored by her native province and city, Miss White was aided in her studies by the Portia White Trust which was established for her by the citizens of Halifax.

One of the six daughters and four sons of the Reverend and Mrs. William Andrew White, Portia White was born in Truro, Nova Scotia, on June 24, 1917. A month before, her father had sailed for Europe, where he served in England and France as the only Negro chaplain in the British forces in the First World War. When Portia was two years old the White family moved to Halifax, Nova Scotia, where the Reverend Mr. White had been appointed pastor of the Cornwallis Baptist Church.

The Whites were a "singing family," and the singer can hardly remember a time when she was not enjoying music in her home. When Portia was five her mother began giving her piano lessons, and when the child was six she joined the choir of her father's church. The White children represented their school in numerous competitive music festivals: Portia appeared at one of these festivals in Halifax when she was eight years old, singing with one of her sisters a duet arrangement from *Lucia di Lammermoor*. On Sundays, especially on rainy ones, she and her brothers and sisters were the mainstay of the choir at the Cornwallis Church—where some of the Whites still sing.

As Miss White tells it, she was always a bit discontented as a child. "I don't know why," she once said to a New York *Post* interviewer. "I had lots of freedom and lots of company, and I should have been happy. But I was always very tense and used to go around with a heavy heart. Perhaps it was because I wanted to express myself but didn't know how. Well, that heavy heart's one thing I've outgrown!" While attending public school in Halifax she won many prizes for her singing, and for three consecutive years was awarded the music festival's silver cup. While she was in high school she won a scholarship to the Halifax Conservatory of Music. This scholarship, awarded by a ladies' musical club, only paid for her voice lessons, and to help pay other expenses she found a position as a primary school teacher in a Halifax public school. She also attended the Dalhousie University of Halifax.

Portia White admits now that life has flowed smoothly for her and that she has never really had to struggle. As one writer expressed it, "Time after time when she has poured forth her rich dramatic voice, the right people have heard it, appreciated it, and done something about it." During her conservatory days she was in constant demand as soloist for music clubs and entertainments. One day in 1941 she sang at an afternoon tea, and afterward was asked to sing for a visitor, Edith Read, principal of the Branksome School in Toronto. Miss Read was so impressed with Miss White's talent that she promised to arrange a concert for her in Toronto, one of Canada's leading musical centers. The Toronto concert proved to be the turning point in the young contralto's career, for the papers gave such enthusiastic reviews of it that she was encouraged to give up her teaching position and to begin earning her living with her voice.

Another friend and counselor was the singer's voice teacher, Ernesto Vinci, who in 1939 was appointed head of the vocal department of the Halifax Conservatory on the recommendation of Arturo Toscanini '42. Under Vinci's direction, and encouraged by Miss Read's interest, the young singer worked diligently at her musical studies and appeared in numerous recitals in Canadian cities. Vinci is one of the committee who administer the trust fund which was created in Halifax by public subscription to enable Portia White to further her career. This fund has been made a permanent institution and will be used to aid other gifted Canadian musicians when Portia White has no further need of it.

In 1943 arrangements were made through Miss Read for the Nova Scotia girl to sing for Edward Johnson '43, manager of the Metropolitan Opera Company. He was interested in Miss White's voice, but urged her to return for another year of study with Ernesto Vinci to build up a larger and more varied repertoire. This she did, returning to New York the next year to make her debut in March at New York's Town Hall.

"She has one of the finest contralto voices to reach New York since Marian Anderson '40," wrote Henry Simon of *PM* after Portia White's first recital in New York. "It is a large voice with a firm, slightly metallic quality that gives a peculiar ring of authority to everything she sings." He also mentioned her ability to vary her tones, a gift displayed when she sang Verdi's aria "O Don Fatale" in a dramatic manner, and Purcell's "I Attempt From Love's Sickness To Fly" with light and delicate charm. A New York *Times* critic described her voice as "deep and impressive in the low registers, full and clear in the middle, and strong and vibrant on the top notes." Both critics felt that more time and experience were needed for the voice of the young Canadian singer to reach its full development. Others have commented on her clear diction and gracious stage presence.

After the Town Hall debut Portia White was recognized as a singer of importance, and when she returned to Canada she appeared at a command performance in Ottawa before the Earl of Athlone and Princess Alice. Her repertoire had been built up to include opera, *Lieder,* ballads, and spirituals. In October 1944 she returned again to New York and sang once more at Town Hall, this time in a concert sponsored by the New York chapter of the National Council for Negro Women. Again she was warmly received, critics describing her as "an artist of high rank," and "a singer with a future"; one writer wrote that she made "a hauntingly tender thing of Schubert's "Death and the Maiden"; another liked her singing of Saint-Säens' arias and other French songs. But there was criticism, too, particularly of her breathing and the uneven tones of her voice. To quote from *Musical America*: "Miss White is indisputably sincere and earnest and can lay claim to fine vocal material. . . . But it will do her no service to pretend that she has fully laid her artistic and technical groundwork....At present Miss White's pitch is not as secure as it needs to become; and to equalize her scale she should rid herself of her habit of forcing her low notes to the inevitable detriment of her medium ones. It ought then to become plain whether she is indeed a contralto or a mezzo-soprano."

In December Miss White sang with Alexander Kipnis '43, the basso, donating her services at a dinner given by the Emergency Committee to Save the Jewish People of Europe. Through the winter of 1944-45 she sang at many concerts for Canadians and for United States servicemen in Canada, and she appeared as a soloist at the Promenade Symphony Concert in Toronto under the baton of Andre Kostelanetz '42. In February 1945 a spring concert tour of South America was being planned. That same month it was announced that Miss White had been chosen by the National Film Board of Canada to appear in a motion picture entitled *This Is Canada,* to be distributed throughout the United Nations by the Dominion Government.

Hope Associates

PORTIA WHITE

Her third Town Hall appearance on December 5 again brought the young singer favorable reviews. "Miss White's voice is rich and full and vibrant with many lovely tones," was the comment of a New York *Times* critic. "One could carry away a very satisfying memory of beautiful tone," wrote a reviewer in the New York *Sun.* But they were both of the opinion that her vocal technique was not adequate for the proper exploitation of her natural voice.

Portia White is said to have charm and to be handsomer than her pictures show her to be. She is described as self-effacing and soft-spoken. She enjoys sports, books on philosophy, psychiatry, and on fantastic and imaginative subjects; and she likes to crochet and to listen to the radio and her brother's jazz band. Miss White hopes some day to sing in grand opera; a more immediate concern is her interpretation of spirituals, in which she feels she needs some coaching, for, as she has pointed out, Nova Scotia has never had the tradition of spirituals. Before a concert, nervousness prevents her from sleeping, and on such a night, after she has retired, her whole program runs through her mind—"complete with encores."

WHITEMAN, PAUL Mar. 28, 1891- Conductor

Address: b. c/o American Broadcasting Co., 30 Rockefeller Plaza, New York City

After a quarter of a century of prominence in music, Paul ("Pops") Whiteman, the man who popularized jazz in America and Europe and won for himself the title "King of Jazz," remains a bright star on the entertainment horizon. The fabulous Whiteman career helped to develop a school of musical composition in the jazz idiom and gained for it the serious consideration of musicians all over the world. Through vaudeville, night clubs, rec-

PAUL WHITEMAN

ords, concerts, films, and radio, the conductor has brought music to millions, introducing new works and new personalities. Among the Whiteman alumni are George Gershwin, whose *Rhapsody in Blue* Whiteman commissioned, Bing Crosby['41], Dinah Shore['42], Ferde Grofé['40], Mildred Bailey, Morton Downey, and the Dorseys['42]

Paul Whiteman is a native of Denver, Colorado, born there on March 28, 1891 into an affluent and artistic family. His father, Wilberforce James Whiteman, was supervisor of music in the public schools and reputed to have organized the first high school orchestra. His mother, Elfrida (Dallison) Whiteman, and his sister, Ferne, were both vocalists. Thus, in a household resounding with melody, young Paul developed an early love for music. His father presented him with a violin, but the boy's reluctance to practice caused him to be locked in his mother's sewing room each afternoon with only his violin for company. Finally Paul decided to end his woes by smashing the violin, only to discover that he would be forced to earn the money to replace it. After mowing innumerable lawns, the boy had saved enough money to buy an instrument, but according to Ring Lardner, "he spent it on a viola because it was bigger than a regular fiddle and no more expensive, and didn't seem quite so unfair for a boy his size to pick on." In high school, he joined the school orchestra and received training in classical music.

While still in his teens the young musician was first viola in the Denver Symphony Orchestra. Later he played in the San Francisco People's Symphony, in the orchestra at the San Francisco World's Fair in 1915, and in the Minetti String Quartet. The conductor has often expressed gratitude for these years of classical music which, he claims, prepared him for the work he was to do in jazz. During the First World War Whiteman served in the Navy, as bandmaster at Bear Island, California, with an orchestra of fifty-seven men. "The Navy sent me to radio school, too," Whiteman adds, "so that later, when I started recording with the orchestra, I knew what that microphone was thinking about us. It made a lot of difference."

Whiteman recalls that he first encountered jazz in a dance place on the Barbary Coast and was impressed with the effect the raucous music had on people. He finally abandoned the symphony orchestras to take a job in Tait's Cafe, but after one day he was fired because he could not play jazz. The musician then formed his own orchestra in 1919, organizing what has been called the first "dance orchestra." Playing at a hotel in Santa Barbara, Whiteman introduced his "symphonic jazz." Later in November 1919, he played at the Hotel Alexandria in Los Angeles, where such stars of the motion picture colony as Charlie Chaplin['40] and Douglas Fairbanks['40] were among his most ardent admirers, sometimes joining him in "jam sessions."

While Whiteman was "scandalizing the profession" by "jazzing" the classics, he was also being favorably mentioned in musical circles. Asked to play at the Ambassador Hotel at Atlantic City, the bandleader introduced his new musical style on the East Coast with great success. According to one writer, "Jazz à la Whiteman was a revelation to the Boardwalk. Jazz had been blatant and raucous. Whiteman's nine-piece ensemble whispered its heresies." Soon the orchestra was making records for the Victor Talking Machine Company, gaining national popularity—their first recording of "Whispering" sold slightly under two million, while one writer has remarked that enough Whiteman recordings of "Meditations" from *Thaïs* were sold "to pave the country." In 1920 came an invitation to play at Broadway's famous Palais Royale, and in the opinion of some critics the "Jazz Age" began with Paul Whiteman's arrival at that night club.

The bandleader's earnings soared; he organized orchestras for other night clubs, theaters, and ships—by 1924 there were fifty-two Paul Whiteman orchestras in the United States, Europe, and Mexico. In that period he also appeared on Broadway in George White's *Scandals,* while some time later he played in Ziegfeld productions. Ignoring the warnings of experts that a dance band could not possibly be successful in vaudeville, the "master showman" nevertheless essayed that medium next, making jazz history in five packed weeks at the Palace Theater, the mecca of vaudeville. In 1923 Whiteman introduced his music to the applauding British. He also gave a command performance in London. There, in the front line of his following were the Prince of Wales (now Duke of Windsor['44]), Lord Louis Mountbatten['42] and Lady Mountbatten.

On his return home Whiteman announced plans for a jazz concert, part of his campaign to win a wider hearing and recognition for jazz. The concert was to be held on Lincoln's Birthday, 1924, in New York's "sanctum of the Symphonic Muse," Aeolian Hall. According to Alton Cook, Whiteman was motivated by fear that his arch-rival, Vincent Lopez, planned to beat him to this artistic punch. Calling his program an "experiment in modern music," Whiteman played a varied concert, including "Livery Stable Blues", "Yes, We have No Bananas," and compositions written especially for the occasion by Victor Herbert and George Gershwin. The first performance of the latter's hastily written *Rhapsody in Blue* proved to be "one of the major milestones in the history of jazz." The mixed audience of jazz devotees and serious musicians heard this first concert of its kind with mixed emotions. According to Deems Taylor '40, "jazz came out of the kitchen and moved upstairs into the parlor," while Henrietta Straus, writing in the *Nation*, found in the music "a distinctive and well-developed art having obvious kinship with world-thought of today." The eminent writer, Carl Van Vechten, wrote in *Vanity Fair*: "February 12th, 1924, a date which many of us will remember henceforth as commemorative of another event of importance besides the birth of our famous President: George Gershwin's *Rhapsody in Blue* was performed for the first time by Paul Whiteman's orchestra with the composer at the piano." With the Aeolian Hall concert jazz came into its own. Thereafter Whiteman played in the leading concert halls of the country, often conducting famous symphony orchestras. He toured the United States and in 1926 again brought his music to Europe, winning applause in London, Paris, Vienna, and Berlin.

Controversy over jazz raged for many years in the musical field. General critical opinion gives to Whiteman the lion's share of credit for its present form and status. Whiteman found jazz a noisy, haphazard kind of music played largely by untrained musicians and transformed it into an influential and internationally popular idiom. Critics differ concerning the origin of jazz. Writing in *Collier's* in 1925, Robert Haven Schauffler contended that the first jazz piece was written by Beethoven as a scherzo for his sixth string quartet, which Schauffler labeled "worthy of the loftiest and latest traditions of Paul Whiteman"; and Ernest Newman, distinguished English music critic, once likened jazz to some British music of the fourteenth century. However, in his book *Jazz*, written in 1926 with Mary Margaret McBride '41, Whiteman claims that "jazz came to America three hundred years ago in chains." With the Negro slaves the new music came to America and flourished in the South, Whiteman continues. Tracing the history of jazz through its growth in New Orleans, the musician declares, "All I did was to orchestrate jazz. The time was ripe for that." The first to arrange music for the jazz orchestra, Whiteman also developed many style effects, such as muted horns, which have become part of the medium. He accepts John Philip Sousa's explanation of the origin of the term "jazz"—as derived from the minstrel show where performers "jazzboed" or improvised upon a melody. Books were written in English, French, and German on the new music, and critical columns often ranged from frigid to fervent comment on the subject.

To critic Lawrence Gilman, Whiteman's band in 1924 was representative of the best in jazz, while Virgil Thomson '40 considered jazz impossible for use in serious composition. In 1925 the critic of *Musical Life and Arts*, reviewing Whiteman's Boston concerts, declared: "This is music for the feet, not for the head or the heart." The following year, when Whiteman played Gershwin's one-act jazz operetta at his Carnegie Hall concert, critic Samuel Chotzinoff '40 said: "Musically, I believe it has immense significance." Henry Osborne Osgood in his book, *So This Is Jazz*, written in 1926, stated that Whiteman has "the largest and best jazz orchestra and in the repertoire especially arranged for him are practically all the pieces that have interested serious musicians in jazz and gained for it recognition as a legitimate element in standard music." The *British Musician* in June 1929 carried an article entitled, "Paul Whiteman—The Reformer of Music," in which the musician is described as "a man with an iron energy, with an extraordinary sense of music, and a positive belief that jazz can be beautiful." Determined to "cure" the experts of prejudice against jazz, Whiteman demonstrated its musical possibilities by introducing several serious jazz compositions. Among these works in addition to the now-famous Gershwin *Rhapsody*, are Deems Taylor's *Circus Days*, and the *Grand Canyon Suite* by Ferde Grofé, who served for many years as orchestrator for Whiteman.

Always experimenting with music, the jazz master in addition to playing new works often tried new effects. Reporting a Whiteman concert in 1933, a writer for the New York *Herald Tribune* stated: "Typewriters were among the instruments employed." In a *New Yorker* profile of the bandleader (November 27, 1926), Niven Busch, Jr., declared: "He is directly responsible for the artistic recognition of jazz and for many of its instrumental methods; his influence is obvious in numberless orchestras." Many of the Nation's leading jazz musicians have played in Whiteman's orchestra, including the famous cornettist, Bix Beiderbecke, who played under his baton in the late twenties, Tommy and Jimmy Dorsey, Red Nichols, Lennie Hayton, Henry Busse, Jack Teagarden, and Roy Bargy. The high artistic caliber of Whiteman's musicians has often been remarked—Rachmaninoff once termed the band "an orchestra of virtuosos." Whiteman considers jazz the folk music of modern America. Writing in the *Rotarian* (June 1939) on the topic, "This Thing Called Jazz," he stated: "Jazz is, first of all, a way of playing any music." In 1936 Whiteman established a Museum of American Music at Williams College at Williamstown, Massachusetts, contributing musical collections and scholarships to what he hopes will become a center of research in American music.

Whiteman has brought his music to the public through all the entertainment channels. His concerts have drawn capacity audiences to such well-known places as New York's Lewisohn Stadium, Madison Square Garden, Metropolitan Opera House, and Philadelphia's Robin Hood Dell. Whiteman has conducted in the leading hotels and theaters in the country and in 1936 he appeared in Billy Rose's '40 spectacle *Jumbo*. As guest bandleader at the Roxy Theater in 1943 he received $6,500, a record figure for a conductor without a band. Among the first bandleaders in films, he has appeared in short pictures for Vitaphone and 20th Century-Fox and features for the major studios. In the

WHITEMAN, PAUL—*Continued*

words of one writer, Whiteman's picture *King of Jazz* (Universal, 1930), "sent him hastily back to the dance floors." His other films include *Thanks a Million*, with Dick Powell, (20th Century-Fox, 1935), *Strike Up the Band*, with Mickey Rooney '42 and Judy Garland '41, (Metro-Goldwyn-Mayer, 1940), and *Atlantic City* (Republic, 1944). In 1945 Whiteman played his real-life role in the cinematic biography of George Gershwin, *Rhapsody in Blue* (Warner Brothers). A popular radio personality, he has been conducting music on the air since 1932, featured on programs over the Columbia Broadcasting System and the National Broadcasting Company. In March 1943 he was appointed musical director of the Blue Network, a position which enables him to carry out his musical ideas and plans. One such project was undertaken in 1944 when thirteen leading contemporary composers were commissioned to write compositions for radio presentation in a series entitled, *Music Out of the Blue*. Directing the series, Whiteman declared its purpose to be the attempt to find another *Rhapsody in Blue* or *Park Avenue Fantasy*. The composers chosen on a noncompetitive basis included Igor Stravinsky '40, Roy Harris '40, Leonard Bernstein '44, Paul Creston, and Morton Gould '45. Whiteman's executive duties have not curtailed his musical activities—since 1943 his music on the popular Philco *Radio Hall of Fame* has been frequently commended by *Variety*.

So that he might devote more time to radio work Whiteman in the fall of 1945 decided to refuse all future theater engagements (with the exception of his annual appearance at the Capitol Theater in New York). On November 7 the American Broadcasting Company put on a special anniversary show, "The First Twenty-five," built around the bandleader's music. It showed how the taste in popular music had changed through the years. For early 1946 Whiteman was planning a "mammoth event" at Carnegie Hall to celebrate his twenty-first year as a maestro.

Whiteman's broad proportions and tiny black mustache are well known. The man whom Olin Downes '43 once called "Jazz Jelly" has earned more money than any other conductor in America. The genial maestro is the author of many magazine articles on jazz and has often given advice to aspiring young musicians and has held auditions in numerous towns. His book, *How To Be a Bandleader*, written with Leslie Lieber in 1941, gives practical advice to jazz enthusiasts. Declaring that showmanship, tact, and business ability are primary requisites, he recommends a thorough grounding in the classics for the jazz musician.

"Man of many comebacks and no retirements," Whiteman once complained, "There's no time for golf or any real social life for a band leader." However, he does manage to spend some time with his family on his productive six-hundred-acre New Jersey farm. Whiteman was married for the fourth time on August 18, 1931, when film actress Margaret Livingston became his wife after having persuaded him to shed more than one hundred pounds. (The story of this slimming process is amusingly told by Mrs. Whiteman in her book, *Whiteman's Burden*, written with Isabel Leighton in 1933.) He has a daughter, Margot, and a son, Paul, Jr. Known as "Pops" to his friends, Whiteman is said to have a "horror" of heights, boats, and elevators. The man who "put jazz in a dress suit" believes that good music "does something to you. It makes your feet tap or else it stretches your soul."

WHITNEY, JOHN HAY Aug. 17, 1904-

Financier; United States Government official; sportsman

Address: b. 630 Fifth Ave., New York City; h. 972 Fifth Avenue, New York City

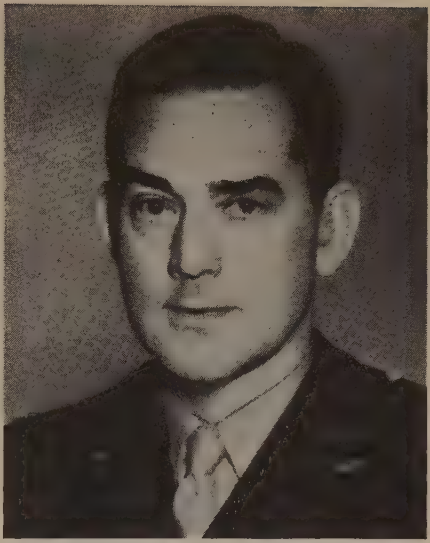
Colonel John Hay Whitney, better known as "Jock" Whitney, millionaire sportsman and financier, occupies the post of Special Adviser and Consultant on Motion Pictures in the United States State Department. Before he was appointed to that position Whitney had had a successful career in the film industry. He was board chairman of Selznick '41-International, the company which produced, among others, the Academy Award-winning films *Gone With the Wind* and *Rebecca*. From 1940 to 1942, before he entered the Army as a public relations officer, Whitney was director of the motion picture division of the Office of the Co-Ordinator of Inter-American Affairs, whose "good will" work in cultural and commercial relations between the United States and Latin America has been praised by diplomats.

Born on August 17, 1904, in Ellsworth, Maine, to Payne and Helen (Hay) Whitney, John Hay Whitney is a member of one of the most distinguished of the Nation's wealthy families. The Whitneys are descended from John Whitney, who came from England to Watertown, Massachusetts, in 1635. The first Whitney to figure in history was Brigadier General James Scollay Whitney; his son William C. Whitney not only founded the family fortune but was a person of great influence both in New York City and Washington political circles. In New York he worked with Samuel J. Tilden to destroy the "Tweed ring," and as Secretary of the Navy during President Grover Cleveland's first Administration he reorganized the Navy, introducing armor-plated ships. The Whitney millions were accumulated through this astute politician's investments in street railways and through his marriage to Flora Payne, daughter of Henry B. Payne, noted railroad builder, who also was a United States Senator. Through his mother, John Hay Whitney is a grandson of John Hay, statesman and author, who was assistant private secretary to President Abraham Lincoln, Ambassador to the Court of St. James, and Secretary of State under Presidents William McKinley and Theodore Roosevelt. During John Hay's regime in the State Department he became known as "a maker of policies," responsible for the Open-Door policy in China and for the Hay-Pauncefote treaty.

Friends of Colonel Whitney, an athlete noted for his "gladiator-like" build, like to recall that his formal education began at Miss Chapin's select school for young ladies. Little John was in the school's kindergarten class which, at that time, admitted equally select young men. In 1916, at the age of twelve, young Whitney was sent to Groton, where he remained until 1922. There he distinguished himself in baseball and football, won the heavyweight boxing championship, and in his senior year was elected president of his class. "But, from the time he saw Forbes-Robertson in Shakespearean roles at the age of six," relates an *American* Magazine article, "his private ambition was to get into theatricals." Soon after entering Yale (1922), the university of his father and grandfather, Jock, as he has been called since his knee-trousers days, "wangled a small role in Bernard Shaw's '44 *Caesar and Cleopatra*." In the scanty tunic of a Roman soldier young Whitney's physique, rather than his histrionic ability, was praised. After that, says Whitney, although "I was busy as possible in dramatics, I knew better than to think I could ever be an actor." As his father before him, he excelled in Yale athletics. He was on the varsity crew and was also adept at squash and tennis.

In 1926 Whitney left Yale to enter Oxford University, but upon the death of his father in 1927 he returned to America to take up the management of his estate, which has been variously reported as the interest on $27,000,000 or a fourth share of $240,000,000. (On the death of his mother in 1944 he and his sister are said to have divided another fifty millions.) To prepare himself for this part in his many-sided career the young heir clerked for a brief period, at a salary of fifteen dollars a week, in the Wall Street house of Lee Higginson.

In addition to the fortune founded by his grandfather and greatly increased by his father, John Hay Whitney inherited their interest in horses. His grandfather had won the 1901 English Derby. His mother, known internationally for her charm and intellect, had after her husband's death divided her time between her many philanthropies and her turf enthusiasm. She owned the famous Greentree Stables and her colors, candy-striped black and cherry, were carried to victories in both hemispheres. Among the horses in the Whitney stables are Twenty Grand and Shut Out. *Country Life* reported in 1935 that Jock Whitney, as owner of the largest string of horses in America, had horses in England, Ireland, Virginia, and Kentucky, and kept polo ponies at his Long Island estate. "Recognized in his own right as a breeder and judge of horseflesh," Whitney was one of the youngest members of the Jockey Club, president of the American Thoroughbred Breeders Association, and vice-president and stockholder in the Westchester Racing Association, which operates Belmont Park. One honor to come to him in this field was his appointment by Governor Herbert Lehman '43 to the three-man New York State Racing Commission. His greatest disappointment on the race courses was in 1929 when his pet horse, Easter Hero, after leading a record field of sixty-six in the Grand National, cracked one of his shoes and limped in second.



COL. JOHN HAY WHITNEY

Whitney has carried on the family tradition in polo, too. His uncle, Harry Payne Whitney was captain and chief strategist of the "Big Four," which *Fortune* magazine credits with being "the finest polo team ever assembled." In 1924, when Harry Payne Whitney dropped out of the game in which he had been prominent for twenty years, young Whitney, with his "Greentree Team," took over. Under his captaincy and with Tommy Hitchcock, Jr., "the greatest poloist the world has yet seen," the team achieved during its life (it was disbanded in 1940) the record of winning two United States Open championships in succession and the Waterbury Cup (1935). Although Whitney became internationally famous as a polo player it was not known to polo fans that he was forced to wear contact lenses because of faulty vision. "Yet, Jock never hesitated," says Tom O'Reilly, *PM* sports writer, "to stick his head in where the mallets flew thickest, and he had a surprising habit of playing like a world-beater when the chips were down." Whitney, upon his retirement in 1940, had a six-goal handicap rating. In describing Whitney the sportsman, Daniel Fosdick Parker said: "He is just about one of the physically strongest sportsmen in the country. . . .He stands six feet one and weighs almost 200 pounds. . . .He is built like an old-time gladiator."

"I love the theater," is the explanation the millionaire-sportsman gave when asked why he had become one of the biggest investors in Broadway plays. Although his theatrical attorney, John Wharton, has said that Whitney will finance an almost certain failure if he thinks "the play has something to say that should be said," his investment in some thirty plays from 1929 to 1945 has netted a nice profit, which is devoted to Whitney charities. The Whitney money (his sister, Mrs. Charles

WHITNEY, JOHN HAY—*Continued*

Payson, and his cousin, Cornelius Vanderbilt Whitney, often are represented in Jock's theatrical and movie enterprises) has been in the following hit plays: *Broken Dishes, Post Road, Whistling in the Dark, Kind Lady* (original production), *Gay Divorce,* and *Life With Father.* His worst wrong guess, he says, was Peter Arno's '42 musical, *Here Goes the Bride,* which is reported to have lost him $100,000. Although Whitney's own dramatic judgment has been reliable, he had by 1940 formed the Wharton-Gabel Corporation, which is headed by two experienced theatrical people. One instance of his dramatic sense is the story of how he relied upon his own judgment in investing in *Life With Father.* The late Robert Benchley '41, actor-humorist and one-time dramatic critic, who, as one of Whitney's closest friends, often advised him on plays, sent back the script of "Father" with the comment: "I could smell this alleged comedy you want to back, before the mailman got it up to the door. If you don't want to lose your shirt, lay off." Despite Benchley's advice, Whitney placed his money in the show. *Life With Father* began its history-making run in 1939, and in its sixth year, after grossing nearly eight million dollars from its Broadway and road company runs, was sold to the movies for the highest price ever paid for a play—a down payment of $500,000, with royalties on the film's gross.

"When Socialite Whitney invaded the motion picture industry, which had long been monopolized by a small clique of specialists," reports *Time* Magazine, "Hollywood veterans smirked, knowingly predicting he would singe his fingertips." But by 1940, when he sold out some of his Hollywood interests because of world conditions, Whitney had made a profit of over a million dollars. His first venture in the film industry was the organization of Pioneer Pictures to produce pictures in Technicolor, a process which at that time no one in Hollywood "would touch with a ten-foot pole." In return for Pioneer's use and publicizing of the new medium, Whitney received a bonus of 100,000 shares of stock at below market price from its inventor, Herbert T. Kalmus. The initial production, *La Cucaracha,* grossed more than any other short in film history, including Walt Disney's '40 *Three Little Pigs,* but the next production, *Becky Sharp,* a full-length film with Miriam Hopkins in the star role, suffered a series of mishaps during its making and cost more than it earned in box-office receipts. "But the film proved the worth of the color technique—Jock's ace in the hole—and in the long run with its stock shooting up from three to thirty, more than repaid the cost of the film."

In 1935, Whitney, with David Selznick and others, formed Selznick-International, the motion picture company which made such "four-star" hits as *A Star Is Born* (1937), *The Prisoner of Zenda* (1937), *Rebecca* (1940), and *Gone With The Wind* (1940). With the last named, Whitney again showed his ability to judge the dramatic value of a story from a script. Selznick had been "cold" to the story when an agent sent him a synopsis of the then unpublished *Gone With The Wind.* Nevertheless, Whitney took it with him on a plane trip to Hollywood. "Two hours later," relates the *American* Magazine, "he leaped out of the ship at the Pittsburgh airport to send a wire back to New York. 'If Selznick won't purchase the book for company, I'll buy personally.'" His quick decision enabled the company to buy the film rights for this best of best-sellers for the very low sum of $50,000—a month later Selznick-International turned down an offer of $350,000 for the story. Its filming, made at a cost of $4,250,000, not only won the Academy award of 1940 but has proved to be one of biggest box-office attractions in film history. In 1943 when Metro-Goldwyn-Mayer (one of the investors) bought outright Whitney's interest in "GWTW," it had grossed in domestic rentals $31,000,000 and it was expected to gross another $10,000,000 to $15,000,000 with the reopening of foreign markets after the Second World War.

Although Whitney is proud of his wise investments, he does not deny that he has made some unwise decisions. Among these is his investment in "some weird tree which was supposed to corner the hemp market," and his backing with Marshall Field, 3rd '41, William Benton '45, and others, of the New York paper, *PM.* (Three months after the founding of *PM* Whitney sold Field his interest at twenty cents on the dollar, plus a fifteen per cent interest in the voting stock.) Whitney also owned a considerable share in the magazine *Polo* and the old *Outlook.* His other business connections include the board chairmanship of the Freeport Sulphur Company, which during the war produced 130,000 tons of manganese annually; directorship of the Great Northern Paper Company, the Publications Research Corporation, and the Pan American Airways, Inc. This last-named in 1940 had already won him a profit of 50 per cent on his investment. He is also a trustee of the United States Trust Company and of the New York Hospital. His philanthropies include a gift of five million dollars to Yale University, made by himself and his mother for the erection of a new gymnasium in memory of Payne Whitney.

The Whitneys have long been patrons of art and Whitney has shown much pride in his connection with the Museum of Modern Art. A member of the board of trustees since the museum's establishment in 1931, and president of the Film Library since its beginning in 1935, he became the museum's president after the resignation of Nelson A. Rockefeller '41 in 1940. After the United States entered the War, Whitney announced that the museum, in cooperation with the Federal Government, would open a new program "to improve relations between the United States and the Latin American republics, through the interchange of art and culture." The most famous paintings in Whitney's personal collection are Renoir's *Le Moulin de la Galatte* and a Gilbert Stuart portrait of George Washington.

When the United States public became aware of the fact that organized "fifth columns" throughout the Americas threatened the harmony existing between the Americas, Nelson Rockefeller, John Whitney, and a number of other energetic young men decided to do something about it. In August 1940 President Franklin D. Roosevelt '42 approved an organization which they had planned and through an executive order made it a branch of the Council of National Defense with the title, Office for

Coordination of Commercial and Cultural Relations Between the American Republics. This title was later changed to Office of the Coordinator of Inter-American Affairs. "The State Department," said *Time*, "which cherished the professional's distaste for the amateur . . . developed toward it an attitude of chilly reserve." By June 1941, however, "the reserve had noticeably thawed." The State Department and the rest of Washington as well observed that the new organization "had accomplished a good deal, seemed on the way to accomplish more." Whitney, in charge of the motion-picture division, had persuaded Hollywood producers to rid their films of sequences offensive to Latin Americans, to send Hollywood stars on good-will tours of Latin American countries, and to produce pictures with sympathetic Latin-American backgrounds.

After two years of service with the office of Inter-American Affairs, Whitney, in May 1942, entered the Eighth United States Army Air Force as a captain in the Combat Intelligence Division. Sent to England in August of the same year, he was made public relations director of the Eighth and subsequently promoted to the rank of major. Then, in February 1943 he accompanied General Ira C. Eaker '41 to the Mediterranean theater, where he rose to the rank of, first, lieutenant colonel and, later, full colonel. Four days after his fortieth birthday, Whitney was captured by the Nazis while riding in a jeep with four companions through southern France. With shaved heads, the prisoners were put aboard a train carrying German units out of France. They were dive-bombed and shelled by Allied artillery and the French underground, and the journey, Whitney later related, "was a veritable hell." But the confusion from the attacks which destroyed three locomotives during an eleven-day journey enabled him and his companions to escape. Eighteen days after his capture Whitney had made his way back to his base.

In March 1945 Whitney was decorated with the Legion of Merit—the citation read "for exceptionally meritorious conduct in the performance of outstanding services from February 15, 1943, to January 1, 1944." His appointment as special adviser and consultant to the State Department's Public and Cultural Relations division under the directorship of William Benton and the International Information Service under Ferdinand Kuhn was announced on October 15, 1945. He advises on relations with the motion picture industry, "growing out of the activities not only of the Office of War Information and the Office of Inter-American Affairs, but also of the past and present interest of the State Department." Information and documentary pictures "aimed to give peoples of other countries a better idea of Americans," also come under his supervision.

In 1930 Whitney was married to Mary Elizabeth Altemus, Philadelphia socialite who has been described by Elsa Maxwell '43 as "a hard-hitting, swashbuckling, hard-riding gal who took many a tumble but never came a cropper," and who shared her husband's interest in the theater-world. Ten years later the Whitneys were divorced, with Whitney reportedly settling three million dollars on her. In 1942 Whitney was married to Betsy Cushing Roosevelt, former wife of James Roosevelt, eldest son of the late President. The brown-haired Mrs. Whitney has two daughters, Sara Delano and Kate, by her former husband. During the War Mrs. Whitney and her sister, Mrs. Vincent Astor, created Ship's Service, "one of the best volunteer organizations for naval aid in New York." The Whitneys have a Fifth Avenue house, a Georgia plantation, and a Long Island estate, "Greentree." At "Greentree" there is a polo field and for the benefit of guests, a field house has been equipped with all kinds of sports clothes in almost every size. Whitney's Radio City office has a kitchenette and a "Romanesque" marble bathroom. In an inner, sound-proof office the "zestful giant" conducts the affairs of his many-sided career. Dark-haired, with hazel eyes, he has been described as "quiet-spoken, almost embarrassingly modest."

WHITTLE, FRANK June 1, 1907- Royal Air Force officer; inventor

Address: b. c/o British Air Ministry, London

"I am completely embarrassed. Damn it, I wish I had been a doctor." With these words Air Commodore Frank Whittle, R.A.F. group captain and inventor of the first successful jet-propulsion engine for aircraft, stepped right into the tradition of the shy man of science who quietly sets the world on end and then runs like the hare from publicity. In October 1944 Whittle's invention brought him the highest award of the Council of the Royal Aeronautical Society, the gold medal that had been awarded on only seven previous occasions in thirty-five years, the first time, in 1909, to the Wright brothers.

Dark and slight, Air Commodore Whittle, whose invention inspired wary gentlemen of the press to talk blandly in terms of space ships and interplanetary travel, was born in Coventry, England, on June 1, 1907. Whittle, senior, was an inventor himself, and his boy showed very early an interest in tinkering: the family album shows a snapshot of four-year-old Frank holding a model plane in his hand. At sixteen he became an apprentice with the Royal Air Force. He showed such an unusual talent for designing model planes that he was awarded a cadetship and began flying in 1926. In the two years which followed he studied at Cranwell, the RAF College, receiving at the end of his course the Abdy-Gerald-Fellowes Memorial Prize for aeronautical sciences.

After the cadetship, in 1928 he became a pilot officer in No. 111 Fighter Squadron. In 1929, while in the instructors' class at the Central Flying School, he began work on his jet-propulsion idea. The next year he was promoted to flying officer and assumed the position of instructor at No. 2 Flying Training School, Digby. (He was married that year and now has two sons.)

"By 1930 he was probably the most brilliant pilot in the RAF," says George Peyton, of

British Official Photo
AIR COMMODORE FRANK WHITTLE

the New York *Herald Tribune*. "Like many great men he is an amazing mixture of cold deliberation and crazy daring." Friends and observers thought, however, that it was simply crazy daring that impelled him to perform a "bunt" (an outside loop that stumped experts) in a plane considered unsuited for the purpose. Emerging from the feat he remarked with complete *sang-froid*: "It wasn't difficult or even dangerous. You see, I'd worked it all out on a slide rule."

In 1931-32 the airman was a test pilot on float seaplanes, specializing in catapult work. After that there was a year's study of engineering at Henlow, and in January 1934 he was promoted to flight lieutenant. He then spent three years at Cambridge University, where he obtained a First Class Honors Mechanical Science Tripos. Squadron leader and group captain successively in 1937, he became a wing commander in June 1940 and air commodore in October 1944.

"The idea of a jet-propelled aircraft first came to me as a cadet at Cranwell," Whittle admitted in a rarely communicative moment. "When we had to write a science thesis I chose as my subject the future development of aircraft. I am delighted it has worked out so well, and it is only the beginning."

In an embryonic state, jet propulsion has existed for centuries. According to *Newsweek* Magazine, its principle dates back to a hundred years before Christ, when the Alexandrian mathematician Hero demonstrated an aeolipile, which *Webster's* defines as "an apparatus such as a globe or cylinder with one or more projecting bent tubes from which steam is ejected, causing the cylinder to move." This "action against reaction" is quite simply explained by a demonstration with a toy balloon: release the neck of an inflated balloon and the expulsion of air will shoot it quite a distance. This principle is applied to jet planes through a "power plant" that sucks in air, compresses it, mixes it with gasoline, and then ignites the mixture. This causes a tremendous expansion, and the combustible gases pass through turbine blades and are expelled through a tailpipe nozzle. The thrust of the compressed gases against the atmosphere sends the propellerless airplane forward.

Replacing the propeller, Whittle's jet propulsion eliminates some of the most retarding features of a propeller-driven plane. Functioning as a screw, the propeller "bites" into the air. At heights where the air is thin it has little to take hold of. On the other hand, the "jay-pee" (its abbreviated name) reacts more favorably at a high altitude; its expelled gases expand in a rarified atmosphere, thus increasing the plane's drive. The actual speed of the jay-pee has never been announced, but it is known that the jet leaves the tail of the plane at 740 miles per hour. While this fast, high-stepping little craft will obligingly perform on kerosene, crude oil, or even powdered coal, it consumes fuel at an extremely high rate, thereby cutting down its operating range. Dynamite on the ground as well as in the air, the jay-pee acts as an oversized vacuum cleaner, swallowing whole whatever chances too near its air intake. Legend has it that unwary birds, sporting in the heavens, are suddenly sucked into the jet to emerge at the tail "skewered, cooked, and ready for the table."

The jay-pee might never have been completed, one of its original supporters has stated. Commodore Whittle might have been peddling a worthless invention for shelling peas for all the attention his jet engine received from the big industrialists of England. He became so discouraged that for five years he did not even bother to pay the renewal on the original patent taken out on the engine in 1930. Four classmates at Cambridge lent him their moral support. Two of them, Tinling and Williams, former RAF men and partners in business, scraped up enough to finance Power Jets, Ltd., and bring up the "Squirt" to maturity.

By 1937 Whittle's first engine actually ran, and in 1939 the British Air Ministry placed an order for the first jet-propelled airplane. The Gloster Aircraft Company was appointed to design and build a plane, and Power Jets, Ltd., was to make the engine. Whittle prepared to perfect his brain child. Recruiting three talented men to form a crew, he moved his work into an old disused foundry on the outskirts of a Midlands town. (The local people thought they were making sausage machines and complained of the noise.) It was a willing crew. One of the "back room boys," Bozzoni, alias "Old Bozzy," had a particular talent for turning marvelous machines out of scrap and his imagination, obligingly sweeping the factory floor as well. When the engine was ready for its first test the employees, by then numbering forty, stopped just long enough to toast their success with a bottle of champagne and affix their signatures to the bottle. English countryfolk became frightened and mystified by sporadic appearances of the strange plane that sounded "like a giant whistling teakettle on the boil," then was gone before they could draw another breath. They soon got so used to it, however, that they began to give it nicknames: "Putt-Putt", "Hush-Hush", "Siberia", "Super-Secret," and "Squirt," which in time became the favorite one.

In July 1941 the British Air Ministry turned all information on the jet plane over to General Henry H. Arnold '42, and in September, Whittle and his colleague "Bozzy" flew to America with the engine's parts. There they took assumed names, moved from place to place to avoid attracting notice. The Bell Aircraft Corporation contracted to manufacture the P-59 body in the United States, and General Electric Company, the Whittle engine. The American jay-pee is a two-motor plane, in contrast to the single-engined Gloster that is manufactured by the British. For military purposes both types could serve either as interceptors of enemy bombers or as high-altitude reconnaissance crafts. What the Mosquito plane was to the bomber, the jay-pee could be to the fighter command. The details of its further development and actual use, however. remained secret. Jet propulsion has been adapted to take-off equipment for use on propeller-driven planes to enable a plane to carry a heavier load than it would ordinarily be able to lift from the ground. Robot bombs were also equipped with jet propulsion engines before the war was over, and the principle has been applied to helicopters.

If a "super secret," it was asked, why let it out before the new weapon could be sprung as a surprise on the Germans and the Japanese? For one reason, jet propulsion was actually no secret. Major European powers had been experimenting with the idea, although the results were not revealed. The announcement of the jay-pee at a time when German morale was toppling, suggested observers, was all part of the Allied war of nerves. On the other hand, Brigadier General B. W. Chidlaw, chief of the matériel division of the United States Army Air Forces and one of the first to test the plane, offered an entirely different reason. As he broadcast on the *Army Hour* program: "While the German technique of propaganda in announcing new and secret weapons of war is to terrorize and frighten the enemy, our reason, however, for making it public now is prompted by a motive only a free people can understand. . . . Your sons will some day fly these planes. You are entitled to know, within the bounds of national security, that all our resources are still at work to turn out better planes and better equipment to make our Allied air forces the best air forces in the world."

WHITTY, DAME MAY June 19, 1865-
Actress

Address: c/o Metro-Goldwyn-Mayer Studios, Culver City, Calif.

With the opening of the play *Thérèse* in October 1945 and the première of the film *My Name is Julia Ross* in November 1945, Dame May Whitty, eighty-year-old trouper of the English stage, joined the envied company of those who find their names in lights simultaneously on both theater and movie marquees. When in 1936 and 1937 she first became familiar to large American theater and movie audiences with the portrayal of Mrs. Branson in *Night Must Fall*, she was already a veteran of almost a hundred roles, the listing of which filled more than three columns in the 1936 *Who's Who in the Theatre*. In 1945 Dame May can celebrate the sixty-fifth anniversary of a distinguished career on the stage.

DAME MAY WHITTY

May Whitty, daughter of Alfred and Mary (Ashton) Whitty, was born in Liverpool, England, on June 19, 1865. Her paternal grandfather, Michael James Whitty, was for a time the owner and editor of the Liverpool *Journal*, and in 1855 he founded the Liverpool *Daily Post*, the first penny daily issued in Great Britain. Journalism was likewise her father's profession, and Miss Whitty's childhood was consequently passed in what has been called a "typical newspaper atmosphere." She was privately educated, and recalls that by the time she was ten years old she had read much of Dickens, Scott, Thackeray and other English authors. This, she thinks, has done her more good than any other part of her early education. As a child she loved the theater. She used to sit breathless, she says, as the footlights went on and the green baize curtains went up behind the proscenium arch, "revealing the painted drop with the formal garden and pool, with a troubadour leaning against a marble pillar and cupids flying all about." The stage was fairyland, and May Whitty's ambition was to become a part of it.

Her opporunity came at the age of fifteen, when her mother, who knew Madge Kendal, obtained an interview for her with the famous actress. Mrs. Kendal gave the stage-struck but awed girl a note of introduction to the manager of the Court Theatre in Liverpool, the result of which was Miss Whitty's first appearance on the stage, in *The Mountain Sylph*, an adaptation of the ballet *Les Sylphides*. That was in 1881. There followed several other appearances in Liverpool, and on April 22, 1882, she made her London debut as Fillippa in *Boccaccio* at the Comedy Theatre. The next year John Hare of the Hare and Kendal

WHITTY, DAME MAY—*Continued*

(William Hunter Kendal, husband and leading man of Madge Kendal) management at the St. James' Theatre engaged May Whitty as understudy to the then much publicized Miss Webster, granddaughter of the famous London actor and manager Benjamin Nottingham ("Ben") Webster. A frequent visitor at rehearsals of the company at that time was Miss Webster's young brother Ben, then a law student, whom young May Whitty thought the handsomest man she had ever seen. It is interesting to note that both Miss Whitty and her future husband, who in 1887 was to desert the bar for the stage, made their initial recorded appearances under Hare and Kendal in the same play, *A Scrap of Paper*, in December 1883. (May Whitty and Ben Webster were married in August 1892, and celebrated their golden wedding anniversary in 1942. They have one daughter, the noted Shakespearean director and actress, Margaret Webster '40.)

Until 1885 Miss Whitty remained at the St. James, chiefly as an understudy. Then, at the age of twenty, she went on tour with a repertory stock company, an engagement of which Margaret Webster relates: "My mother played fourteen parts in two weeks, with one rehearsal for each—parts such as Lydia Languish and Kate Hardcastle, [Lady Teazle, Lady Gay Spanker], plus some meaty old melodramas and a farce or two. Between rehearsals and performances she made her own costumes." In the next decade May Whitty appeared in such plays as *Harbor Lights, The Monk's Room, Linda Grey, Beauty's Toils,* and others; she toured in *The Candidate* and *Hoodman Blind*. Sometime between 1885 and 1887 she was a member of Ben Greet's original Shakespearean company. (Her earlier experiences with the Bard's plays included roles in the rarely produced *Two Gentlemen of Verona* and in the Kendals' production of *As You Like It*.) In 1888 she played with Richard Mansfield in *Prince Karl* and with Kate Vaughan in *She Stoops to Conquer* and *School for Scandal*. In 1894, she toured with Forbes-Robertson as Comtesse Zicka in *Diplomacy* and as Irene in *The Profligate*. On May 8, 1899, she played the Countess Cathleen in William Butler Yeats' play of that name at the opening performance of the Irish Literary Theatre, the unit later to become famous as Dublin's Abbey Theatre. Along with repertory stands in the 1890's, appearances in two or even three plays a year was accepted practice, and melodramas formed a considerable portion of the fare. Melodramas of those days, reminisces Dame May, "were dramas of situation with big scenic effects. In *Harbor Lights* the hero climbed down over the cliff to rescue the heroine. *Hoodman Blind* was about twin sisters, and I played both of them. One was good and the other bad, the bad one throwing herself over the Thames embankment."

In June 1895 the actress joined the Lyceum Company of Sir Henry Irving and Ellen Terry, then the giants of the English stage. But, unfortunately, she recalls, she "never had a chance to see Sir Henry building up his roles. He was hard to work with, because he was dreadfully remote, as was the rule with most of the great actors of that school and period. Long before I ever knew him to work with he had mastered all the lines and business and technique of every play he produced, so that I could never see a representation being evolved." "Ellen Terry," Dame May told an interviewer, "was the kindest and grandest woman I have ever known" and one of the few actresses who acted with "grace and simplicity" in an age which, judged by modern histrionic standards, was given to declamation and excess emotionalism. Dame May thinks herself fortunate in having been asked to assist Ellen Terry in the preparation of new roles, reading the lines of them to her. Thus the younger actress was able to observe the star's characterizations developing. Miss Whitty's roles with the Lyceum Company, as given in *Who's Who in the Theatre*, were Marie in *Louis XI*, Julie in *The Lyons Mail*, Emilie in *The Corsican Brothers*, the daughter in *The Bells*, and the Gentlewoman in *Macbeth*. From September 1895 to May 1896 she toured with the company in the United States. It was her first visit—though Irving's fifth—and it was marked by the presence of her husband, Ben Webster, in the company.

While Ben Webster remained with Irving at the Lyceum until 1898, May Whitty left the company shortly after the conclusion of this American tour because she was not receiving suitable parts. At various theaters in London for the next several years she played such roles as Edith Varney in *Secret Service*, Rosamond Pilliner in *Cupboard Love*, Mrs. Grace Tyrrell in *The Heather Field*, Katherine Blake in *The Last Chapter*. At the Vaudeville in August 1903 Miss Whitty began an engagement as Susan Throssell in Sir James M. Barrie's *Quality Street*, afterwards touring with the play. Early in 1905 she accompanied Ben Webster to New York where he was to play opposite Ellis Jeffreys in *The Prince Consort* and at the end of the year with Grace George in *The Marriage of William Ashe*. (It was during the run of the former play, on March 15, 1905, that Margaret Webster was born.) In December 1907 she took the role of Carrie Hardinge in the Viola Allen production of *Irene Wycherly* in Baltimore and New York.

Returning to London Miss Whitty joined Charles Frohman's repertory company at the Duke of York's, playing Dame Dresden in George Meredith's *The Sentimentalists*, Amelia Madras in Harley Granville-Barker's *The Madras House*, and Mrs. Trafalgar Gower in Arthur Wing Pinero's *Trelawney of the Wells*. During rehearsals of the latter two plays, says Margaret Webster, Miss Whitty encountered her first real specimens of the genus director, vintage twentieth century. (When she began to act there were no directors, only stage managers to distribute the meticulously marked prompt copies dictating moves laid down by actor-managers.) Pinero, relates Miss Webster, was a "martinet who drilled his actors in every detail of movement and inflection. Sometimes . . . imposed mannerisms supposed to indicate character. I remember my mother sedulously practising a high screech demanded by Pinero, half giggle and half snort, till people on the streets turned round to stare, and the cook gave notice." And Granville-Barker, she adds, "gave [my mother] a long dissertation on the history, habits, idiosyncracies and antecedents of a character in *The Madras House,* all of which she was to convey to the audience by the significance with which she said her first line. The line was 'Good afternoon.'"

In the second decade of the century Miss Whitty still generally acted in several plays a year. She portrayed Peg Woffington in *The First Actress*; took roles in *Ready Money, The Grand Seigneur, Iris Intervenes*; was Mrs. Sharp in *The Passing of the Third Floor Back.* Although not a star as Ellen Terry was a star, she was seldom off the boards for any length of time. English critics who habitually paid more attention to the play than to the players, characterized her performances as "admirable," "splendid," "superb," and, as she grew into the portrayals of older personalities (she was over fifty when she played in *The Passing of the Third Floor Back* in 1917), delighted in pointing out that, no matter how bad the play, Miss Whitty always gave the excellent performance expected of her.

Between performances during the First World War the actress, as a prominent member of the Actresses Franchise League, helped to organize the Women's Emergency Corps, devoted to placing women in war work in hospital and factory. As the head of the W.E.C. she was instrumental in organizing workrooms for the disabled and conducted a successful campaign to raise funds for the Star and Garter Home for Disabled Sailors, Soldiers and Airmen. In recognition of her services, on January 1, 1918, King George V decorated May Whitty with the silver star and gold cross of the Order of the British Empire, conferring upon her the title of Dame Commander of the Order (equal in rank to Knight Commander).

At the age of seventy-five Dame May is said to have exclaimed, "Quit? Only the aged and infirm quit, and I am neither! So long as I can do my bit, I'll keep right on doing it!" It is not surprising, therefore, to find her in 1928 at the age of sixty-two touring South Africa in repertory with Zena Dare and later, in 1937, beginning a movie career at the age of seventy-one. (Ben Webster, who had previously acted with his wife in a number of plays, joined her in both ventures.) In 1920 she had toured as Lady Marsden in *Mr. Pim Passes By.* In 1921 she had undertaken the management of the Florence Etlinger Dramatic School. (This she relinquished about 1926.) And her successes in this period both before and after the South African tour included roles in Pinero's *The Enchanted Cottage,* Charles Pollock's *The Fool,* Frederick Lonsdale's *The Last of Mrs. Cheney,* Barrie's *Dear Brutus,* John van Druten's '44 *There's Always Juliet* (which she also did in New York), Granville-Barker's *The Voysey Inheritance,* and Ronald MacKenzie's *The Maitlands* with John Gielgud, who particularly commended her performance in his autobiography. Wrote a New York reviewer of *There's Always Juliet*: "Dame May Whitty, as Leonora's disapproving maid, catches with sure technique the exact degree of acid dignity needed to set a background to the cavortings of the lovers. This favorite English actress deserves to be seen in parts which offer a larger range for her matured skill." Ivor Brown said, "Dame May Whitty as the mother [Mrs. Surrege in *The Lake*] once more reveals her charming ability to get under the skin of the English middle class. Most actresses would have tidied up the part of Mrs. Surrege and given it a quite unbourgeois polish and lacquer of theatrical smartness. Instead, it is played with extraordinary fidelity to the woolly-minded fact." Concluded the (London) *Saturday Review* concerning *The Ringmaster*: "Dame May Whitty, of course, could not put a wrong foot as the dear devoted mother who always appeared at the wrong moment and ventured the most tactless remarks."

Dame May's roles had changed since her first years in the theater, but they had changed to her liking. "I rather like playing terrors," she told an interviewer, "I really prefer playing taciturn, self-centered, fatuous individuals. I find they are fascinating to create, although they are much harder to act than docile, sweet types. And it amuses and compliments me to hear persons remark about such a performance: 'She certainly reminded me of Aunt Cora or Jim's sister,' showing that a really acid role gets far more attention than an old knitting grandmother." And the theater, too, was altered from the days of Irving and Terry, of Mansfield and the Kendals, she commented in 1932. "The individual giants of the stage when I first knew it were far more god-like and impressive than any actors and actresses of today, but the average of technical competence and professional accomplishment wasn't nearly so high. . . .In general, I believe that there is far more good acting on the English stage today than ever before. For one thing, the whole method of expression has changed. Emotion is now expressed by concealing it. The technique is far more difficult and calls for greater adroitness just as it calls for far more intelligence on the part of audiences to follow a modern play."

In 1935 Dame May scored one of the biggest triumphs of her career as Mrs. Bramson in Emlyn Williams' '41 *Night Must Fall.* Her performance, said the London critics, was "superb", "a masterpiece of subtlety." Brought to New York in 1936, it drew from the New York *American* reviewer the plaudit: "It has been the better part of a year and a half that Dame May Whitty has been paralyzed by fear of being assassinated some misty twilight by that ruthless psychopathic, Emlyn Williams, in his own evil invention, *Night Must Fall,* and for the better part of a year and a half, she has been going on giving that same admirable performance of the acidulous, miserly and fright-crazed hypochondriac, Mrs. Bramson." "Her performance," wrote the New York *Herald Tribune* critic, "might give many a younger and more languid actress pause. The scene in the last act where she finally rises from the wheel chair she has occupied all evening, strides vigorously around the stage and then bursts into wild hysterics, amazes those who know she is seventy-two years old." Of this same scene—and testifying to her vitality—Dame May said, "It leaves me breathless and a little gaspy for the rest of the act, but otherwise I feel no strain. I did it for a year in London, and my vocal chords seemed to take to it with ease. I never even had a touch of laryngitis. I don't think another year of it would bother me."

In 1937 the role of Mrs. Bramson launched the veteran actress on a film career with a

WHITTY, DAME MAY—*Continued*

performance which one critic called "a masterpiece that loses nothing in its transition from familiar stage to unfamiliar screen." Once before, in 1914, Dame May had appeared in a film, in the British-made *Enoch Arden* with Ben Webster and Gerald Lawrence. Since 1937 she has appeared on the screen in *Thirteenth Chair, The Lady Vanishes, Raffles,* the remake of *Bill of Divorcement, Suspicion, Mrs. Miniver, Slightly Dangerous, Lassie Come Home, Mme. Curie,* and others. (Most of the films were made under her MGM contract.) In 1945 she is a featured player in *My Name is Julia Ross,* in which, " a past master of the matronly facade hiding stark villainy," as Otis L. Guernsey, Jr., put it, she gives a "matchless performance." For her performance as Lady Belden in Mrs. Miniver she was nominated for an Academy Award, and in several of these films Ben Webster has played with her. Of the new medium Dame May said in 1938: "In a play you build brick by brick for your effect, slowly pyramiding to a climax, both in character and situation. In pictures you build bit by bit and these you do over and over again, first your close-ups and then for attitudes and camera angles. In a sense films are an unnatural medium, from the stage's point of view of logical development. It surprised me that I could step in after a lifetime of stage training, and have so little difficulty in portraying a character. I should have thought this was because I had already played the part on the stage if it were not that I played three other picture roles entirely new to me."

The 1945-46 season brought Dame May, now an octogenarian, again to the stage after an absence of five years. (She had last been seen as the nurse in Laurence Olivier's New York production of *Romeo and Juliet* in the spring of 1940.) *Thérèse* also marked the first professional alliance of May Whitty and Margaret Webster. In the early thirties mother and daughter had been associated non-professionally in a production of Thornton Wilder's '43 *The Long Christmas Dinner* for a Sunday night membership society in London; in August 1939 again in a tryout production of *Viceroy Sarah* for Bela Blau's theater in Deertrees, Maine; and in 1941 in the Experimental Theater's first production, Euripedes' *The Trojan Woman,* in which Margaret Webster both directed and acted the part of Andromache and Dame May played Hecuba. For this venture, recalls Margaret Webster, her mother, knowing how much she wanted "to establish the principle of experimental shows on the lines of the English membership societies . . . volunteered to come from Hollywood at her own expense to rehearse and play the tremendous part of Hecuba for two performances for nothing." In *Thérèse,* the Thomas Job adaptation of Emile Zola's *Thérèse Raguin,* Margaret Webster directs her mother (and Eva Le Gallienne '42 and Victor Jory) in what most of the critics considered a mediocre play but another May Whitty acting triumph, and a role which demands, in one entire scene, that Dame May "express herself only by the blazing hatred in her eyes." "Her performance" wrote Howard Barnes of the New York *Herald Tribune,* "makes this contemporary version of a theatrical antique something more than a clever and entertaining stunt. No matter what convolutions the plot takes in relating dark deeds, remorse and confession, she towers through the production with all the serenity she might have had in playing a great classic or modern tragedy. She quickens every scene of *Thérèse* with dramatic overtones which are not always discernible in the script." "She is so wonderful," said Burton Rascoe, "that tears of gratitude came into my eyes that I was privileged to see such art."

Since 1939 Dame May and Ben Webster have lived most of the time in Hollywood, where the actress is chairman of the British Actor's Orphanage and vice-president of the Los Angeles Branch of British War Relief. "In talking with the beloved couple," said one interviewer recently, "one gets the impression that their life together—their interest in the English children they have had brought to this country, their friends, the career of their daughter—all come before movie work. Wherever they go, they establish in their hotel rooms an air of hospitality with the inevitable teapot and cake and crumpets. They like to take quiet rooms overlooking a park. With typical English love for atmosphere and places, they can gaze for hours at a park whether it is covered in pale gray mist or splashed with sunshine. New York, says Dame May, has everything except fireplaces. Not near enough fireplaces. She loves America too—thinks its dentistry and architecture and fresh fruit are wonderful. But she doesn't understand women's clubs and is appalled by the funnies."

WILBY, FRANCIS B(OWDITCH) Apr. 24, 1883- United States Army officer

Address: c/o War Department, Washington, D.C.

In January 1942, when Major General Francis B. Wilby became wartime head of the United States Military Academy at West Point (known to the less rigorous Naval Academy as "Hell on the Hudson") he assumed command of a military school unique in the world. West Point is the only one in any major country, probably the only one in the world, which gives a full collegiate education, leading to a bachelor's degree as well as to an officer's commission. Another factor distinguishing the Academy from similar ones in other countries is that it is a general training school, rather than one for a specific branch of service; with one exception (Air Force officers), its graduates are expected to get such training at the special service schools, and, in as many cases as possible, at the Command and General Staff School, Army War College, and perhaps Army Industrial College. Still a third difference between the USMA and, for example, the Royal Military College of Canada and its British forerunners, is that West Point cadets are chosen from every class of society and are paid by the Government. To prevent any distinction by income, cadets are not allowed to handle any money, not even small change. (Oddly enough, the Japanese army training schools are similarly free and open to those physically and mentally qualified.) The thirty-ninth in a line of superintendents which includes Sylvanus Thayer, Robert E. Lee, and Douglas MacArthur '41, General Wilby was given the responsibility of directing the 143-year-old Academy during the Second World War.

Francis Bowditch Wilby was born in Detroit, Michigan, on April 24, 1883, the son of Richard Clark and Margaret Ann (Ingersoll) Wilby. *Who's Who in the Regular Army* gives his father's occupation as minister. After a year of study at Harvard University, eighteen-year-old Francis was appointed to the Academy from Massachusetts. At graduation in 1905, he stood third in his class, and as such was commissioned a second lieutenant in the Corps of Engineers. Wilby began service in September 1905 at Fort Leavenworth, Kansas. Next he worked on a survey in Wyoming; and after a pause at Fort Riley, Kansas, he sailed for four months' duty in Cuba, at the end of which, in June 1907, he was promoted to first lieutenant.

In September 1907, Wilby was sent to the Engineer School at Washington, D.C., from which he was graduated in 1908. After a land survey project in Rhode Island, he was stationed briefly at Washington Barracks, and then, in February 1909, went on duty in the Philippines. Wilby remained overseas for two years, including five months in Peking with the Military Information Division. Returning to Washington in March 1911, he was married that May to Dorothy Langfitt, whose father, William C. Langfitt, was an engineer lieutenant colonel in charge of river and harbor improvements and water supply. (The Wilbys have one son, Langfitt Bowditch.)

Wilby's second promotion, to captain, came in September 1912, when he was twenty-nine. At thirty-four he was a major, serving with the Ohio River Board in West Virginia; promoted one month after the United States declaration of war, he was raised again to the rank of lieutenant colonel (temporary) in August 1917, and sailed for France with the First Engineers. (At this time his father-in-law was General Pershing's AEF chief of staff.) After a short course at a French school, Colonel Wilby assumed command of the First Corps Engineer School. Leaving this post in February 1918, he was advanced to colonel (temporary) and assigned to the Office of the Chief Engineer overseas as assistant in charge of military operations. He spent five months there, another month at the front with the First Engineers, attached to the famous First Division, and then six months at Allied General Headquarters at Chaumont writing for and editing *Engineer Field Notes*. Wilby went to the First Army front in September and spent three weeks assisting the chief engineer in the Saint-Mihiel offensive. Then he was given command of the First Engineers and became division engineer, participating in the Meuse-Argonne offensive. Battles in which he participated include Cambrai and the Aisne-Marne. In all of these positions, Colonel Wilby "displayed unusual ability and professional attainments of a high order. . . . By his rare technical skill and knowledge, keen adaptability to all conditions, he contributed materially to the success of the First Division . . . in times and circumstances of the gravest importance," and was rewarded with the Croix de Guerre with Palm, the First Division's fourragère, and the Distinguished Service Medal with the citation quoted.

U. S. Army Signal Corps

MAJ. GEN. FRANCIS B. WILBY

After the Armistice, Wilby served with the American forces in Germany. Returning to the United States in March 1919, he served in the National Guard Bureau, and then in September was assigned to the Office of the Chief of Engineers. In June 1920 Wilby reverted to his permanent rank of major, and in late 1921 he entered the School of the Line at Fort Leavenworth. Graduated with honors in June 1922, the thirty-nine-year-old officer went right on to the Command and General Staff School and then to the Army War College at Washington—taking the Army's highest training at one sitting, so to speak. After graduation from the War College in June 1924, Major Wilby worked four years on the War Department General Staff. Then he was promoted to lieutenant colonel and sent to Memphis, Tennessee, where he remained three years, as district engineer in charge of river and harbor work on the Mississippi River. Back in the Office of the Chief of Engineers, Colonel Wilby served three years, to June 1935, as chief of the military division; and then went back to river and harbor work as chief of the Gulf of Mexico Division, stationed at New Orleans, and member of the Mississippi River Commission. In November 1938 the Colonel assumed command of the North Atlantic Division Engineers, with headquarters in New York City.

(Continued next page)

WILBY, FRANCIS B.—*Continued*

In October 1939 Wilby was designated chief of staff of the First Army, under General Hugh A. Drum['41], with headquarters on Governor's Island in New York harbor. A year later, when the Army was being expanded by the induction of draftees, he was made a brigadier general (temporary)—at a time when many outstanding generals of the Second World War were still wearing eagles and oak leaves on their shoulders. In this post, his "brilliant planning, remarkable ability for organizing . . . supplemented by resourcefulness and ingenuity" won him the Legion of Merit (awarded five years later, in March 1945).

In June 1941, General Wilby was given command of the First Corps Area, with headquarters in Boston, and that September he was made a major general. In January 1942, with the United States at war, Wilby relieved Major General Robert L. Eichelberger['43] as superintendent of the United States Military Academy—abbreviated officially as USMA, and informally as West Point or simply the Point.

"In theory," writes Henry F. Pringle in *Collier's*, "the Academy is run by the superintendent and his staff under the supervision of the War Department. Actually, I am convinced, it is run by a permanent group of officers called the Academic Board. This is composed of the heads of the various collegiate departments, [all colonels], the superintendent, and two or three other officers. Their devotion to West Point is sincere and complete. So, I suspect, is their control. I don't think any superintendent, whose assignment to the institution is normally for four years, would cross swords with the Academic Board [of which most members are appointed for life]. I doubt that the War Department would oppose its will." "Is West Point any good?" Pringle had asked in 1940, and answered himself, "That depends on what you want. If it is an institution which turns out men of honor, men of intelligence, men who believe in tradition, men who are brave—why then, West Point is very good indeed . . . If you want a West Point tuned up to immediate combat, to tanks and parachute troops and totalitarian efficiency and lightning thrusts and mechanization and horror and death—why then, West Point is not much good." This objection, which has been raised by others, arises partly from misunderstanding of or disagreement with the basic policy governing West Point—that it is, to quote *Life*, "a college for the training of next war's generals, not a training camp for this war's shavetails." Superintendent Eichelberger, however, began a program of modernization which was carried further under Wilby.

In 1942 Wilby invited criticism of the shortened curriculum from a board of consultants which included Ernest M. Hopkins['44] and Karl T. Compton['41], the presidents, respectively, of Dartmouth College and the Massachusetts Institute of Technology. The board reported that it was "greatly impressed by the thoroughness of the instruction, the alertness of the students, and the excellence in balance between the discussion allowed the students . . . and the more formal aspect of recitation and instruction. . . . There is no justification for the popular conception that West Point instruction is rigid, sterotyped, and regimented." In August of that year, 1942, Stewart Field, the "Wings of West Point," was dedicated; and although "still in the turmoil of excavation, grading, and building," it went into immediate operation. Since then, to quote the commanding officer, "Flying instruction continued, flying officers were graduated, and flying in general proceeded normally even though contractors, heavy trucks, shovels, and graders were as numerous as planes on the airfield scene." At Stewart, which is larger than New York's LaGuardia['40] Field, certain enlisted men were trained; all cadets were required to fly at least five hours as air observers; and those cadets who chose to specialize in flying were given a complete and rigorous training. "Of the 514 officers who graduated from the Military Academy on June 1, 1943, there were 206 who wore the silver wings of the Army Air Forces. These were the first men to wear wings earned in training received entirely at Stewart Field." "In order to spare the time for the necessary hours of advanced flying training," General Wilby explained, "this class took a concentrated one-month course covering academic subjects for the entire year. These included military history, economics, government, law, ordnance, and some engineering." Another long-standing need was met in June 1943, when construction was finished at Camp Popolopen, "several thousand acres of rugged country" adjoining the Academy grounds.

In September 1945 Wilby was made commanding General of Fort Belvoir, Virginia. Toward the end of the year it was announced that the General was planning to retire early in 1946.

WILCOX, HERBERT *See* Neagle, A. and Wilcox, H.

WILSON, EDMUND May 8, 1895- Critic; author

Address: b. c/o The New Yorker, 25 W. 43d St., New York City

Edmund Wilson, author of several distinguished books of social and literary criticism, has for several years been considered one of America's leading critics. He has been called the foremost "intellectual's intellectual" in the United States, his reputation overshadowed only by that of T. S. Eliot. Dissenting opinion has termed him negative rather than dynamic, "of the second order of attainment rather than the first," accused him of confusions and reversals of judgment. In answer to this, his admirers have upheld him as "independent" and "a character in continuous evolution."

Edmund Wilson, who has called himself a "typical specimen of the current American bourgeoisie," was born in Red Bank, New Jersey, May 8, 1895, the son of Edmund and Helen Mather (Kimball) Wilson. His family for several generations on both sides belonged to the learned professions. None were rich, but all were comfortably well off. His grandfather's family, of Puritan stock, had emigrated from Massachusetts to Talcottville in upstate

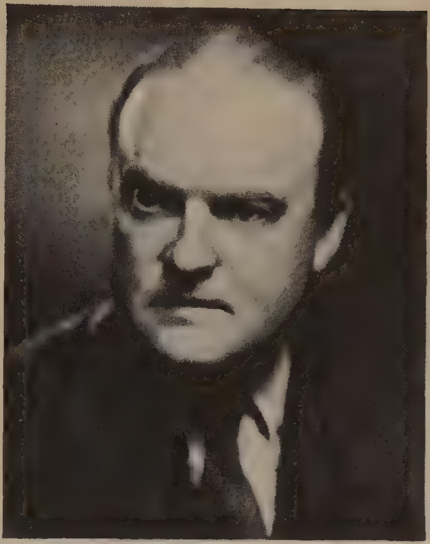
New York, where the Wilson children used to go for summer vacations.

Edmund's father was a lawyer, at one time Attorney General of New Jersey, whose independence and "distrust of big business" confined his practice to local clients. The boy grew up in moderate prosperity: "I have been put through the same sort of mill as all the other young bourgeois Americans of my generation," he says. He went to Hill School, Pottstown, Pennsylvania from 1909 to 1912. "At boarding school and college," he writes, "I used to react violently against this mill, but except by expressing heretical opinions I never tried to revolt against it." His literary and critical talents were early evident. He was one of the editors of the school magazine, and later edited the literary magazine at Princeton University, which he entered in 1912. At Princeton (he took his B.A. there in 1916) his close friends were F. Scott Fitzgerald and the poet John Peale Bishop.

After his graduation the young man went to New York to work and to write. There he became a reporter on the New York *Evening Sun* (1916-17), but, he has said, "It seemed to me that my life in New York was college all over again." Consequently, when the First World War broke out, he enlisted. "Not because I cared much about the war," he says, "but because—aside from the social pressure—I wanted to get away from my old life." For this reason, too, he enlisted as a private instead of going to an officers' training camp, as most of his friends did. Although he disliked Army life intensely, he felt that his relations with others at least were real in a way they had not been in school and college. He served in France with Base Hospital Unit 36, and with the Intelligence Corps from August 1917 to July 1919. "One day in France, sick in bed," he tells, "I swore to myself that when the war was over I should stand outside society altogether. I should do without the comforts and amenities of the conventional world altogether, and I should devote myself to the great human interests which transcend standards of living and convention: Literature, History, the Creation of Beauty, the Discovery of Truth."

After the war Wilson returned to New York to become managing editor of *Vanity Fair* (1920-21). With John Peale Bishop he wrote *The Undertaker's Garland* (1922)—satiric and humorous descriptions of deaths and funerals, written in both verse and prose. "Nothing in the book," wrote Gilbert Seldes ['41], "gives evidence of haste or indolence or contempt for the practiced art."

In 1926 Wilson joined the editorial staff of the *New Republic*, writing for the book review section. He resigned as an associate editor in 1931 to devote himself to his own writing, but remained as a contributing editor. He had, meanwhile, published three books. In *Discordant Encounters* (1927), a group of plays and dialogues concerning the battle between the old and the new in our social forces, Clifton Fadiman ['41] discerned "wit and lucidity and sweetness." A book of lyrics with a few prose sketches, *Poets, Farewell* (1929), won little attention, but some praise for its "swift, slashing satire."



EDMUND WILSON

By 1931 Edmund Wilson had turned his attention to social and literary criticism. While some reviewers have felt that his viewpoint and conclusions with regard to social criticism have been less objective, less consistent than his work in the field of letters, his study of social, economic, and political happenings has contributed a background of understanding to the work of contemporary writers. In his preface to *Axel's Castle* (1931) he stated his ideas of what literary criticism ought to be: "A history of man's ideas and imaginings in the setting of the conditions which have shaped them."

Axel's Castle established Edmund Wilson as one of America's important literary critics; Henry Hazlitt said that the book was "destined to exercise a deeper influence on American criticism than any volume since *A Book of Prefaces*" (Mencken, 1918). With "an intelligence that is alert, informed, and catholic to a degree rarely found in contemporary criticism" (William Troy in the *Nation*), Wilson's essays in this volume were studies of the effect of the Symbolist movement on Yeats, Valery, T. S. Eliot, Proust, Joyce, Gertrude Stein, Villiers de l'Isle-Adam, and Rimbaud. Symbolism, a reaction against naturalism, first appeared in poetry: each poet sought the special language or symbols peculiarly suited to his individuality. Poetry, indeed, became so much a "private concern" that it was often incomprehensible to the reader.

The American Jitters—a Year of the Slump (1932), the first of Wilson's social surveys, covered the months from October 1930 to December 1931. It was in the main a study of moral and ethical standards in the United States during the depression. The author discovered that "class antagonism, conflicts, and injustices are real, that they rarely get any publicity, that the class on top virtually controls the organs of publicity, that the capacities of human nature for remaining blind to the consequences of its actions where its comfort and prestige are concerned are so great that it cannot usually be induced even to notice what it is up to without a violent jolt from below, and that there is no hope for genuine decency and fair play

WILSON, EDMUND—*Continued*

except from a society where classes are abolished." For these reasons, Wilson concluded, there was not much hope for a "liberal" solution. He turned instead to Russia, where he saw "a great new movement of creative thought and culture in a classless society." He admired the Russian leaders because they "are men of superior brains who have triumphed over the ignorance, the stupidity, and the shortsighted selfishness of the mass." He advised writers that it was bad for their art to try to adapt themselves to capitalism, the enemy of art; that it was healthier for them to contribute their talents to Communist aims than to be content to express a purely personal viewpoint.

Growing enthusiasm for Russia took Edmund Wilson on a visit to that country from May to October 1935. His impressions were set down in his book, *Travels in Two Democracies* (1936). A study in contrasts, the first part was a continuation of the American scene during the depression years. The Russian half of the book was considered by such critics as Malcolm Cowley "more favorable to the Soviets than anyone would guess from the separately printed extracts." Edmund Wilson liked the Russian people: "It is much easier to establish friendly relations with Russians than with the people of any other country I know." In the cities he found the people badly dressed, but earnest and enthusiastic. "The crowds moved . . . as if the whole city belonged to them." Wilson was much impressed, too, by the prestige which literature and writers commanded. "Literature is one of the things for which the Russians have a special national genius. . . .Nowhere else in the world does a writer receive so much honor."

One trying but illuminating experience was the six weeks Wilson spent, ill with scarlet fever, in a free but poorly kept hospital in Odessa. The attendants were courteous and kind, but, he discovered, if one wanted anything done, he "had to go to a Communist for action." The strongest impression he got in Russia was "one of extraordinary heroism. . . . You feel you are at the moral top of the world where the light never really goes out." Many critics felt that America, pictured too darkly, came off second best in the study of the two democracies. "It is assuredly not a fair comparison of the systems and the countries," wrote R. L. Duffus.

Back home, Wilson turned to literary concerns again. *This Room and This Gin and These Sandwiches* (1937), a book of three "experimental" plays, was followed in 1938 by *The Triple Thinkers*. These essays included an attack on the critic Paul Elmer More; a discussion of verse as a "dying technique"; a eulogy of the Russian poet Pushkin; an analysis of the work of Henry James; praise for Shaw '44 as a dramatist, but not as a social and political philosopher; and a concluding essay on Marxism and literature. In the latter Wilson reversed his former dicta, including some of the statements made in *Travels in Two Democracies*. There was literature in the Soviet Union, he now said, when "Lenin and Trotsky worked sincerely to keep literature free." But, under Stalin '42, "unliterary and uncultured himself," literature was "a means of manipulating a population." The practice of the deliberate falsification of social and political history "has attained fantastic proportions." Harold Strauss found *The Triple Thinkers* "stimulating from cover to cover," while T. C. Wilson felt that "Mr. Wilson has spent his time trying to prove a thesis which both the examples he cites and the more representative ones he ignores, refute. For critical inquiry and judgment he has substituted the easier labors of irresponsible prophecy."

During the middle 'thirties there were indications that Edmund Wilson's readers were discovering conflict, contradiction, and change in his social, political, and literary judgments—a reversed political viewpoint reflected in his various writings. In 1932 he had greatly admired the Russians, had found Stalin "running Russia fairly and sensibly." In 1937 he declared that "one of the worst drawbacks of being a Stalinist is that you have to defend so many falsehoods." Among those intellectuals who, like himself, were undergoing disillusionment with regard to Russia's role in world affairs, Wilson was praised for his "integrity of character, his refusal to swallow any political faith or formula." Other critics expressed themselves less certain of the stability or independence of his judgments. Wrote John Abbot Clark: "In view of Wilson's critical confusions, his about-faces . . . his exhortations first to this and then almost immediately to its diametrical opposite, many of his readers have just about given up all expectations of finding in his writings either 'an intelligent basis of taste' or 'an intelligible point of view.' "

To the Finland Station (1940) was a study of the European revolutionary movement: its beginnings with Vico and Michelet; its decline in Renan, Taine, and Anatole France; its socialistic period with Babeuf, Saint-Simon, Fourier, and Owen; its theoretical apogee in Marx and Engels; its anarchist deviation in Bakunin; its activist phase in Lenin and Trotsky. Wilson upheld Trotsky as "the successor of Lenin, pursued from country to country, hounded and persecuted," and bitterly condemned the Stalin regime. "We have seen the State that Trotsky helped to build in a phase combining the butcheries of the Robespierre Terror with the corruption and reaction of the Directory." Said Lewis Gannett '41: "As brilliant and muddled a book as one may meet." Louis Hacker found it "the most discerning guide to the faith and vision of communism that we have." Howard Mumford Jones called the work "ponderous and even sluggish. For once Mr. Wilson is erudite and solid rather than erudite and brilliant."

Leaving Russia, Wilson turned to the California group of American writers, *The Boys in the Back Room* (1941). Of this group, which stemmed "originally from Hemingway," he found James M. Cain the best. John O'Hara '41 was less successful, his *Pal Joey* being "a little amoeba-monster." Saroyan '40, he said, also derived from Hemingway (Saroyan in an essay later denied this, saying his influence was Shaw), that he had real merit, but must avoid the danger of becoming merely a columnist. He praised Hans Otto Storm's earlier work; found Nathanael West the first writer to catch "the emptiness of Hollywood" and to "make this emptiness horrible"; said that F. Scott Fitzgerald had written before his death "a substantial part of what promised to be by all odds the best novel ever devoted to Hollywood." Wilson found in Steinbeck '40 only one thing constant: his "preoccupation with biology," his presentation of life in animal terms, which was at the bottom of his relative unsuccess in representing human beings. Clifton Fadiman praised in particular this essay as an "illuminating job of literary criticism."

The Wound and the Bow (1941) had the best critical reception of any of Wilson's books since *Axel's Castle*. "Seven of the most resourceful, and among them four of the best essays that Mr. Wilson has yet written," and "its solid virtues will enhance his fame as one of the best literary critics now writing," were among the comments. The book's title was derived from the legend of Philoctetes, who was equipped with an invincible bow, but also handicapped by an incurable wound. From this premise Wilson psychoanalytically interpreted the dualism of certain writers: Dickens and Kipling at length; with briefer glances at Casanova, Edith Wharton, Hemingway, and Joyce.

A collection of verse and some prose pieces, *Notebooks of Night*, appeared in 1942. Robert Penn Warren said the verses were of "uneven quality," with patches of conventional and sentimental writing, but Mary Colum, one of Wilson's most unwavering admirers, considered "practically every poem" in the volume interesting. John Chamberlain '40 found the prose pieces adept: "Mr. Wilson's subconscious mind is prolific of strangely beautiful stuff." In 1943 Wilson edited an anthology, *The Shock of Recognition*, pieces selected to show the development of literature in the United States, excluding all criticism and comment "which is not written by men who themselves have contributed to our literature." In 1945 he edited a volume of Scott Fitzgerald's unpublished sketches, notebooks, letters, and doggerel, entitled *The Crack-Up*, which Wilson characterized as "an autobiographical sequence which vividly puts on record his [Fitzgerald's] state of mind and his point of view during the latter years of his life." Wilson's *Memoirs of Hecate County*, a book of short stories, was announced for publication early in 1946.

In January 1944 Edmund Wilson succeeded Clifton Fadiman as literary critic of the *New Yorker*. Fadiman's urbane wit and ebullient brilliance had set a precedent which, some readers felt, would be difficult for any incoming critic to match. Characteristically, Wilson made no effort to give *New Yorker* readers what they thought they wanted. He meant to say exactly what he wished to say about a book, whether a best seller or by a little known writer. In his first three reviews he dismissed with firm scorn Harold Nicholson's *The Desire To Please*; he found *Cannery Row* the one book by Steinbeck he most enjoyed; he called Joyce's *Stephen Hero* "the most important document on Joyce's life yet made public."

Best sellers in general throughout 1944 were to feel the Wilsonian ax: Kay Boyle's '42 *Avalanche*, "nothing but a piece of pure rubbish"; of Louis Bromfield's '44 *What Became of Anna Bolton*: "He has gradually made his way into the fourth rank, where his place is now secure." He had good words, however, for Van Wyck Brooks's '41 *The World of Washington Irving*, Joseph Wood Krutch's *Samuel Johnson*, and Jan Karski's *Story of a Secret State*. Wilson occasionally singled out for comment work by writers almost unknown. Anaïs Nin's '44 book of experimental surrealist short stories, *Under a Glass Bell*, printed by the author herself, he praised as "really beautiful little pieces." Salvador Dali's '40 *Hidden Faces*, however, he called "one of the most old-fashioned novels that anybody has written in years."

In his *New Yorker* department Wilson aroused the greatest reader interest through his series, *Why Do People Read Detective Stories?"* The first of these, condemning detective fiction, including that of Rex Stout, Agatha Christie '40, Ngaio Marsh, Dorothy Sayers and Dashiel Hammett, brought letters, he says, "in a volume and of a passionate earnestness which had hardly been elicited even by my occasional criticism of the Soviet Union." Most of these mystery fans said he had not read the right ones. Their preferences were most divergent, but Dorothy Sayers was at the top, whereupon Wilson read *The Nine Tailors*: "It seems to be one of the dullest books I have ever encountered in any field." Bernard De Voto '43 (in *Harper's* for December 1944) lamented Wilson's "patronizing and academic approach: Will Mr. Wilson be so good as to stop asking Mr. Stout to be Proust?" Wilson went on to criticize Ngaio Marsh, "whom Mr. De Voto says writes excellent prose. . . .This throws for me a good deal of light on Mr. De Voto's opinions as a critic." His final conclusion: The reading of detective stories is simply "a kind of vice that . . . ranks somewhere between crossword puzzles and smoking. . . .There is no need to bore ourselves with this rubbish." Toward the end of the controversy he admitted that he had turned his attention to A. Conan Doyle and had succeeded in finding pleasure in Sherlock Holmes because it is "literature on a humble but ignoble level, whereas the mystery writers most in vogue are not."

The critic-author is described as quiet, shy, absent-minded, as having reflective brown eyes under a wide brow, and a small, gentle mouth. In 1938 he was married to Mary McCarthy, his third wife, also a writer and critic, whose reviews and articles have appeared in the *Nation* and other periodicals. They have a "polysyllabic" son, Reuel, and live in a Cape Cod house in Wellfleet, Massachusetts.

WILSON, EUGENE E(DWARD) Aug. 21, 1887- Aircraft executive; author

Address: b. United Aircraft Corp., East Hartford, Conn.; h. 1844 Albany Ave., West Hartford, Conn.

The aviation executive, Eugene E. Wilson, who is author of *Air Power for Peace* (1945), believes that the world is on the threshold of the "Age of Flight." As vice-chairman of the United Aircraft Corporation and president of the Aircraft Industries Association, he is a leading spokesman for the American aircraft

John Haley

EUGENE E. WILSON

industry. In 1930 Wilson terminated a twenty-five-year naval career, which had covered the pioneering stages of naval aviation, to enter the manufacturing field of aeronautics. He has since been associated with significant engineering developments, including the controllable pitch propeller, the two-seat dive bomber, the long-range fighter-bomber, and the high-powered, air-cooled radial engines.

Eugene Talmadge and Clara (Pomeroy) Wilson were pioneers of the Northwest who finally settled in the small town of Dayton, Washington. There, on August 21, 1887, their son Eugene Edward Wilson was born. Eugene and his father, who was a great sportsman, were "inseparable in and out of doors." When the boy was ten the family moved to Helena, Montana, where he spent the summers on a ranch, learning to handle a rifle and absorbing the spirit of the old West. During this period he became a photography enthusiast, using the then new Brownie camera for nature studies.

In 1902 the Wilsons moved back to Seattle, where Eugene Wilson made the acquaintance of Captain Dorr F. Tozier of the United States Revenue Cutter Service. As the Captain's summer guest, the young man cruised in the waters of Puget Sound and southeastern Alaska. Wilson believes that this experience influenced his choice of a career, for, upon graduation from the Seattle High School in 1904, he entered the United States Naval Academy at Annapolis. "I felt a Western boy should go East and vice versa, and this looked like a good school," he has remarked. At Annapolis Wilson joined the rifle team, which won the national championship at Camp Perry in 1909. His class was the last required to go to sea for two years as passed midshipmen before being commissioned as ensigns. In the class were three candidates named Wilson, which caused confusion in the records of the promotion examination, and Eugene Wilson was left off the list of those passing. But this was quickly corrected; he was graduated twenty-first in a class of two hundred and twenty, and awarded the "Class of 1871" prize sword for excellence in practical and theoretical ordnance and gunnery.

Wilson joined the destroyer flotilla, in which he was soon given command of the *Truxton.* But in 1913 he was ordered to Annapolis for postgraduate training, after which he attended Columbia University. There he studied engineering under Charles Edward Lucke, who, says Wilson, "set out to teach us to think." After winning his M.A. in 1915 (Columbia gave no scientific degrees at that time), Wilson was assigned to the *Arkansas.* In short order he became the ship's chief engineer, in which capacity he developed a new system of distilling sea water through waste auxiliary exhaust steam. This economical process gained wide usage, but its inventor narrowly escaped punishment for "unauthorized alteration of the power plant."

During the First World War Wilson served in the United States Sixth Battle Squadron of the British Grand Fleet and was present when the Germans surrendered to this unit at Rosyth on November 21, 1918. His book of verse, *Comrades of the Mist and Other Rhymes of the Grand Fleet,* was published early in 1919. On his return from the war zone that year the officer was given command of the Aviation Mechanics School at the Naval Training Station at Great Lakes, Illinois. Here he met Captain William A. Moffett, who was determined to organize a bureau of aeronautics in the Navy Department and invited Wilson to join him in the project in Washington. The latter, however, had to complete a tour of sea duty, and through Moffett's intercession was assigned to commission the *Wright,* a new "kite balloon and seaplane tender." For a year and a half he cruised with the naval air force in the Caribbean. Then, in June 1922 Wilson was assigned to the United States International Rifle Team to participate in the international matches in Italy the following September. The team won the world championship. Commenting on this experience, Wilson says, "I learned here, however, that the last thing we can expect to accomplish from international sports competition is international friendship. Only the fear of spoiling the score prevented some of the competitors from wasting a few record shots on each other."

Two years after the Navy's Bureau of Aeronautics was created, Wilson in 1924 was appointed chief of the engine section by Moffett, now an admiral. He was called upon to do some writing for the Admiral, who, according to Wilson, "never did read any of the articles or speeches prepared for him but let us know that if it turned out all right that was one for him, but if it turned out wrong that would be too bad for us." During this period Wilson was instrumental in the development of the air-cooled radial engine, which had been considered by many an impossible task. But with Admiral Moffett's support, Wilson's program was carried through successfully, illustrating again, he believes, the effectiveness of competitive private industry. For several years Wilson had been anxious to train as a naval aviator, although he was beyond the age limit of twenty-eight. He finally requested sea duty, but, when such orders were issued, Admiral Moffett, instead of releasing him for this, granted him two months' leave in which to qualify as a pilot, with the provision that he remain in the Bureau afterward. In those two months in 1926 Wilson completed the nine months' course at the Naval Air Station at Pensacola, Florida, including over a hundred hours of student solo flying, and became a naval aviator at the age of thirty-nine.

Having earned his wings, he returned to the Bureau, to be put in charge of the design section. At this time the half-finished battle cruisers *Lexington* and *Saratoga*, which Moffett had "salvaged" from the Washington Disarmament Conference, were being converted into aircraft carriers. Wilson was responsible for developing new airplanes around new engines for these vessels. When the work was in progress he was appointed chief of staff to Admiral J. M. Reeves, commander of the battle fleet's aircraft squadrons. Wilson soon qualified for his deck landings and then proceeded to assist in the organization, training, and development of the carrier squadrons. Participating in broad naval operations, Wilson reports, "We were able to run the gantlet of the entire Atlantic and Pacific fleets with the *Saratoga* and attack the Panama Canal from one hundred and fifty miles at sea." This operation "represented the first application of the carrier-cruiser task force idea and the utilization of aircraft as the long-range striking force."

Wilson's next assignment came in May 1929, when he became aviation aide on the staff of the commander in chief of the battle fleet. The following fall Commander Wilson was offered the presidency of the Hamilton Standard Propellers Corporation, a subsidiary of the United Aircraft and Transport Corporation. Surprised by the offer, the naval officer was initially inclined to disregard it, but he says, "The more I thought about it the more I wondered if this lack of interest did not signify an unwillingness to give up the security of a naval career in exchange for the hazards of civil life." But he finally accepted the position, "more in a spirit of bravado than from rationalization," he admits, adding, "some of this may have come down from the pioneers." Upon assuming his new position with the Pittsburgh aircraft concern in January 1930, Wilson encountered "tough sledding" at the outset of the depression. He decided to undertake the development of a new propeller which had been patented by Hamilton's chief engineer, Frank W. Caldwell. Despite active opposition, this project was successful and won for Caldwell and the company the coveted Collier Trophy for achievement in aviation for the year 1933.

When Wilson accepted the presidency of another United subsidiary, the Sikorsky '40 Aircraft Company, in the summer of 1930, he was again faced with a precarious industrial situation. The company suffered losses when it built the first three Clippers (S-40's) for Pan American Airways, and got in serious financial straits. Wilson suggested a study of a new high performance plane designed around the new controllable pitch propeller. Such a project was begun, and culminated in the S-42 Pan American Clippers which made pioneer Atlantic and Pacific crossings. With the death of the head of the Chance Vought Corporation, Wilson assumed leadership and was thus president of three of United's subsidiaries. When this last company was reorganized, it built the first two-seat dive bomber and eventually produced the Corsair fighter-bomber. These aircraft, based on Wilson's fleet operating experiences, proved their value. By 1937 Wilson was senior vice-president of United Aircraft and had begun developing a research division. (In the April 1944 issue of *Aeronautical Engineering*, Caldwell, then United's director of research, discussed the vast engineering and technical work conducted under the company's four operating divisions [Pratt & Whitney, Hamilton, Chance Vought, and Sikorsky].) In 1945 Wilson considered that the organization period for the research division was practically at an end.

When the president of the company became ill in 1939 Wilson became acting chief executive, and with the death of the former the next year he was elected president. He was thus to head the aircraft concern during most of the period of acceleration brought about by the war, when the company reached its peak of production. Late in 1943 the executive relinquished the presidency to devote himself to the duties of vice-chairman. He foresaw probable threats to the aircraft industry with the end of the war, and in 1944 he and other leaders of the industry reconstituted the Aeronautical Chamber of Commerce and issued a statement of policy. As chairman of the organization's Board of Governors, the former naval man played a prominent part in the formulation of its policies. In April 1944 their recommendation for American air power policy was issued. The resolution states that "The United States should maintain an air power sufficient not only to win this war but also to keep the peace: 1) by maintaining adequate air forces at such strength and in such state of readiness as to preclude a successful assault upon our country or its possessions; 2) by acquiring and maintaining air bases essential to our security and that of overseas trade; 3) by facilitating the orderly and economic expansion of domestic and international air transport and of private flying; 4) by preserving a strong aircraft manufacturing industry." Wilson, in testifying before a subcommittee of the Senate Military Affairs Committee in July 1944, stressed the industry's desire for an air power policy, and recommended new legislation "restating as national policy the principle of advancing technological development of aviation through competitive private industry."

In response to what he termed "a crying need for a specific analysis of the role of air power in world affairs, based upon its history," the industrialist wrote *Air Power for Peace*, which was published in April 1945. Summarizing the history of American aviation between two wars, the work details the author's two major concepts: "One, the trinity of air power comprising air force, air commerce, and aircraft industry, and, two, the broad new concept of the economics of air power and its potentialities with respect to the peace." Pronounced in general by critics "a book of merit," the volume was called by the reviewer for *Aviation News* "delightful and solidly informative reading." In his review in the *Book-of-the-Month Club News*, Brigadier General Donald Armstrong wrote: "With notable economy of space, in a language intelligible to the layman, he [Wilson] describes the nature, purpose,

WILSON, EUGENE E.—*Continued*

and use of air power in war and peace. . . .His analysis . . . is a welcome example of objective thinking and reasoning in a field too often disturbed by excessive enthusiasm." Commander A. F. Bonnalie in *U. S. Air Services* commented: "For the first time it makes it possible for the layman to grasp an understanding of the most potent power of this age . . . it is not light reading; on the contrary it is strong medicine, vital thought-provoking comments abound in its pages." According to another critic, in *Air Power for Peace* Wilson "reaches beyond the horizons of most thinkers on the arts and problems of flight."

In May 1942 the executive delivered the commencement address at Trinity College, which awarded him an honorary Doctor of Science degree. In December 1943 he again served as a commencement speaker, this time at Rensselaer Polytechnic Institute, and was awarded an honorary Doctor of Engineering degree. Wilson's articles have been published in *Aviation, Popular Mechanics,* and *Flying.* His addresses to the Union League Club of Chicago and the Economic Club of New York have been reprinted in *Vital Speeches.* In a radio address on August 29, 1945 he predicted an 80 per cent reduction in the size of the aircraft industry and again called for "a definite public policy on production and development of research." Wilson has wide business connections; he is a director of the Hartford Electric Light Company, the Hartford National Bank and Trust Company, the Aetna Life Insurance Company, and the Southern New England Telephone Company. A Republican, the executive is president of the Aircraft Industries Association of America and the Navy Industrial Association. He is a fellow of the Royal Aeronautical Society of Great Britain, a member of the Institute of Aeronautical Sciences and the American Society of Naval Engineers. His clubs are the Army and Navy (Washington, D.C.), the Hartford Golf Club, Anglers', the Clove Valley Rod and Gun Club, and the New York Yacht Club.

Mrs. Wilson is the former Genevieve Speer of Illinois, whom he married on February 7, 1911. Still an eager photographer, Wilson uses principally 16mm kodachrome. He combined his out-of-doors interests with photography in 1942 when he wrote an article for the *National Geographic* about a favorite fishing haunt, illustrated by his pictures. Entitled "Anticostia Island, Nugget of the North," it is the story of a privately owned island at the mouth of the St. Lawrence River which has served in succession as "an explorer's reward, a pirate's stronghold, a rich man's social experiment, a pulpwood empire, and a sportsman's paradise." "I have found that I need to get in among the trees and relax in order to see the forest," he has said. In reflecting upon a career which has included revolutionary developments in aviation, Eugene Wilson asks, "What better pioneering could a man ask?"

WOODHOUSE, (MARGARET) CHASE GOING 1890- United States Representative from Connecticut; economist; educator

Address: b. House of Representatives Old Office Bldg., Washington, D.C.; h. 751 Williams St., New London, Conn.

Of the three new women Representatives (all Democrats) whom the voters sent to the Seventy-ninth Congress of the United States, Chase Going Woodhouse of Connecticut's Second District is generally described as the most politically experienced. As a college professor on leave, she may also be said to have the greatest theoretical background. Her election, concurrent with that of Emily Taft Douglas '45 of Illinois, causes the Nutmeg State to share with Illinois the title of first state to have two women Representatives in Congress at the same time.

The only child of Harriet (Jackson) Going and Seymour Going, a prominent mining and railroad man of Alaska and the Canadian Northwest, Margaret Chase Going was born in 1890 on Canadian soil, in Victoria, British Columbia. After graduation in 1908 from Science Hill School at Shelbyville, Kentucky, Chase Going returned to Canada to study at McGill University, where she received her B.A. degree in 1912 and her M.A. the following year. After graduation she began her social work. The young economist went to Germany for advanced work at the University of Berlin (she has also studied in England), returning after the outbreak of the First World War to continue at the University of Chicago. When the United States entered the war in April 1917, Miss Going was a fellow in political economy at the university. That June she was married to Edward James Woodhouse, a professor of government.

While Professor Woodhouse was in the United States service his wife was an instructor at Smith College, where one of her students was a future Congressional colleague: Jessie Sumner '45 of Illinois. In 1918 Mrs. Woodhouse was advanced to assistant professor of economics, and in 1920 to associate professor. She also began to teach during the summer at the Smith School for Social Work. Her two children were born during this period: Noel Robert Seymour in September 1921, and Margaret Wark in January 1925. Later that year Mrs. Woodhouse joined the Department of Agriculture staff as senior economist in charge of the Bureau of Home Economics' Division of Economics. She continued her summer school work, and has taught at the universities of Oregon, Texas, and Iowa, the Vassar Institute of Euthenics, and the Teachers College of Columbia University, as well as at Smith.

After three years in the Civil Service, Mrs. Woodhouse became in 1928 the director of personnel at the Woman's College of the University of North Carolina. With Mrs. Jouett Shouse, formerly of the Department of Labor, she founded the Institute of Women's Professional Relations to study the status of working women and the needs of employers and to keep the students and colleges posted on curriculum needs. As managing director of the institute, Mrs. Woodhouse has had to meet a payroll every month since 1928, as her campaign posters were later to point out. She also edits the institute's various technical studies and survey results and the quarterly publication, *Women's Work and Education.*

In 1929 and 1930 the Canadian-born professor was also North Carolina State chairman of research for the Federation of Business and Professional Women's Clubs. In that year of 1930 a bibliography Mrs. Woodhouse had compiled was published, followed two years later by *After College—What?* and in 1934 by *Dentistry, Its Professional Opportunities.* From 1932 to 1933 Mrs. Woodhouse served as vice-president of the College Personnel Association, and from 1933 to 1937 she was the national president of Altrusa Clubs, in which connection she has twice made trips to Mexico. She was also active in the League of Women Voters, the American Home Economics Association, and the American Sociological Society, and contributed to various professional journals.

In 1934 Mrs. Woodhouse left the University of North Carolina to become professor of economics at Connecticut College. She continued her interest in the Southern Women's Educational Alliance, however, and became a board member as well as being elected to the board of the Carnegie Foundation's National Occupational Conference. In that year, too, she and Mrs. Shouse began the annual Institute of Women's Professional Relations conferences in Washington, at which employers and Government representatives meet with educators and students, and which have made her a familiar figure in the Capital. From 1936 to 1937, and again from 1938 to 1939, the economist was fellowship chairman of the Rhode Island-Connecticut Federation of the American Association of University Women. Her *Business Opportunities for the Home Economist* was published in 1938.

Two years later Mrs. Woodhouse, who was president of the Connecticut Federation of Democratic Women's Clubs, ran for Secretary of that State and was elected with the highest majority of any State official, assuming that office in 1941 for a two-year term. State secretaries keep the official records and are considered "nice guys who sign papers for everybody and make no enemies." The white-haired Madam Secretary added a new wrinkle: as the running of elections was one of her duties, she instituted "election law schools" in the interest of public information. She also became chairman of the New London Democratic Town Committee. When the National Roster of Scientific and Specialized Personnel was organized, Mrs. Woodhouse was named as consultant, to recruit and place women specialists in essential positions. She served in addition as State chairman of the Minimum Wage Board for the beauty industry, and was chosen to arbitrate a textile mill dispute. At the time when the first War Labor Board panel was set up in Connecticut, Chase Going Woodhouse was chosen to represent the public, and became panel chairman. She was also associate State administrator of the Treasury's War Finance Committee. These services the Professor continued on the expiration of her term as Secretary of Connecticut, when she was succeeded by a Republican woman, Frances B. Redick.

CHASE GOING WOODHOUSE

Mrs. Woodhouse resumed full-time work at Connecticut College, also preparing *The Big Store* for publication in 1943. In the year of 1944 she "made a bid for the Democratic Senatorial nomination, but was picked to stand for the House." Opposing the Republican incumbent, John D. McWilliams, in "a district the Republicans had counted as certain," she had the support of the Political Action Committee and the A.F. of L. The latter described the candidate as "one of the most liberal-minded women in Connecticut." "The main issue in this campaign," the nominee declared, "is how we shall set up some sort of a world organization that will make permanent peace possible." Other points she stressed were: that full employment could be maintained in peacetime "if we convert rapidly enough and keep wages up"; and "the necessity for a revision of the tax system; for working out allocation of fields between the state and the Federal Governments in the light of present-day conditions; the need for educational facilities, especially in the small towns; the need for further rural electrification." She stated her belief, moreover, that "the Congressman should be in the district every two weeks or so and available not only for private interviews but to conduct open forums on the bills before the Congress and upon matters of interest." And she won, in an election "upset," by 63,013 votes to 59,973.

(Continued next page)

WOODHOUSE, CHASE GOING—*Cont.*

Elected to the Congress from the Second Connecticut District, which includes sixty-four towns, the new Representative took a leave of absence from Connecticut College to join the lone woman on the Democratic side of the House, Mary Teresa Norton '44 of New Jersey. At this time her son Noel was an Army Air Force lieutenant (he had enlisted on the twenty-fifth anniversary of his father's enlistment in 1917); her daughter Margaret was studying, and her husband teaching at the University of North Carolina. (Also added to the Democratic roster were the two Mrs. Douglases: Helen Gahagan '44 of California and Emily Taft of Illinois.) At the Democratic caucus, the gentlewoman from Connecticut was appointed to a major standing committee, Banking and Currency, on which her former pupil Jessie Sumner was a minority member with three terms' seniority.

"I have no illusions of what a new member of Congress can do the first year," she told reporters. "I'm going to evaluate every piece of legislation in terms of how many jobs there will be after the war. Feed them first and reform them later!" On the first roll-call votes of the new session, Mrs. Woodhouse said "Nay" to the Rankin '44 proposal to make the (Dies '40) Committee on un-American Activities a permanent standing committee, and she voted with the majority for the May '41-Bailey '45 bill, empowering local draft boards to order into essential industry all non-servicemen aged eighteen to forty-five; also for the bill to give insurance firms four years exemption from the Antitrust Act provisions; and against recommitting the George '43 bill, which action would have blocked the appointment of Henry Wallace '40 as Secretary of Commerce.

Mrs. Woodhouse is said to be responsible in no small measure for Congressional implementation of the Bretton Woods plan for a world bank and world fund. She fought for it in committee, on the floor of the House, and before audiences throughout the country. She fought long and hard, also, for the retention of price control. In November she called a meeting of the Congressional Committee for the Protection of the Consumer, with Representative Aime Forand as chairman. She had visited London, Paris, Copenhagen, and Stockholm, observing the effects of inflation, and on her return in the fall reported, "Only the fighting is over. We have still got to win the war. And winning the war means working out a system of economic cooperation between nations." In a debate over OPA, when Republican Senator Kenneth S. Wherry displayed garments to illustrate his contention that the OPA was causing lowered quality, Mrs. Woodhouse reminded the audience that the Senator had voted against quality control, and also that low quality garments could not be attributed to high wages because the textile industry was one of the lowest-paid.

The Canadian-born Congresswoman was generally in favor of President Truman's '45 legislative program, but objected to the part of the Wyatt housing program intended to channel scarce materials into houses costing then not more than ten thousand dollars. She told reporters that the upper limit was too high for returning veterans. "What we need are houses to sell below sixty-five hundred dollars and to rent at fifty dollars or less," she asserted. She also warned against bringing American troops home too quickly and thus hindering policing of occupied territory, pointing out that her own son had been in the Pacific more than forty months: "Yet I am willing that he stay as long as necessary, rather than have his son sent there to fight twenty-five years from now." Without taking a position on peacetime conscription as such, she "debunked" the pro-conscription argument on health and educational grounds, stating that the age of eighteen was too late for that training, that what was needed were prenatal clinics, child welfare agencies, and more and better schools in all parts of the country; and that the best preparedness would be the elimination of Army rejections by developing physically fit men.

"As a long-time active campaigner," wrote one pre-election commentator, "Mrs. Woodhouse enjoys seniority in party activities and in association with legislative groups which should make her a valuable and effective Representative." No "glamour girl" like her Republican colleague from the Nutmeg State, Clare Boothe Luce '42, Mrs. Woodhouse is slight of frame; her hair is white, and her eyes are gray. Her religious affiliation is Episcopalian. Unable to find a suitable apartment in crowded Washington, the economist finally bought an old house in suburban Georgetown. Fortunately, her hobby is "doing over" old houses.

WRIGHT, (SIR ROBERT ALDERSON WRIGHT), LORD Oct. 15, 1869- Chairman of the United Nations War Crimes Commission; jurist

Address: b. House of Lords, London; h. 48 Hornton St., London

In January 1945 the sixteen-nation United Nations War Crimes Commission, which acts as a sort of international grand jury, elected the Right Honorable Lord Wright as its chairman. Lord Wright, more formally Baron Wright of Durley, is a distinguished lawyer, a member of the highest British tribunal, who is entitled to place after his name the initials K.C. (King's Counsel), P.C. (Privy Councillor), J.P. (Justice of the Peace), and F.B.A. (Fellow of the British Academy). Knighted in 1925 as Sir

Robert Alderson Wright, the jurist became in 1932 one of England's law lords, a life peer.

Lord Wright was born Robert Alderson Wright, the son of John and Elizabeth Middleton (Carr) Wright of South Shields, in England's North Country. The date was October 15, 1869. He was educated privately, and started his professional life, according to the British *Illustrated*, as a schoolmaster. Wright entered Trinity College of Cambridge University, receiving his B.A. in 1896, at the age of twenty-seven. In 1899 he was made a Fellow of the College, which he remained until 1905, meanwhile acquiring his M.A. in 1900. Wright had been studying law at the Inner Temple, perhaps the most famous of England's four inns of court (the combination law schools and bar associations to one of which all barristers must belong, and which alone possess the power of calling to the bar and disbarment). In 1900, when he was thirty-one, the future peer was called to the bar and entered the practice of law.

"There is no aspect of the law," to quote a British magazine, "in which Lord Wright's penetrating and analytical mind is not well versed." In 1917 he "took silk"—applied for and received letters patent from the Lord Chancellor as a King's Counsel, "one of His Majesty's counsel learned in the law," which made official his position as a leading barrister. Six years later he became a bencher of the Inner Temple; the benchers pass on the applicants for admission, and for sufficient cause, subject to appeal to the judiciary, may refuse to call offenders to the bar or may disbar or disbench them. In 1925 Wright was knighted and appointed a judge of the High Court of Justice, King's Bench Division. While in this post, Sir Robert was married to Margery Avis Bullows of Sutton Coldfield; this was in 1928, when he was fifty-nine.

In 1932 Sir Robert Wright was made a Lord of Appeal in Ordinary—a member of the highest judicial tribunal of the United Kingdom, and, as such, of the Judicial Committee of the Privy Council, which is the highest court of the British Commonwealth of Nations. The Lords of Appeal are made life peers (nonhereditary), with seats in the House of Lords, and Sir Robert was created Baron Wright of Durley in the county of Wiltshire. He continued to serve as a Lord of Appeal until 1935: then he became Master of the Rolls, a position ranking next after the Lord Chancellor and Lord Chief Justice, and also became chairman of a Royal Commission on Historical Monuments. Since 1937 Lord Wright has again been a Lord of Appeal. His *Legal Essays and Addresses* were published in 1939, and in 1940 he was elected a Fellow of the British Academy.

In July 1944 the High Commissioner appointed Lord Wright to represent Australia on the sixteen-member United Nations War Crimes Commission, a fact-gathering agency with no official authority to conduct trials or determine policy. In January 1945 the commission chairman, Sir Cecil Hurst, resigned, "partly for ill-health," in the words of John MacCormac in the New York *Times*, "and partly because he could get no cooperation from the Foreign Office"; the American member, Herbert C. Pell, was released by his Government; and Lord Wright was elected chairman. (Pell declared that he had been dropped because certain State Department officials opposed his proposal to hold the Nazis criminally responsible for offenses against their own nationals on the grounds of race, creed, or political opinion, and he stated that Sir Cecil Hurst had a similar complaint.)

British Official Photo.

LORD WRIGHT

In Lord Wright's words: "When the United Nations War Crimes Commission was charged with investigating crimes . . . what it had to do was to 'investigate' the statements sent in to it in order to report whether a prima facie case of war crime was shown, and report it to the governments accordingly. . . .It was thus necessary to have some body or bodies to conduct the detailed detective inquiries in the appropriate localities. That duty was imposed on the National Offices . . . established and maintained by each of the United Nations. . . .The whole idea of the system was that the United Nations should each do its own work in bringing to justice those enemies who had committed offenses against its nationals. . . .The primary function of the military [in this connection] was to apprehend the criminals named in lists issued by the Commission. . . .The Commission has [also] power to act on its own initiative in listing offenders and has done so in its Seventh and Ninth Lists of Key Criminals. . . .It is also a central clearinghouse for the records and is thus able to classify and compare the cases and frame general charges of conspiracy in crime. . . .The Commission stands as the public embodiment of justice and of international law in the particular sphere of war crimes.

"The special feature of the Nazi or Fascist crimes is that they are not merely done on an unprecedented scale over the whole range of military operations and enemy occupation, but that they exhibit every trace of a general scheme; they all clearly emanated from a master criminal and his entourage and were carried out according to plan by elaborate organized agencies and instrumentalities—that is, by

WRIGHT, LORD—*Continued*

individuals acting under common direction and in common concert. This mass criminality has been forced on the attention of the Commission and has caused them to consider special methods of dealing with it. In particular, experience has made the Commission realize that membership in a particular organization which has systematically organized and effected the perpetration of atrocities is prima facie evidence of guilty complicity. I say prima facie, because it might be possible for an accused member to show that he was in no way implicated. . . . The Commission is acquiring the material to compare and classify, to point to common features, and to trace the crime from the actual perpetrators to the central mind or authority, such as Hitler '42 or Goering '41, right through the intermediate agencies, often by a chain of orders or directives passing down the line, and to analyze the element of common purpose or conspiracy. . . .They are all manifestly part of a systematic plan to crush and degrade and dehumanize the spirit of the peoples who are attacked, if not to exterminate them. . . .The Commission has positively declared its view that obedience to superior orders is not a defense and that heads of states are not immune. This last is a curious revival of the old bad idea of the divine right of kings."

Lord Wright also expressed his hope that the Commission would coordinate its work with that of the equivalent Soviet group, and in May 1945 the Commission submitted a proposal for an international tribunal to try the "arch-criminals" whose crimes affected nationals of many different countries. On August 8 the War Crimes Commission in London announced a pact, the Jackson agreement, establishing an International Military Tribunal to try the major European Axis war criminals. The Tribunal will consist of four members—one each from Britain, the United States, Russia, and France. Lord Wright published an article in the New York *Times Magazine* of October 28, 1945, in which he discussed the legal basis for bringing war criminals to justice.

The white-haired, beetle-browed judge is described as "a tower of strength in our [British] supreme legal tribunal." He has been awarded honorary LL.D.'s by the universities of London and Birmingham as well as Cambridge, of which he is Deputy High Steward; he also is an honorary Fellow of Trinity College. Since 1934 he has been a member of the Universities Committee of the Privy Council, and he is on the Visiting Committee of Harvard Law School in the United States, where he has often lectured on jurisprudence. Wright is a member of four clubs. "To his mental powers," it is said, "he can add physical prowess of which any man many years his junior might well be proud . . . is still a fine sportsman," and "performs without difficulty the acrobatics necessary when he has to search ceiling-high shelves for works on international jurisprudence." The Wrights, whose household includes eight assorted live dogs as well as many animal statuettes, are fond of horseback riding. (Lady Wright has won competitions in the United States and Canada.) The Baron is a believer in the public's right to information: "Secrecy," he has said, "is always undesirable if it can be avoided."

WRIGHT, THEODORE P(AUL) May 25, 1895- United States Government official

Address: b. Civil Aeronautics Administration, Pentagon Bldg., Washington, D.C.; h. 2918 Glover Driveway, N.W., Washington, D.C.

Theodore P. Wright, head of the Civil Aeronautics Administration since 1944, has had a long career in the field of aviation. An aeronautical engineer as early as 1921, he was called to Washington a score of years later to aid in the defense program and, subsequently, after Pearl Harbor, was assigned an important part in the direction of the aircraft production program.

The son of Philip Green and Elizabeth Quincy (Sewall) Wright, Theodore Paul Wright was born on May 25, 1895. He spent the first twenty years of his life in his native town of Galesburg, Illinois, where he attended Lombard College. He received his Bachelor of Science degree from that college in 1915, and three years later was graduated from the Massachusetts Institute of Technology with a Bachelor of Science degree in architectural engineering. (In 1937 he was awarded the honorary degree of Doctor of Science by Knox College in Galesburg in recognition of his "distinguished services to aeronautics.")

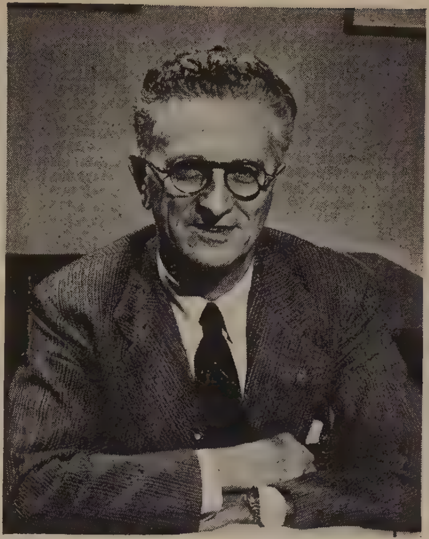
His education completed, Wright was commissioned as ensign in the United States Naval Reserve Flying Corps shortly before the First World War ended and assigned to duty as an inspector of naval aircraft. Two years later he was promoted to the rank of lieutenant and appointed superintendent of construction of naval aircraft for the New York district. The Garden City (Long Island) and Buffalo plants of the Curtiss Aeroplane and Motor Company were included in the New York area, and Lieutenant Wright was responsible for the inspection of the Navy-Curtiss flying boats then under construction at the Garden City plant. (The Navy-Curtiss was the first plane to make a transatlantic flight.) There is a story told of Wright's devotion to his work in connection with this ship. Late one night, before the NC was finished, the general manager and chief engineer of the plant decided to have an undisturbed look at their history-making plane. When they arrived at the deserted factory, they were surprised to find a light burning in the hull of the plane. Suspecting the worst, they were therefore relieved when investigation disclosed not an intruder but the young Navy lieutenant busily examining some construction that he could not have inspected during the day without holding up production.

Wright's ability and zeal caused the company to offer him a position when the Navy project was completed and in 1921, after receiving his discharge from the Navy, he joined the Curtiss Aeroplane and Motor Company as an executive engineer. The next year he was the assistant manager of the Buffalo factory, and in 1923 he became the assistant to the chief engineer. Two years later he was promoted to chief engineer of the airplane division, a position he continued to hold after the company became known as the Curtiss-Wright Corporation in 1928. He became vice-president of the corporation in 1930 and was general manager and chief engineer of the Buffalo plant from that year until 1934, when he was transferred to New York to take the posts of director of engineering and chairman of the Engineering Policy and Planning Board. By 1941, when he severed his industrial ties in order to give his time to national defense, he had become the vice-president of the Curtiss-Wright Corporation, of the Reed Propeller Company, and of the Wright Aeronautical Corporation, which comprised the largest aircraft organization in the world.

While Wright was a chief engineer many of the best-known Curtiss planes were produced under his supervision. There were Pulitzer and Schneider cup winners, and such famous military designs as the Hawk, Falcon, Helldiver, Shrike, and Condor. From 1928 until 1930 his experimental laboratory concentrated on the development of civil aircraft, producing in 1929 the Tanager, the plane which won the hundred-thousand-dollar prize in the Guggenheim Safe Aircraft Competition of that year. Other commercial types were the Robin, Fledgling, Kingbird, and Commercial Condor. In 1931 the laboratory staff at Garden City was moved to Buffalo to combine with the research group functioning under Wright's direction. It was also during that period that he devised his "Project Engineer" system of aircraft design, development, and manufacture which has been adopted by almost every important aircraft organization in the United States as the standard method of production.

In the spring of 1940 Wright took a six months' leave of absence from his business duties to go to Washington as a consultant to the National Defense Commission at the request of William S. Knudsen '40, head of the commission. Working with the Army and Navy as well as with other industrial leaders, Wright helped lay the foundation for the orderly expansion of industry to meet war needs. When his leave expired he went back to Curtiss-Wright for a few months; then, shortly before Pearl Harbor, he resigned from his position and returned to Washington to work as assistant chief of the aircraft section of the Office of Production Management. When that agency became known as the War Production Board in December 1942, he organized the Aircraft Resources Control Office, of which he was made director on March 6, 1943. The ARCO served as executive agency of the Aircraft Production Board (of which he was also a member); coordinator of production of airframes, engines, and propellers; supervisory agency of the Aircraft Scheduling Unit at Dayton, Ohio; and liaison office between the Army and Navy Air Forces and the War Production Board. In an editorial in the April 1943 issue of *Aviation* Leslie E. Neville approved Wright's appointment by saying: "The Army, the Navy, the aviation industry, and the Nation have reason for a deeper feeling of confidence in the military aircraft production program than they have ever had before."

Wright was well prepared to solve the complicated problems involved in directing the American aircraft production program during the Second World War. He was not only thoroughly familiar with airplane production in the United States, but he had made a careful study of conditions abroad, having visited factories in England, France, and Germany in the years 1934 through 1938. For his service during the war he received the War Department's highest award to civilians, the Medal for Exceptional Civilian Service, with a citation which reads: "In recognition of his outstanding contribution to the expansion of aircraft production by assisting in the equitable resolution of the many difficult and urgent problems of aircraft scheduling, standardization, and allocation. His development of useful methods for measuring manpower utilization and production efficiency has been of material assistance to the successful prosecution of the war."



THEODORE P. WRIGHT

On September 20, 1944, Wright's appointment as head of the Civil Aeronautics Administration, replacing Charles I. Stanton, was confirmed. Commenting on Wright's nomination, Scott Hershey, in an *Aviation News* article, said, "The fact that Wright is willing to leave his aircraft production post was taken in Washington as an indication that the plane production situation is well in hand. . . .It is known that Wright felt his job was not completed until the invasion of Europe was an assured success and that the production program was such that there would be ample aircraft for future Pacific operations." William A. M. Burden, then Assistant Secretary of Commerce, approved of the President's choice as "an outstanding step in preparing American civil aviation."

Among Wright's functions as administrator of the CAA is the encouragement of private flying, that is, the flying of planes by individuals as distinguished from commercial airlines. He feels that flying can be made feasible for a large number of people in the country if Federal agencies and private industry will cooperate. "Aviation cannot fly profitably and

WRIGHT, THEODORE P.—*Continued*

successfully without these two wings of support," said Wright in his article "Our Plan the development of civil aviation. It includes: April 1945 issue of *Flying*. In the article he outlined his own six-point program to facilitate the development of civil aviation. It includes: the mass production of a satisfactory personal airplane, safe and easy to fly; the construction of many simple and conveniently located airports; simplification of the regulations governing flying; an educational system similar to the old Civilian Pilot Training Program, to be sponsored by the Government; a campaign to make the general public airplane-conscious; and the development of a private airplane that will be superior to and cheaper than any yet built. Wright has organized an advisory group on nonscheduled flying to assist him in planning increased private flying.

Wright has contributed extensively to aeronautical literature on subjects ranging from aerodynamics to production problems and aviation's place in civilization. In 1930 the Society of Automotive Engineers, of which he is a member, awarded him the Wright Brothers Medal for his paper, "The Tanager—a Safe Airplane." "The Truth About Our National Defense Program," an article published in *Aviation* January 1941, sets forth America's need for defense measures, and methods for achieving them, and it won for the magazine the Industrial Marketing Award of Merit for the best article or editorial published in a business magazine during the period from August 1, 1940, to July 31, 1941. Another of his articles, "America's Answer," which appeared in *Aviation* in June 1939, was an answer to President Roosevelt's '42 request for the production of fifty thousand planes a year. In it Wright analyzed the capacity of the American aircraft industry to produce and showed how output might be increased to meet the needs of national defense. Some of his other articles are "Trends in Air Transport," "Winged Victory," and "50,000 Planes a Year," all of which were published in *Aviation*.

The aeronautical expert is well known in international aviation circles for his Wilbur Wright Memorial Lecture, "Aviation's Place in Civilization," which he delivered at the annual meeting of the Royal Aeronautical Society in London in May 1945, and for his participation in the United States Strategic Bombing Survey, which was formed to study the results of the strategic bombing of the Eighth Air Force in Europe during the war. In November 1944 he served as technical secretary of the International Civil Aviation Conference held in Chicago. After thirty-seven days and nights of work he produced a set of rules for safety in world air-transport operation which were adopted by the delegates to the conference.

Wright, who learned to fly in 1917, is a member of the Society of Automotive Engineers, former president and Fellow of the Institute of Aeronautical Sciences, and honorary Fellow of the Royal Aeronautical Society. He was married to Margaret McCarl in 1918; and their two sons are Douglas Lyman and Theodore Paul. Wright is of medium height, has graying light brown hair, and is described as "easy to talk to." When he was vice-president and general manager of the Curtiss plant in Buffalo, he took orders from the blueprint boy—when the boy was captain of the basketball team and Wright was one of the players.

WU YI-FANG (wo͞o yĭ-făng) Jan. 26, 1893- Chinese educator; religious leader; Government adviser

Address: Ginling College for Women, Nanking, China

The first and only woman college president in China, Dr. Wu Yi-fang has broken precedent in other ways. She is also the first woman to head the National Christian Council, having charge of all work by Christian bodies in the country; the first woman to be elected to the five-member presidium of the People's Political Council, making her the incumbent of the highest office held by any Chinese woman; and perhaps the leading worker for women's rights and education in all of China. Dr. Wu has represented her country abroad, having been a delegate to international conferences in Canada, England, India, and the United States, most recently at the San Francisco conference of April-June 1945.

Wu Yi-fang (the surname is placed first, Chinese fashion) was born on January 26, 1893, in Wuchang, Hupeh province, in northeastern China. Her father was a scholar and Government official, holding posts in Wuchang and northern Hupeh. A maternal uncle established one of the first girls' schools in China. As a young girl under the guidance of her older sister she read new books and pamphlets urging reforms, and in 1907, when the first schools for girls were authorized by imperial edict, she was enrolled in the newly established Hangchow Girls' School. During the next seven years she also attended the Laura Haygood Girls' School in Soochow and the Union Hangchow Girls' School. Then, in 1914-15, although only eighteen years old, Miss Wu became a teacher of English in the Girls' Normal School of Peking. Approximately a year later, in February 1916, however, she resigned the position to enter Ginling College for Women, a Protestant missionary school opened only half a year earlier and the first institution in the Yangtze Valley to offer work of college grade to women. A better than average student in all her subjects, and especially interested in science, she completed the course in three and a half years, receiving her B.A. in 1919 as a member of Ginling's first graduating class. While at college, in 1918, Miss Wu had been converted to Christianity.

Upon graduation Miss Wu had been offered an assistantship at Ginling, but she accepted instead the position of professor and head of the department of English at the Peking Higher Normal School for Girls. This she held until 1922, during a period marked by a literary renaissance, the beginning of Russian influence, and a rise in anti-Christian propaganda. Then, in the latter year, having been awarded a Barbour Scholarship to the University of Michigan, she left for the United States to pursue graduate studies in biology. In addition, she was active in American student affairs, being chairman of the Chinese Student Christian Association in the United States in 1924-25 and vice-chairman and acting chairman of the Chinese Student Alliance in North America in 1925-26. She had received her Master's degree from Michigan in 1924, and her Ph.D., for which she had written a dissertation entitled "A Contribution to the Biology of Simulium," was granted in 1928. That same year, abandoning her plans to teach biology when she returned to China, she accepted the presidency of Ginling College, becoming its first Chinese president when thirty-five years of age.

During the next nine years, the college underwent a "brilliant development." The enrollment doubled; new buildings were added to the campus; the curriculum was enlarged and modified to meet China's needs. Dr. Wu became known as a progressive Western-style educator and as the leading exponent in patriarchal China of the Occidental ideas of equal rights and education for women. (She has said, however, that she would be satisfied if women were given a fair chance in "a few special suitable fields," particularly education and social work.) In doing "man's work" she warned her girls against aping masculine styles and manners. To quote Delos Lovelace, "she approves of independence. She is glad that nowadays a girl in China may announce her own engagement to the boy friend of her own picking. But she holds that the announcement should have the feminine touch."

Miss Wu was also active in international goodwill and national Christian work. In 1929, 1931, and in 1933 she was one of the Chinese delegates to the Institute of Pacific Relations conferences, and in the latter year to the International Congress of Women in Chicago. Two years later, and again in 1937, she was elected chairman of the National Christian Council, China's coordinating body for Christian activities, with which she had been connected since 1928. During the years of the civil war and of Japanese aggression, which began in 1931, her position was "of tremendous responsibility, because of the intricacy of the problem involved." She also worked with Mme. Chiang Kai-shek '40, wife of the Generalissimo and a leader in her own right, in the New Life Movement, an organization devoted to national improvement through "courtesy, honesty, honor, service"—plus sanitation, social work, and the greater application of science. She and Mme. Chiang are also considered "mainly responsible for drawing China's women into their present widespread relief organization," the National Women's Association for War Relief.

When the official Sino-Japanese War began in 1937, Miss Wu was forced to flee, with her entire college, from the Japanese Army which was approaching the capital. From Nanking, Ginling moved some fifteen hundred miles to Chengtu, where three other refugee colleges had found quarters on the West China Union College campus. Despite "incredible difficulties," Dr. Wu succeeded in organizing this exodus and reorganizing the college in temporary buildings. While a Japanese garrison was quartered on the Ginling campus, the students and teachers continued their work in Chengtu. They suffered from the loss of much equipment, and from the scarcity of books, materials, and even food and clothing; but the student body grew to an unprecedented three hundred (the percentage of women enrolled in all Chinese colleges and universities had jumped 10 to 20 per cent by 1943). Dr. Wu's girls used their studies in child welfare, rural sociology, adult education, and similar fields, by setting up nutrition, sanitation, and child-care projects in Szechuan Province.

Chinese Ministry of Inf.

WU YI-FANG

"In Chengtu," to quote the Chinese News Service, "Dr. Wu is known to Government officials and kindergarten children alike. She sits on advisory boards, consults constantly with the Governor of the Province and with his economic and social welfare departments. In her office on the campus of Ginling College, she has a steady stream of visitors, only some of whom have to do with the administration of the college. Many of them are Government officials and war committee workers who seek her advice and support for their projects." In 1936 she represented Ginling at the Harvard Tercentenary, one of eighteen women at the ceremonies. In December 1938 she headed China's delegation to the International Missionary Congress at Tambaram, near Madras, India, probably the first woman, it is said, to lead a national deputation to a world convocation. That same year she was made a vice-chairman of the International Missionary Council and became a member of the Chinese People's Political Council, an advisory body to the Government; and in 1940 she was elected to its Presidium, becoming one of five presidents, the first woman so honored. This is described as the highest public office held by a woman in China. (Mme. Chiang had in the

WU YI-FANG—*Continued*

past headed the Air Force, and Mme. Sun '44 had also occupied an important post.)

In the spring of 1943 Miss Wu was the only woman member of a mission of educators and scholars sent to the United States to study various aspects of international relations and postwar reconstruction. "It is time to be thinking of the new world that lies ahead," said Dr. Wu, at a time when her country was in its sixth year of war. While in America she was awarded an honorary LL.D. by Smith College. Two years later she was similarly honored by Mills College and by the University of Southern California. This was when she was at the history-making United Nations Conference on International Organization, as the one woman in the ten-member Chinese delegation at San Francisco. (Some years earlier she had been the first woman to receive an honorary D. Sc. from St. John's University in Shanghai.) In 1940 she was co-editor of a symposium, *China Rediscovers Her West.*

The active Chinese educator is described as "small and thin and full of drive," "sharp-eyed behind spectacles but tactfully feminine amid so much masculinity." Like her countrywomen, Mmes. Chiang and Sun, she causes many western newspapermen to grow lyrical, the following description taken from the *Christian Science Monitor* being typical: "Miss Wu has the graces traditional to her countrymen: the impeccable courtesy, the disciplined composure, the nimbleness of wit and sagacity of heart," plus a "quality of vision, a vitality and steadfastness of spiritual conviction, that perpetually and incalculably marks the difference between intellectual and moral leadership. . . . Each phrase, each economical gesture, seemed margined with serenity, so that never, one felt, could she be jarred outside of the composure that she so luminously embodied."

WYNN, ED Nov. 9, 1886- Actor; producer; author

Address: h. Hollywood, Calif.

An "epic fellow of fabulous stature", "one of the ten most charming men in the world," "strangely sweet"—these are some of the words critics have used to describe comedian Ed Wynn. Besides a mastery of clowning, Wynn has a talent for writing and composing. He has written and produced the book, music, and lyrics of three of the eighteen Broadway shows in which he has appeared; collaborated on several others; authored and produced seven complete vaudeville acts; and has written the words and music of some hundred published songs. His other accomplishments include crossword puzzle construction and the writing of a column which was syndicated for three years in one hundred and fifty newspapers. He is reportedly engaged in writing a book to be named "The Philosophy of a Fool," which will reveal the introspective side of this lisping, giggling stage figure, whose admirers range from Joseph Wood Krutch, erudite drama critic, to Earl Wilson, the self-styled "saloon" editor of the New York *Post.*

Born in Philadelphia, November 9, 1886, to Joseph and Minnie Leopold, Wynn was named Isaiah Edwin. (His stage name is derived from the two syllables of his middle name.) His father, then a moderately prosperous manufacturer and retailer of women's hats, was born near Prague; his mother was born in Constantinople (Istanbul), her father having been Rumanian and her mother Turkish. Apparently Wynn was born to comedy. As soon as he could walk he was trying on ladies' hats in his father's store, suspending all business with his droll mimicry of the customers. The first play he ever saw was that macabre study of a dual personality, *Dr. Jekyll and Mr. Hyde.* He loved it. After that, on days that he was to go to the theatre, his mother often found him sobbing, "I want eight o'clock."

Young Leopold attended Central High School in Philadelphia, but at fifteen ran away from home to join the Thurber-Nasher Repertoire Company as a general utility boy at twelve dollars a week. Between chores of taking care of trunks and passing out handbills, he played bits on the stage. His first role, described on the program as "an old retainer," was in *American Grit.* The company went broke in Maine, and young Ed crept home. His father put him to selling hats, which was not Ed's idea of congenial work.

When the youth ran away from home again he went to New York, teaming up with another aspirant, Jack Lewis, in an act called "Wynn and Lewis." They introduced this at a benefit show and were immediately engaged to play Broadway's then top vaudeville theater, the Colonial, at a salary of two hundred dollars a week. Their act played for ninety-eight weeks, and at the end of the run Wynn went on alone. At the age of nineteen he was a headliner in vaudeville, earning four hundred dollars a week. For eleven years he remained in vaudeville, except for a brief interlude in a Broadway musical, *The Deacon and the Lady* (1910). The producer and composer of the production was Alfred E. Aarons, father of a boyhood acquaintance of Wynn's who had persuaded the father to give the comedian a part in the show even though the elder Aarons, had thought Wynn was "not very funny." The play closed after sixteen performances, and Wynn returned to vaudeville, continuing as a headliner in acts he wrote himself.

In 1914 Ziegfeld put him in the *Follies,* where Broadway welcomed the comic. Cast in the 1915 edition of the *Follies,* Wynn found himself on the same bill with W. C. Fields. A feud developed between the two comedians. During his famous pool-table act Fields found

Bruno of Hollywood

ED WYNN

his laughs coming at the wrong time. At last he discovered Wynn under the table happily catching flies. For several years after this these "epic fellows of fabulous statures," to quote Richard Watts, never spoke to each other. Finally, when Wynn defended his fellow troupers in an impassioned speech during the actors' strike of 1919, Fields publicly kissed Wynn on the brow—and peace between them was declared.

Beverly Smith says the strike almost broke Wynn's career, but ended by making his fortune. He "was making seventeen hundred dollars a week, but he threw down his tools—three hundred hats and fifty costumes—and walked out with the chorus girls and humbler sort of actors who were striking for better wages and working conditions. When the strike was won Wynn got a testimonial signed by 2,020 grateful actors and actresses." He was one of the few casualties of the strike which had included the Barrymores and almost all the leading stars of the day. Under contract to the Shuberts when he went on strike, Wynn was kept off the stage, first by an injunction, and later by a boycott from the Shuberts, who controlled the booking of New York theaters. The comedian brooded awhile, then closeted himself and wrote a whole show—songs, music, jokes. He drew his savings from the bank, picked up old scenery, and staged *Ed Wynn's Carnival* (1920), which ran for 116 weeks on Broadway. *The Perfect Fool* (1921) and *The Grab Bag* (1924) were also his creations. *The Perfect Fool,* his most successful role, played for 256 performances in New York, and then served Wynn as a road show until the season of 1924.

Although all of Wynn's Broadway roles did not win the acclaim that *The Perfect Fool* received, for twenty-five years every Wynn show was a box-office "honey" and there was not a single unfavorable notice. Joseph Wood Krutch, writing in the *Nation* of Wynn's power to send him into "paroxysms of mirth," said: "No one can exceed him in solid, impenetrable asininity, but no one can, at the same time, be more amiable, well-meaning, and attractive. Nature gave him a large and solemn face which seemed to promise an unending series of well-intentioned blunders, and his art succeeds, somehow, in giving the impression that his career has been more the result of following with an admirable consistency Polonius' excellent advice—'To thine own self be true.' "

In his radio work Wynn, contrary to custom, always works in costume. It has been said that his comedy make-up has more effect on his mood than upon his audiences. Unlike most comedians, Wynn uses entirely different voices on the stage and radio. On the stage the lisp is more pronounced, the treble always threatening, but never quite forthcoming; on the radio he shrieks in a hysterical falsetto. This change is all the result of a misapprehension on his part. Wynn had made his radio debut in the pioneer days of broadcasting, when he put his entire two-and-one-half-hour musical, *The Perfect Fool,* on a WJZ program, and his voice had then reached only New York audiences; his first experience on a national hookup was in 1932 when he appeared as the Fire Chief for Texaco. Just before the première of this program Wynn was told that he had an audience of twenty-nine million, whereupon he shrieked anxiously into the microphone with such comic effect that he continued to use the same pitch and volume on the radio. The Texaco program for three years (1932-35) was rated one of the most popular programs on the air. In it Wynn introduced the trick of combining his comedy with the sponsor's message. Wynn would break in on Graham McNamee's praises of the value of Texaco oil for automobile use with a quip, such as, "I'll stick to my horse—he doesn't have to be repainted every year."

In 1914 Wynn was married to Hilda Keenan, the actress-daughter of Frank Keenan, the Irish-American actor who for more than twenty years played leading roles in such well known productions as *The Girl of the Golden West, The Christian,* and *The Warrens of Virginia.* Their one child is Keenan, who has gained recognition as an actor in character roles in *See Here, Private Hargrove* and other films. He has been the absorbing interest in Wynn's life. When touring the comedian often traveled three hundred miles to see Keenan on Sundays. "On Sunday afternoons," says Wynn "my little friend and I would sit and talk things over. He was much steadier than I was, his judgment much more solid." (Early in 1945 Ed Wynn bought a home in Bel-Air, Hollywood, to be near his son.)

In 1937 Wynn was divorced by his wife, and a month later he was married to Frieda Mierse, a showgirl. The second marriage ended in divorce in 1939, and financial troubles followed the marital ones: a radio chain Wynn had backed failed with a loss of $300,000; and income tax difficulties reportedly brought his losses close to a million dollars. A nervous breakdown resulted in the retirement of America's Perfect Fool. "I can never be funny again," he told his son, who tried for seventeen months to bring the comedian out of his depression. (There have, in fact, always been two Ed Wynns—the giggling, befuddled clown of the stage, and the saddened, bedeviled, self-distrustful man who says in explanation of this off-stage Wynn, "Maybe I use all my

WYNN, ED—*Continued*

happiness on the stage.") One night Keenan persuaded his father to dine out with him. Some college boys at a table close by recognized Wynn and asked him when he was going to put on another show. Young Wynn saw his father give a smile in response—his first in many months.

When Wynn returned to Broadway in *Boys and Girls Together* (1940), critics who had hinted that the comedian was through were forced to admit that his new show was one of his best. "It is funny to the point of tears," said Brooks Atkinson '42. "It is the peak of Ed's career." Highspots of comedy (Wynn wrote the book) were: the introduction of his cast as graduates from a showboat with, "I bred my cast upon the waters"; an exit line, "I'll be back in a flash with more trash"; the use of an eleven-foot pole for people he wouldn't touch with a ten-foot pole. This last is a veteran among the Wynn gags—he is not averse to repeating a good one.

Wynn's comeback as "King Bubbles" in the radio program *Happy Island* (September 1944), over the Blue Network, was not so fortunate as his stage reappearance. Harriet Van Horne, New York *World-Telegram* critic, called the program as "flimsy a piece of whimsey as ever tangled a major talent." *Variety* found Wynn's delivery "sure and deft," but feared that the "sponsor identification" in the entertainment part of the program would prove "short-sighted." It was discontinued after three months and Wynn went back to his Purple Heart circuit, visiting GI hospitals in the United States.

Wynn sees in television an opportunity for actors and actresses to realize the high point of their careers. In speaking before the Television Broadcasters Association in December 1944, he declared that the thought of television's future had made him "get serious for the first time in forty-three years on the stage and radio. . . .The new art can be a thing more dangerous than dynamite or the quintessence of good, depending upon how it is managed."

Ed Wynn has never used off-color jokes, his humor having been consistently free from any suggestion of obscenity. While Wynn has devoted most of his life since 1904 to dispensing humor he admits he does not know precisely what humor is. "It is too subtle to be pinned down," he once said in an interview with S. J. Woolf. "I can say that it differs from wit, which exaggerates the truth, while humor presents the truth in an original way." Wynn calls himself a "method comedian"—he does not so much depend upon his material as he does on the method of putting it over. His comedy costume—a collection of zany hats, misfit clothes, and an oversized pair of shoes—has become a Wynn trade-mark. The hats have been changed with the productions, but the shoes are the ones he bought in 1907 for three and a half dollars—but repatched until not a bit remains of the original leather, for Wynn is so superstitious about the footgear that he will not make any stage appearance without them. Between engagements they are kept in a safe, and the repair over the thirty-seven years he has worn them has cost about three thousand dollars. Although Wynn has a gift for punning, he works hard over his gag lines. His library for the most part consists of joke books; when writing his comedy material he locks himself in a room and permits no one to disturb him. "It often takes hours," he says, "to think up something that is said in seconds."

Although Wynn has composed the score for three Broadway hits and has about a hundred songs to his credit, "his musicianship is rather circumscribed—he plays the piano in only one key, B-flat. However, Wynn creates the impression of a full, rich piano technique which fools some people into thinking that he is a thoroughly schooled musician."

The Wynn office is more like a museum than a business workshop. It is littered with wardrobe trunks, derelict costumes, and stage props. The walls are covered from floor to ceiling with testimonials, citations, awards of merit—and photographs of Wynn in his different roles from his sixteen Broadway shows, seven vaudeville acts, and two movies. (In 1933 Wynn, under contract to Metro-Goldwyn-Mayer, made *Follow the Leader* and *The Chief*.) There are mementoes and trophies, too: a gold cup for radio's finest performance in 1932; 127 firemen's badges as tribute to his radio character, the Fire Chief; and an autographed photograph from Woodrow Wilson for Wynn's work in the First World War. The star was the first to lead a Broadway company to Army camps in 1917. In the Second World War, Wynn made a tour of Army hospitals, while son Keenan went over "the hump" to entertain the armed forces in China and Burma. (In 1932 and 1933 Wynn's benefit broadcasts raised $82,000 for the relief of the unemployed.) The societies and clubs to which the comedian belongs are ASCAP, Authors' League of America, Dramatists, Actors Fund of America; and the Illinois State Board of Health elected him its honorary president.

Off the stage the comedian does not try to be waggish or witty. He talks seriously about his work, worries that his giggle may become too heavy (he speaks with a slight sibilance), while the well known curved eyebrows bob up and down "like waves on a sea" above his large shell-rimmed glasses. He is six feet tall and well built. His taste in clothes leans toward tweeds, red pajamas, and striped dressing gowns. Although he drinks moderately, he consumes five large black cigars during a rehearsal. His game of golf is fair, and he once owned an eighty-two-foot yacht. "I like boats," says Wynn. "When aboard I wear a captain's hat and a coat with brass buttons. It's marvelous how nautical I look. Without thinking a minute I can tell you the difference between the North Star and a movie star."

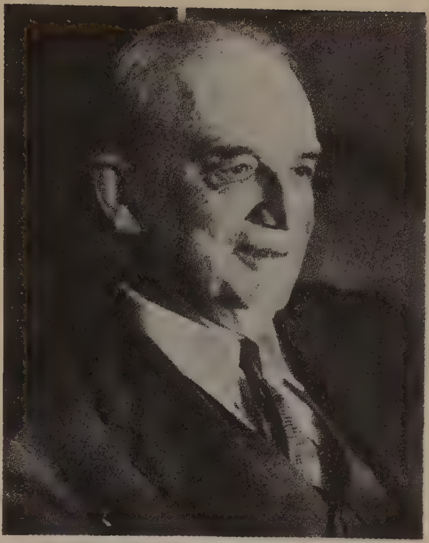
YOUNG, OWEN D. Oct. 27, 1874- Corporation executive

Address: b. General Electric Co., Schenectady, N.Y.; h. Van Hornesville, N.Y.

Known to the average student of history as chairman of the committee which devised the Young plan for the settlement of German reparations after the First World War, Owen D. Young has also served in the important capacities of chairman of the boards of General Electric Company and Radio Corporation of America, as well as of chairman or member of several Government committees. From farm boy to lawyer, executive, and diplomat, Young became one of America's foremost industrialists and public servants. He is recognized as one of the men responsible for his country's rapid industrialization, and he has received international acclaim for his work in the field of reparations.

Owen D. Young, the son of Jacob Smith and Ida (Brandow) Young, was born in Van Hornesville, New York, on October 27, 1874. His first American ancestor was Peter Young, a Protestant who had been driven from his home in the Rhenish Palatinate in the late sixteen-hundreds by French Catholics and had come to America in 1710. Owen, the son of a farmer, did his share of the chores in the home and fields and attended the little district school. Almost from the first, it is said, the boy was an unusual pupil. "The teachers were not accustomed to having pupils absorb what they gave them—soaking it in and asking for more—and this child seemed to be of that sort." Thus, after the boy's completion of grammar school at the age of twelve, his parents, although their means were relatively small, sent their son to the Academy of East Springfield, about five miles from Van Hornesville. Two years later he was graduated, the valedictorian of his class.

In 1890, at the age of sixteen Young entered St. Lawrence University, in Canton, New York, to prepare for the study of law. He had decided on this future in his early teens when one summer day he had gone to court to act as his uncle's witness in a controversy over a horse trade. "The cool of the courtroom, the appeal of the books, and the witty exchange of ideas," says Young, "made me determined . . . this is the life for me." At college he was described as "mentally alert, reserved, and master of himself and his surroundings." He was a leader in student activities, a business manager of the college newspaper, and through his efforts funds were raised for a college gymnasium. Much of his free time was spent attending sessions at the county court at Canton, where he observed the law in practice. In June 1894, when he was graduated from St. Lawrence, the prelaw student delivered the commencement address, voicing his thoughts on law and government: "The state is more than a mere utilitarian machine for the protection of life and property; it is a moral organization founded on the eternal principle of right to establish justice as the end for which it was created . . . right must be substituted for narrow and selfish principles; fairness and open-mindedness for senseless partisan abuse." At the university Young had met Josephine Sheldon Edmonds, and four years after his graduation they were married. They had five children: Charles Jacob, John (deceased), Josephine, Philip, and Richard. (Mrs. Young died in June 1935, and Young was married a second time, in February 1937, to Mrs. Louise Powis Clark.)



OWEN D. YOUNG

Young entered Boston University Law School in September 1894. He worked in the school library to meet his tuition fee, the small allowance he received from his parents merely covering his room and board expenses. Life was sometimes hard for the young student but he kept to his course. "I was doing the thing I wanted to do," he recalls, "and was too excited to mind that sort of thing." The second year, however, Young's financial problem was solved when he became a tutor to a wealthy law student. In 1896, having completed his three-year course in two years, he received his LL.B. degree *cum laude* and was again chosen the orator of the class.

Soon after being admitted to the bar in Boston that July, Young obtained a job as a clerk in the office of Charles H. Tyler, a lawyer who

YOUNG, OWEN D.—*Continued*

specialized in corporation and real estate cases. That same year he also secured a part-time position at the Boston University Law School as a teaching assistant to the lecturer on common-law pleading, a post he held until 1903. During his eleven years with Tyler his able handling of minutiae of trust estates, leaseholds, and property claims made him Tyler's right-hand man. Already in 1907 the law office of Charles H. Tyler had become the firm of Tyler and Young. With the large-scale developments of big business in the early nineteen-hundreds, the junior partner handled much of the legal work of electrical utility companies. Thus he became one of the best-informed advisers on utilities in the United States, skilled in adjusting disputes, in writing public utility contracts, and negotiating difficult transactions.

The year 1912 proved a turning point in the young lawyer's career. Young's defense of a client's rights to certain land contested by Bond and Share, then a General Electric subsidiary, brought him to the attention of Charles A. Coffin, president of General Electric. Impressed by the ability of the opposing counsel, Coffin invited Young to join the law department of his company, and Young, feeling that at General Electric he would have a chance to delve into "the no man's land of the law," accepted the offer. Accordingly, in January 1913 he became general counsel for the company. Shortly afterward he was put in charge of the law department, with the title of vice-president. He was particularly interested in the treatment of employees. Young has said: "I was shocked, outraged, when I found evidence that flimsy pretexts were being used for getting rid of workers when the real reason was that they were union men. I told the board I considered this the denial of man's constitutional right of association." Consequently, in 1918 he presented General Electric with a plan to effect closer cooperation between capital and labor.

In 1919, at the request of the United States Government, Young created the Radio Corporation of America in order to prevent American patents from falling into the hands of foreign companies. The Government was particularly concerned over the Alexander alternator, "a radio sending machine" invented in the General Electric laboratory, for which the British Marconi Wireless Company was negotiating. The sale of the alternator to the British company would have meant the supremacy of Great Britain in the radio field. In order to consolidate all electrical patents in the hands of one company, the newly formed RCA therefore took over the patents controlled by GE, United Fruit, American Telephone and Telegraph, Westinghouse, and General Motors, compensating these companies with shares in RCA commensurate with the value of their relinquished patents. Under Young's leadership RCA became known as the largest radio company in the world.

In 1919 the vice-president of General Electric first entered the field of public service. Upon President Wilson's request, Young joined the President's Second Industrial Conference to help formulate a plan to prevent industrial strife. One of the committee's important proposals was a national industrial board to handle all disputes that could not be settled by those immediately concerned. The chairman of the conference remarked that Young "seemed to be after the truth of things—no fear, no prejudice." In 1921, with a business depression in the offing, Young once again contributed his services to the Government, this time as a member of President Harding's Conference on Unemployment; and in 1922, at the suggestion of Herbert Hoover '42, President Harding appointed Young chairman of a committee to investigate the causes of business cycles. The following year the committee presented a report which was then considered the most thorough study on industrial stabilization yet made in the United States. In 1924 the economic adviser served as chairman of the American delegation to the international court of arbitration of trade disputes, a tribunal formed by the International Chamber of Commerce to facilitate the settlement of commercial controversies between firms of different countries. From 1925 to 1928 Young was also chairman of the International Chamber of Commerce.

In June 1922, upon Coffin's retirement, Young became chairman of the board of General Electric. A year and a half later General Electric gave him a temporary release when in December 1923 the Allied Reparations Commission, unable to cope with the German reparations problem, invited Young to join the newly formed Experts' Committee. Headed by an American, Charles G. Dawes, the commission was to determine Germany's capacity to pay reparations, and to devise a plan which would stabilize her rapidly depreciating currency and balance her budget. In May 1924, after six months of deliberation the committee's report, the Dawes plan, was completed, fixing the total sum of German reparations and method of payment. According to its framers, this plan was considered a temporary settlement. At the London Conference of Premiers in July Young's presence as a conciliator was thought largely responsible for the plan's acceptance by the Allied countries. Appointed Agent General ad interim the following month, Young set up an international bank which was to handle Germany's accounts and taxes. After the completion of this task in November Young returned to the United States to resume his business activities.

The Dawes plan worked successfully for more than three years and then was superseded by the Young plan. At the end of 1928 the Allied countries, agreeing to Germany's demand for a final settlement of the reparations problem, had appointed a new commission. Confident of Young's ability and fairness, the Allies drafted him to be chairman of the Second Committee of Experts, which convened in February of the following year. (The United States did not participate in this conference.) After much bitter wrangling among the representatives of Germany, France, England, Belgium, Italy, and Japan, in June the Young plan was launched. Germany's debt of twenty-five billion dollars was to be paid by 1988, payments to be made through the new Bank for International Settlements. Germany was to be free of Allied financial supervision and the Army of Occupation in the Rhineland was to be evacuated, beginning September 1929. The Allies floated a three-million-dollar loan to help finance her initial payment. ("In 1931 Hoover proposed a moratorium of one year for all payments on intergovernmental debts and reparations, and with some clarification the proposal was accepted. Since the expiration of this moratorium," states the *Columbia Encyclopedia* (1935), "no way has been found to secure satisfactory payments from Germany.") Of Young's part in the working out of this plan Thomas Lamont '40 has written, "His was a leadership that was never demanded by him, but was freely accorded to him by all his associates, because of their clear recognition of his fairness, his character, and his eminent capacity to be a leader of both affairs and men."

In 1929 Young relinquished his chairmanship of the board of RCA to become chairman of its executive committee (1929-33). A year later, when James G. Harbord '45 had become board chairman, the Supreme Court filed suit against RCA under the Sherman Antitrust Act, the charge being that it and other corporations had "created a patent combination . . . through which they exercise joint control over the radio industry." Young's viewpoint on government control, stated in 1931, was that "governmental organization is an inefficient and uneconomical instrument. . . .It is scarcely too much to say that the best of the publicly owned enterprises are comparable only with the worst of the privately owned concerns." In 1940, viewing the development of a decade and looking beyond the war, he declared: "The American system, having been through ten years of rapid change in which even dyed-in-the-wool conservatives of rapid change have learned to accommodate themselves to new conditions, is now newly supple and far more ready than ever before to cope with the confusions of war and its aftermath."

As an industrial leader, Young is seen as working continuously in the interest of labor. He is regarded as largely responsible for such innovations at General Electric as a system of employee stock plans, unemployment insurance, and a "cultural wage" (as opposed to a mere living wage). Young—of the opinion that "the world does not owe a man a living, but business, if it is to fulfill its ideal, owes men an opportunity to earn a living"—in 1931 presented Gerard Swope '41, president of General Electric, with a plan which "rather stunned" industry because of its "revolutionary features." The aim of the plan was to stabilize the entire electrical industry by uniting all its independent branches which employed fifty men or more into one unit. The whole industry was to operate according to rules established by a trade commission and was to be supervised by a Federal agency. An important feature of the plan was that "a uniform system of accounting, a free exchange of information, a balancing of production and consumption, and the insurance of workers in accident, sickness, and unemployment" were to be exercised by each firm in the association. Young pointed out that the stabilization of industry calls for the subordination of personal liberty to teamwork. "Too many people think that we can have an effective plan without paying anything for it," declared the industrialist.

The writers of the Swope plan, aware from the start that it would come into conflict with the Sherman Antitrust Act, hoped that the Supreme Court might sustain it if it were put into effect as a laboratory experiment under Federal supervision. However, the plan is still in its theoretical state. "The old notion," asserts Young, "that the heads of business are the paid attorneys of stockholders, to exploit labor and public in the stockholders' interest, is gone—I hope forever. Big business cannot be private business it it is to grow." "It is an institution," wrote Ida M. Tarbell, "of Young's conception"; its leaders are trustees . . . who have an obligation to everybody concerned in it, to the public which it must serve satisfactorily if it is to exist, to the workers from top to bottom who keep the institution not only going but growing, as well as to stockholders."

Interested also in youth and its problems, Young has devoted much time to the field of education. He believes that schools should place more emphasis on character and emotional development than on academic achievements. Among the findings of the American Youth Commission, of which he acted as chairman from 1936 to 1942, was this: "The community reaches its effectiveness in meeting the needs of young people in school and out, where there is some organization whose business it is to know and utilize all youth-serving resources, physical and organizational, at the community level." Young served also as a trustee of St. Lawrence University from 1912 to 1934, and was a member of the General Education Board and the International Education Board (1925-40), and in 1939 of the planning committee of the Conference on Children in a Democracy. He was also on the National Advisory Council of the National Youth Administration in 1940, and in 1945 is a member of the Board of Regents of the State of New York.

In April 1940 President Roosevelt '42 appointed Young, who had retired as chairman of General Electric in 1939, as head of a committee to survey the Nation's transportation problems. (The committee was supervised by the National Resources Planning Board.) After two years of study Young presented a report to the board on "the most economical and effective way of moving people and goods from one place to another." In 1941 he joined the National Patent Planning Commission, and the following year he became a member of the New York regional committee of the War Manpower Commission. After three years in retirement Young in 1942 resumed his duties as acting chairman of General Electric to supervise the manufacture of more than a billion dollars' worth of war orders held by the company. In the latter part of 1944 he retired once again, becoming honorary chairman of the board.

Young was awarded the gold medal of the National Institute of Social Sciences in 1925, and he also holds such foreign decorations as the Commander's Cross of the French Legion of Honor (1924), the Belgian Order of Leopold (1925), the First Order of the German Red Cross (1925), and the Order of the Rising Sun, fourth class, from Japan (1921). The executive has received the honorary degrees of LL.D., Litt.D., and D.C.S. (Doctor of Commercial Science) from more than twenty-five colleges in the United States. He is also an

YOUNG, OWEN D.—*Continued*

honorary member of several clubs and belongs to various fraternities and organizations.

The industrialist is described as "lank, dreamy, and gentle-spoken." He claims he is a farmer at heart, spending most of his time of late raising cows on his farm in Van Hornesville and reading books and magazines on agriculture. But he is a bibliophile, too, and in 1941 he presented a collection of rare books, autographed letters, and manuscripts to the New York Public Library. One thing he has shunned is politics, having continually refused to contest for a public office. More than a decade ago he asserted, "Isolation to America, either economic or political, is impossible. . . .Peace thrives in a world of contentment and mutual welfare. It cannot live in a world or nation where there are inequalities and injustices caused by man-made barriers." In 1944 he described Lend-Lease as "an invaluable factor in effecting successful economic settlement among nations after the war. . . .There is no vast accumulation of debt between the Allies. Lend-Lease has cared for that. That I regard as one of the greatest inventions of our time."

NECROLOGY—1945

This is an index to notices of deaths which occurred between November 10, 1944, and December 31, 1945. Deaths which occurred in late 1945 are recorded in early 1946 issues of CURRENT BIOGRAPHY; references to those issues are included in this index. See 1940-1944 Yearbooks for the necrologies for those years.

CUMULATED INDEX—1940 - 1945

This is a six-year cumulation of all names which have appeared in CURRENT BIOGRAPHY from 1940 through 1945. The date following each name indicates the monthly issue as well as the annual volume in which a biography or obituary is included. Please note that three of the 1940 references are not to monthly issues of CURRENT BIOGRAPHY: "Jan-Feb" refers to the combined number which covered the first two months of that year; and since the June and December numbers were not published in monthly form, "Jan-Jun" refers to June material contained in that six-month cumulation, and "Yrbk 40" refers to December material included in that Yearbook.

Abbott, Anthony See Oursler, F. Oct 42
Abbott, Berenice Jul 42
